

General Description

The 870919I-01 is an LVC MOS clock generator that uses an internal phase lock loop (PLL) for frequency multiplication and to lock the low-skew outputs to the selected reference clock. The device offers eight outputs. The PLL loop filter is completely internal and does not require external components. Several output configurations of the PLL feedback and a divide-by-2 (controlled by FREQ_SEL) allow applications to optimize frequency generation over a wide range of input reference frequencies. The PLL can also be disabled by the PLL_EN control signal to allow for low frequency or DC testing. The LOCK output asserts to indicate when phase-lock has been achieved. The 870919I-01 device is a member of the family of high performance clock solutions from IDT.

Features

- Two selectable single-ended input reference clocks
- Eight single-ended clock outputs
- Internal PLL does not require external loop filter components
- 5V tolerant inputs
- Maximum output frequency: 160MHz, (2XQ output)
- Maximum output frequency: 80MHz, (Q0:Q4 and nQ5 outputs)
- LVC MOS interface levels for all inputs and outputs
- PLL disable feature for low-frequency testing
- PLL lock output
- Selectable synchronization of output to input edge
- Output drive capability: $\pm 24\text{mA}$
- Output skew: 300ps (maximum), Q0:Q4
- Output skew: 500ps (maximum), all outputs
- Full 3.3V supply voltage
- Available in lead-free packages
- -40°C to 85°C ambient operating temperature
- Fully pin and function compatible with the IDT QS5LV919 (including 55, 70, 100, 133 and 160MHz options)
- For functional replacement part use 8T49N285

Block Diagram

Table 1. Pin Descriptions

Number	Name	Type		Description
1, 13, 17, 20, 24	GND	Power		Power supply ground.
2	nQ5	Output		Single-ended clock output (phase is inverted with respect to other outputs). LVCMOS/LVTTL interface levels.
3, 15, 22, 27	V _{DD}	Power		Positive power supply pins.
4	OE/nRST	Input		Output enable and asynchronous reset. Resets all outputs. Logic LOW, the outputs are in a high impedance state. Logic HIGH enables all outputs. Internally a Power On reset circuit will ensure that the nQ5 output is inverted relative to Q[4:0]. If OE/nRST is pulsed low, it must be held low for a minimum of 10 ns for a complete reset operation. This reset may be applied asynchronously to the input reference.
5	FEEDBACK	Input		PLL feedback input which is connected to one of the clock outputs to close the PLL feedback loop. LVCMOS/LVTTL interface levels.
6	REF_SEL	Input		Input reference clock select. Logic LOW selects the SYNC0. Logic HIGH selects the SYNC1 input as the PLL reference input. LVCMOS/LVTTL interface levels.
7, 11	SYNC0, SYNC1	Input		Single-ended reference clock inputs. LVCMOS/LVTTL interface levels.
8	AVDD	Power		Positive power supply for the PLL.
9	nPE	Input	Pulldown	Output phase synchronization. In PLL mode (PLL_EN = HIGH) and when logic LOW, the rising edges of the outputs (2XQ, Q0:Q4, Q/2) are synchronized to the rising edge of the selected reference clock (SYNCn). In PLL mode (PLL_EN = HIGH) and when logic HIGH, the falling edges of the outputs (2XQ, Q0:Q4, Q/2) are synchronized to the falling edge of the selected reference clock (SYNCn). LVCMOS/LVTTL interface levels.
10	AGND	Power		Power supply ground for the PLL. Internally connected to GND.
12	FREQ_SEL	Input		Frequency select. Logic LOW level inserts a divide-by-2 into the PLL output and feedback path. Logic HIGH inserts a divide-by-1 into the PLL output and feedback path. LVCMOS/LVTTL interface levels.
14, 16, 21, 23, 28	Q0, Q1, Q2, Q3, Q4	Output		Single-ended clock outputs. LVCMOS/LVTTL interface levels.
18	PLL_EN	Input		PLL enable. Enable and disables the PLL. Logic HIGH enables the PLL. Logic LOW disables the PLL and the input reference signal is routed to the output dividers (PLL bypass). LVCMOS/LVTTL interface levels.
19	LOCK	Output		PLL lock indication output. Logic HIGH indicates PLL lock. Logic LOW indicates PLL is not locked. LVCMOS/LVTTL interface levels.
25	Q/2	Output		Single-ended clock output. LVCMOS/LVTTL interface levels.
26	2XQ	Output		Single-ended clock output. LVCMOS/LVTTL interface levels.

NOTE: *Pulldown* refers to internal input resistors. See Table 2, *Pin Characteristics*, for typical values.

Table 2. Pin Characteristics

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C _{IN}	Input Capacitance			4		pF
C _{PD}	Power Dissipation Capacitance (total)	V _{DD} = AV _{DD} = 3.6V		330		pF
R _{PULLDOWN}	Input Pulldown Resistor	nPE		56		kΩ
R _{OUT}	Output Impedance			11		Ω

Device Configuration

The 870919I-01 requires a connection of one of the clock outputs to the FEEDBACK input to close the PLL feedback path. The selection of the output (output divider) for PLL feedback will impact the device

configuration and input to output frequency ratio and frequency ranges. See [Table 3G](#) for details.

Function Tables

Table 3A. OE/nRST Mode Configuration Table

Input	
OE/nRST	Operation
0	Device is reset and the outputs Q0:Q4, nQ5, 2XQ, Q/2 are in high-impedance state. This control is asynchronous.
1	Outputs are enabled.

Table 3B. REF_SEL Mode Configuration Table

Input	
REF_SEL	Operation
0	SYNC0 is the selected PLL reference clock.
1	SYNC1 is the selected PLL reference clock.

Table 3C. nPE Mode Configuration Table

Input	
nPE	Operation
0	The rising edge of the 2XQ, Q0:Q4 and Q/2 outputs and the falling edge of the nQ5 output are synchronized.
1	The falling edge of the 2XQ, Q0:Q4 and Q/2 outputs and the rising edge of the nQ5 output are synchronized.

Table 3D. FREQ_SEL Mode Configuration Table

Input	
FREQ_SEL	Operation
0	The VCO output is frequency-divided by 2. This setting allows for a lower input frequency range. See also table 3G for available frequency ranges.
1	The VCO output is frequency-divided by 1. This setting allows for a higher input frequency range. See also table 3G for available frequency ranges.

Table 3E. PLL_EN Mode Configuration Table

Input	
PLL_EN	Operation
0	The PLL is bypassed. The selected input reference clock is routed to the output dividers for low-frequency board test purpose. The PLL-related AC specifications do not apply in PLL bypass mode.
1	The PLL is enabled and locks to the selected input reference signal.

Table 3F. LOCK Mode Configuration Table

Output	
LOCK	Operation
0	PLL is not locked to the selected input reference clock.
1	PLL is locked to the selected input reference clock.

Table 3G. Frequency Configuration Table

Outputs Used for PLL Feedback	FREQ_SEL	Input Frequency Range (MHz)	Output Frequency Range (MHz) and Output-to-Input Frequency Multiplication Factor		
		SYNC[0:1]	Q[0:4], nQ5 ^{NOTE1}	2XQ	Q/2
Q0, Q1, Q2, Q3, Q4 or nQ5	0	5 - 40	5 - 40 (1x)	10 - 80 (2x)	2.5 - 20 (0.5x)
	1	10 - 80	10 - 80 (1x)	20 - 160 (2x)	5 - 40 (0.5x)
2XQ	0	10 - 80	5 - 40 (0.5x)	10 - 80 (1x)	2.5 - 20 (0.25x)
	1	20 - 100 ^{NOTE2}	10 - 50 (0.5x)	20 - 100 (1x)	5 - 25 (0.25x)
Q/2	0	2.5 - 20	5 - 40 (2x)	10 - 80 (4x)	2.5 - 20 (1x)
	1	5 - 40	10 - 80 (2x)	20 - 160 (4x)	5 - 40 (1x)

NOTE 1: The nQ5 output is inverted (180° phase shift) with respect to Q0:Q4.

NOTE 2: The input reference frequency is limited to 100MHz maximum.

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, $V_{DD(ABS\ MAX)}$	4.6V
Inputs, V_I	-0.5V to $V_{DD(ABS\ MAX)} + 0.5V$
Outputs, V_O	-0.5V to $V_{DD(ABS\ MAX)} + 0.5V$
Package Thermal Impedance, θ_{JA} 28 Lead QSOP 28 Lead PLCC	66.0°C/W (0 lfpm) 46.4°C/W (0 lfpm)
Storage Temperature, T_{STG}	-65°C to 150°C

DC Electrical Characteristics

Table 4A. Power Supply DC Characteristics, $V_{DD} = AV_{DD} = 3.3V \pm 0.3V$, $T_A = -40^\circ C$ to $85^\circ C$

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{DD} , AV_{DD}	Positive Supply Voltage		3.0	3.3	3.6	V

t_{LOCK}	PLL Lock Time				10	ms

NOTE: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 1: Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at $V_{DD}/2$.

NOTE 2: This parameter is defined in accordance with JEDEC Standard 65.

NOTE 3: Measured between coincident rising output edges of Q0:Q4, 2XQ, Q/2 and the falling edge of nQ5.

NOTE 4: Defined as the time difference between the input reference clock and the average feedback input signal when the PLL is locked and the input reference frequency is stable.

NOTE 5: These parameters are guaranteed by characterization. Not tested in production.

Recommendations for Unused Output Pins

Outputs:

LVC MOS Outputs

All unused LVC MOS output can be left floating. There should be no trace attached.

The schematic example focuses on functional connections and is not configuration specific. Refer to the pin description and functional tables in the datasheet to ensure that the logic control inputs are properly set.

Power Considerations

This section provides information on power dissipation and junction temperature for the 870919I-01. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the 870919I-01 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{DD} = 3.3V + 0.3V = 3.6V$, which gives worst case results.

- Power (core)_{MAX} = $V_{DD_MAX} * I_{DD_MAX} = 3.6V * 5mA = 18mW$
- Output Impedance R_{OUT} Power Dissipation due to Loading 50Ω to $V_{DD}/2$
Output Current $I_{OUT} = V_{DD_MAX} / [2 * (50\Omega + R_{OUT})] = 3.6V / [2 * (50\Omega + 11\Omega)] = 29.5mA$
- Power Dissipation on the R_{OUT} per LVCMOS output
Power (R_{OUT}) = $R_{OUT} * (I_{OUT})^2 = 11\Omega * (29.5mA)^2 = 9.57mW$ per output
- Total Power (R_{OUT}) = R_{OUT} (per output) * number of outputs = $9.57mW * 8$ outputs = **76.56mW**

Dynamic Power Dissipation for Q = 80MHz

$$\text{Power (80MHz)} = C_{PD} * \text{Frequency} * (V_{DD})^2 = 330pF * 80MHz * (3.6V)^2 = 342mW$$

Total Power

$$\begin{aligned} &= \text{Power (core)}_{MAX} + \text{Total Power (} R_{OUT} \text{)} + \text{Power (80MHz)} \\ &= 18mW + 76.56mW + 342mW \\ &= \mathbf{436.56mW} \end{aligned}$$

2. Junction Temperature.

Junction temperature, T_J , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for the devices is $125^\circ C$.

The equation for T_J is as follows: $T_J = \theta_{JA} * Pd_{total} + T_A$

T_J = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_{total} = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is $66^\circ C/W$ per Table 6 below.

Therefore, T_J for an ambient temperature of $85^\circ C$ with all outputs switching is:

$$85^\circ C + 0.437W * 66^\circ C/W = 113.8^\circ C. \text{ This is below the limit of } 125^\circ C.$$

This calculation is only an example. T_J will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

Table 6. Thermal Resistance θ_{JA} for a 28 Lead QSOP, Forced Convection

θ_{JA} by Velocity			
Linear Feet per Minute	0	200	500
Multi-Layer PCB, JEDEC Standard Test Boards	$66.0^\circ C/W$	$58.3^\circ C/W$	$55.2^\circ C/W$
