

Micro Commercial Components 20736 Marilla Street Chatsworth CA 91311

Phone: (818) 701-4933 Fax: (818) 701-4939 1N5338B **THRU** 1N5369B

# Features

- Zener Voltage From 5.1V to 51V
- Epoxy meets UL 94 V-0 flammability rating
- Moisture Sensitivity Level 1 Lead Free Finish/RoHS Compliant (Note1) ("P"Suffix designates Compliant. See ordering information)
- Marking: Cathode band and type number

- Operating Temperature: -55°C to +150°C
- Storage Temperature: -55°C to +150°C
- 5 Watt DC Power Dissipation
- Maximum Forward Voltage @ 1A: 1.2 Volts
- Power Derating: 40 mW/°C Above 75°C
- Maximum thermal resistence: 25C/W from junction to ambient

# **Mechanical** Data

Case: JEDEC DO-15.

Terminals: Solder plated, solderable per MIL-STD-750,

Method 2026.

Standard Packaging: 52mm tape

5 Watt **Zener Diode** 5.1 to 51 Volts

#### NOTE:

- 1. TOLERANCE AND VOLTAGE DESIGNATION The JEDEC type numbers shown indicate a tolerance of+/-10% with guaranteed limits on only Vz, I<sub>R</sub>, I<sub>r</sub>, and V<sub>F</sub> as shown in the electrical characteristics table. Units with guaranteed limits on all seven parameters are indicated by suffix "B" for+/-5% tolerance.
- 2. ZENER VOLTAGE (Vz) AND IMPEDANCE ( $Z_{ZT}$  &  $Z_{ZK}$ ) Test conditions for Zener voltage and impedance are as follows; Iz is applied 40+/-10 ms prior to reading. Mounting contacts are located from the inside edge of mounting clips to the body of the diode( $Ta=25^{\circ C}$ )

#### 1N5338B THRU 1N5369B

- 3. SURGE CURRENT (Ir) Surge current is specified as the maximum allowable peak, non-recurrent square-wave current with a pulse width, PW, of 8.3 ms. The data given in Figure 5 may be used to find the maximum surge current for a quare wave of any pulse width between 1 ms and 1000ms by plotting the applicable points on logarithmic paper. Examples of this, using the 6.8v , is shown in Figure 6. Mounting contact located as specified in Note 3. (T<sub>A</sub>=25 °C).
- 4. VOLTAGE REGULATION (Vz) Test conditions for voltage regulation are as follows: Vz measurements are made at 10% and then at 50% of the Iz max value listed in the electrical characteristics table. The test currents are the same for the 5% and 10% tolerance devices. The test current time druation for each Vz measurement is 40+/- 10 ms. (T<sub>A</sub>=25C). Mounting contact located as specified in Note2.
- 5. MAXIMUM REGULATOR CURRENT (I<sub>ZM</sub>) The maximum current shown is based on the maximum voltage of a 5% type unit. Therefore, it applies only to the B-suffix device. The actual I<sub>ZM</sub> for any device may not exceed the value of 5 watts divided by the actual Vz of the device. T<sub>L</sub>=75Cat maximum from the device body.

#### **APPLICATION NOTE:**

Since the actual voltage available from a given Zener diode is temperature dependent, it is necessary to determine junction temperature under any set of operating conditions in order to calculate its value. The following procedure is recommended:

Lead Temperature, T<sub>L</sub>, should be determined from:

$$T_L = \theta_{LA} P_D + T_A$$

 $\theta_{LA}$  is the lead-to-ambient thermal resistance and  $P_D$  is the power dissipation.

Junction Temperature, T<sub>J</sub>, may be found from:

$$T_J = T_L + \Delta T_{JL}$$

 $\Delta T_{JL}$  is the increase in junction temperature above the lead temperature and may be found from Figure 4 for a train of power pulses or from Figure 1 for dc power.

$$\Delta T_{JL} = \theta_{JL} P_D$$

For worst-case design, using expected limits of  $I_Z$ , limits of  $P_D$  and the extremes of  $T_J$  ( $\Delta T_J$ ) may be estimated. Changes in voltage,  $V_Z$ , can then be found from:

$$\Delta V = \theta_{VZ} \, \Delta T_{J}$$

 $\theta_{VZ}$ , the Zener voltage temperature coefficient, is found from Figures 2 and 3.

Under high power-pulse operation, the Zener voltage will vary with time and may also be affected significantly by the zener resistance. For best regulation, keep current excursions as low as possible.

Data of Figure 4 should not be used to compute surge capability. Surge limitations are given in Figure 5. They are lower than would be expected by considering only junction temperature, as current crowding effects cause temperatures to be extremely high in small spots resulting in device degradation should the limits of Figure 5 be exceeded.

#### \*\*\*LIFE SUPPORT\*\*\*

MCC's products are not authorized for use as critical components in life support devices or systems without the express written approval of Micro Commercial Components Corporation.

#### \*\*\*CUSTOMER AWARENESS\*\*\*

Counterfeiting of semiconductor parts is a growing problem in the industry. Micro Commercial Components (MCC) is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. MCC strongly encourages customers to purchase MCC parts either directly from MCC or from Authorized MCC Distributors who are listed by country on our web page cited below. Products customers buy either from MCC directly or from Authorized MCC Distributors are genuine parts, have full traceability, meet MCC's quality standards for handling and storage. MCC will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. MCC is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.
