This complementary range of Power Module connectors, with 2.0 mm contact pitch, fulfills the need for miniaturized and high reliability power systems, and offers a large number of options for mezzanine applications. One of its unique features is its high current-carrying capacity in comparison to its small size. Therefore, the system is ideally suited for use with small, high performance devices such as CPUs, drives, LCD panels, etc. Providing a variety of height versions of the male and female connectors, the Power Module series enables stacking heights from 5 mm to 20 mm. Subsequently, almost every need for different PCB arrangements can be addressed. Another major advantage is the multiple-connector mating capability, which allows the mating of more than one connector pair at the same time.

The SMT connectors meet all the needs of fast automatic assembly machines. They are manufactured and 100% inline quality checked by machine to ensure high coplanarity and optimized soldering. The layout is designed with an optimal solder pad size to guarantee high retention forces. The integrated 3-point double beam female contact ensures durable low-contact resistance over the whole lifecycle.

The contacts are post plated, leaving no bare edges in the contact and solder areas. The connectors are equipped with polarized positioning pegs, and the connector plating is lead free, complying with the European RoHS directive.

Allowed misalignment tolerances longitudinal and transverse axes  $\pm 0.7$  mm

Allowed angular inclination tolerances longitudinal:  $\pm 4^\circ$ ; transverse:  $\pm 2^\circ$

Wipe length 1.5 mm / Board-to-Board distance 5-20 mm (including wipe length up to 21.5 mm)

All dimensions in mm.

Voltage rating	IEC60664	The permissible operating voltages depend on the customer application and on the applicable or specified safety requirements. Insulation coordination according to IEC 60664-1 has to be regarded for the complete electrical device. Therefore, the maximum creepage and clearance distances of the mated connectors are specified for consideration as a part of the whole current path. In practice, reductions in creepage or clearance distances may occur due to the conductive pattern of the printed board or the wiring used, and have to be taken into account separately. As a result the creepage and clearance distances for the application may be reduced compared to those of the connector.
