

SINGLE CHIP PC AUDIO SYSTEM CODEC+SPEAKER AMPLIFIER+CAPLESS HP+LDO

92HD91

Description

The 92HD91 single-chip audio system is a low power optimized, high fidelity, 4-channel audio codec with integrated speaker amplifier, capless headphone amplifier, and low drop out voltage regulator.

The high integration of the 92HD91 enables the smallest PCB footprint with the lowest system BOM count and cost. 92HD91 provides high quality HD Audio capability to notebook and business desktop PC applications.

Features

- **4 Channels (2 stereo DACs and 2 stereo ADCs) with 24-bit resolution**
 - Supports full-duplex stereo audio and simultaneous VoIP
 - Provides a mono output
 - 2.1 audio crossover support
- **2W/channel Class-D stereo BTL speaker amplifier @ 4 ohms and 5V**
 - 10 band hardware parametric equalizer
 - Hardware compressor limiter
- **Capless headphone amplifier with charge pump/LDO**
- **Combo Jack Support allowing for dual-function headphone and headset detection**
- **Speaker Protection**
 - Dedicated BTL high pass filter
 - Mono bandpass filter
- **Full HDA015-B low power support**
- **Internal digital core LDO voltage regulator**
- **Microsoft WLP desktop premium logo compliant**
- **Dual SPDIF for WLP compliant support of simultaneous HDMI and SPDIF output**
- **Support for 1.5V and 3.3V HDA signaling**
- **Two digital microphone inputs (mono, stereo, or quad microphones)**
- **Microphone Mute Input (on WB revisions and beyond)**
- **High performance analog mixer**
- **2 adjustable VREF Out pins for analog microphone bias**
- **6 analog ports with port presence detect (5 single ended, 1 BTL)**
- **Analog and digital PC Beep support**
- **AUX Audio Mode for playback and record**
- **48-pad QFN RoHS packages in Commercial and Industrial Temperature Ranges**

Full HDA015-B low power support

- Audio inactivity transitions codec from D0 to D3 low power mode
- Resume from D3 to D0 with audio activity in < 10 msec
- D3 to D0 transition with < -65dB pop/click
- Port presence detect in D3 with or without bit clock
- PC beep wake up in D3
- Additional vendor specific modes for even lower power

Software Support

- Intuitive TSI HD Sound graphical user interface that allows configurability and preference settings
- 12 band fully parametric equalizer
 - Constant, system-level effects tuned to optimize a particular platform can be combined with user-mode “presets” tailored for specific acoustical environments and applications
 - System-level effects automatically disabled when external audio connections made
- Dynamics Processing
 - Enables improved voice articulation
 - Compressor/limiter allows higher average volume level without resonances or damage to speakers.
- TSI Vista APO wrapper
 - Enables multiple APOs to be used with the TSI Driver
- Microphone Beam Forming, Acoustic Echo Cancellation, and Noise Suppression
- Dynamic Stream Switching
 - Improved multi-streaming user experience with less support calls
- Broad 3rd party branded software including Creative, Dolby, DTS, and SRS

TABLE OF CONTENTS

1. DESCRIPTION	11
1.1. Overview	11
1.2. Orderable Part Numbers	11
2. DETAILED DESCRIPTION	12

1. DESCRIPTION

1.1. Overview

The 92HD91 audio CODEC provides stereo 24-bit, full duplex resolution supporting sample rates up to 192kHz by the DAC and ADC. SPDIF outputs support sample rates of 192kHz, 96kHz, 88.2kHz, 48kHz, and 44.1kHz. Additional sample rates are supported by the driver software.

An integrated BTL stereo amplifier is ideal for driving 4ohm or 8ohm integrated speakers in mobile and ultra-mobile computers. For desktop computers or mobile computers using only one speaker, the BTL output stage may be configured to support a single mono speaker.

The 92HD91 audio CODEC supports a wide range of desktop and laptop configurations. The 2 independent SPDIF output interfaces provide connectivity to consumer electronic equipment or to a home entertainment system. Simultaneous HDMI and SPDIF output is possible. All inputs can be programmed with 0-30 dB gain in 10 dB steps allowing for line or microphone use of any input.

Port presence detect capabilities allow the CODEC to detect when audio devices are connected to the CODEC. The fully parametric Internal EQ can be initiated upon headphone jack insertion and removal for protection of notebook speakers.

The 92HD91 audio CODEC operates with a 3.3V digital supply and a 5V (4.75V allowed when using external voltage regulator) analog supply. It allows for 1.5V and 3.3V HDA signaling; the correct signalling level is selected dynamically based on the power supply voltage on the DVDD-IO pin.

The 92HD91 audio CODEC is offered in a 48-pin QFN Environmental (ROHS) package.

1.2. Orderable Part Numbers

92HD91B1X5NLGXyyX	Aux mode
92HD91B2X5NLGXyyX	No Aux mode
92HD91B1X5NLGIyyX	Aux mode Industrial Temp
92HD91B2X5NLGIyyX	No Aux mode Industrial Temp

yy = silicon stepping/revision, contact sales for current data.
Add an "8" to the end for tape and reel delivery.

Please note that Industrial Temp is only available on revision WC and forward.

2. DETAILED DESCRIPTION

2.1. Port Functionality

Multi-function (Input/Output) ports allow for the highest possible flexibility. 7 bi-directional ports, 2 are headphone capable, support a wide variety of consumer desktop and mobile system use models.

- Port A supports
 - Headphone Out
 - Line Out
 - Line Input
 - Mic with 0/10/20/30 dB Boost
- Port B supports
 - Capless Headphone Out
 - Capless Line Out
- Port C
 - Line In
 - Line Out
 - Mic with 0/10/20/30 dB Boost
- Port D supports
 - BTL stereo output
 - BTL (L+/L-) mono out
- Port E supports
 - Line In
 - Line Out
 - Mic with 0/10/20/30 dB Boost
- Port F supports
 - Line In
 - Line Out
 - Mic with 0/10/20/30 dB Boost
- Mono Out supports
 - Line Out

Pins 48-QFN	Port	Input	Output	Headphone	BTL	Mic Bias (Vref pin)	Input boost amp
28/29	A	Yes	Yes	Yes		Yes	Yes
31/32	B		Yes	Yes			
19/20	C	Yes	Yes			Yes	Yes
40/41/43/44	D		Yes		Yes		
15/16	E	Yes	Yes				Yes
17/18	F	Yes	Yes				Yes
25	Mono Out		Yes				
48	SPDIF_OUT0		Yes				
46	DMIC1/SPDIFOUT1/	Yes	Yes				Yes
4 (CLK=2)	DMIC0	Yes					Yes

Table 1. Port Functionality

2.1.1. Port Characteristics

Universal (Bi-directional) jacks are supported on ports A, C, E, and F. Ports A and B are designed to drive 32 ohm (nominal) headphones or a 10K (nominal) load. Line Level outputs are intended to drive an external 10K load (nominal) and an on board shunt resistor of 20-47K (nominal). However, applications may support load impedances of 5K ohms and above. Input ports are 50K (nominal) at the pin.

DAC full scale outputs and intended full scale input levels are 1V rms at 5V. Line output ports and Headphone output ports on the 92HD93 codec may be configured for +3dBV full scale output levels by using a vendor specific verb.

Output ports are always on to prevent pops/clicks associated with charging and discharging output coupling capacitors. This maintains proper bias on output coupling caps even in power state D3 as long as AVDD is available. Unused ports should be left unconnected. When updating existing designs to use the 92HD93 codec, ensure that there are no conflicts between the output ports on the 92HD93 codec and existing circuitry.

AFG Power State	Input Enable	Output Enable	Used as output for DAC/Mixer	Used as output for analog PC_Beep	Used as input for ADC, mixer	Port Behavior
D0-D2	1	1	Don't care	Don't care	Yes	Not allowed. Port is active as input.
					No	Not allowed. Inactive (Power Down) - Port keeps output coupling caps charged if port uses caps.
	1	0	NA	NA	Yes	Active - Port enabled as input
	1	0	NA	NA	No	Inactive (Power Down) - Port keeps output coupling caps charged if port uses caps.
	0	1	currently used by DAC, mixer, beep, or is traditional line or headphone output	NA	NA	Active - Port enabled as output
	0	1	not currently used by DAC, mixer, beep and is capless HP/BTL port			Inactive (Power Down)
	0	0	NA	NA	NA	Inactive (Power Down) - Port keeps output coupling caps charged if port uses caps.
D3	1	1	NA	NA	Don't care	Not allowed. Inactive (Power Down) - Port keeps output coupling caps charged if port uses caps.
	1	0	NA	NA	Don't care	Inactive (Power Down) - Port keeps output coupling caps charged if port uses caps.
	0	1	currently used by DAC, mixer, beep, or is traditional line or headphone output	Don't care	Don't care	Low power state. If enabled, Beep will output from the port
	0	1	not currently used by DAC, mixer, beep and is capless HP/BTL port			Inactive (Power Down)
	0	0	NA	NA	Don't care	Inactive (Power Down) - Port keeps output coupling caps charged if port uses caps.
D3cold	-	-				Inactive (lower power) - Port keeps output coupling caps charged if port uses caps.

Table 2. Analog Output Port Behavior

92HD91

SINGLE CHIP PC AUDIO SYSTEM, CODEC+SPEAKER AMPLIFIER+CAPLESS HP+LDO

AFG Power State	Input Enable	Output Enable	Used as output for DAC/Mixer	Used as output for analog PC_Beep	Used as input for ADC, mixer	Port Behavior
D4	-	-				Inactive (lower power) - Port keeps output coupling caps charged if port uses caps.
D5	-	-				Off - Charge on coupling caps (if used) will not be maintained.

Table 2. Analog Output Port Behavior

2.1.2. *Vref_Out*

Ports C, & A support Vref_Out pins for biasing electret cartridge microphones. Settings of 80% AVDD, 50% AVDD, GND, and Hi-Z are supported. Attempting to program a pin widget control with a reserved or unsupported value will cause the associated Vref_Out pin to assume a Hi-Z state and the pin widget control Vref_En field will return a value of '000' (Hi-Z) when read.

2.1.3. *Jack Detect*

Plugs inserted to a jack on Ports A, B, C & SPDIFOUT0 are detected using SENSE_A. Plugs inserted to a jack on Ports E, F, DMIC0, & SPDIFOUT1 are detected using SENSE_B. Per HDA015-B, the detection circuit operates when the CODEC is in D0 - D3 and can also operate if both the CODEC and Controller are in D3 (no bus clock.) Jack detection requires that all supplies (analog and digital) are active and stable. When AVDD is not present, the value reported in the pin widget is invalid.

When the HD Audio bus is in a low power state (reset asserted and clock stopped) the CODEC will generate a Power State Change Request when a change in port connectivity is sensed and then generate an unsolicited response after the HD Audio link has been brought out of a low power state and the device has been enumerated. Per HDA015-B, this will take less than 10mS.

The following table summarizes the proper resistor tolerances for different analog supply voltages..

AVdd Nominal Voltage (+/- 5%)	Resistor Tolerance Pull-Up	Resistor Tolerance SENSE_A/B
4.75V	1%	1%

Resistor	SENSE_A	SENSE_B
39.2K	PORT A (HP0)	PORT E
20.0K	PORT B (HP1)	PORT F
10.0K	PORT C	DMIC0
5.11K	SPDIFOUT0	SPDIFOUT1 (DMIC1)
2.49K	Pull-up to AVDD	Pull-up to AVDD

Table 3. 48pin Jack Detect

See reference design for more information on Jack Detect implementation.

2.1.4. *SPDIF Output*

Both SPDIF Outputs can operate at 44.1kHz, 48kHz, 88.2kHz, 96kHz and 192KHz as defined in the Intel High Definition Audio Specification with resolutions up to 24 bits. This insures compatibility with all consumer audio gear and allows for convenient integration into home theater systems and media center PCs.

The two SPDIF output converters can not be aligned in phase with the DACs. Even when attached to the same stream, the two SPDIF output converters may be misaligned with respect to their frame boundaries.

Per the HDA015-B, the SPDIF outputs support the ability to provide clocking information even when no stream is selected for the converter, or when in a low power state. Also, the SPDIF output ports support port presence detect.

SPDIF Outputs are outlined in tables below.

AFG Power State	RESET#	Output Enable	Converter Dig Enable	Stream ID	Keep Alive Enable	Pin Behavior
D0-D3	Asserted (Low)	-	-	-	-	Hi-Z (internal pull-down enabled) immediately after power on, otherwise the previous state is retained.
D0	De-Asserted (High)	Disabled	-	-	-	Hi-Z (internal pull-down enabled)
	De-Asserted (High)	Enabled	Disabled	-	-	Active - Pin drives 0 (internal pull-down NA)
	De-Asserted (High)	Enabled	Enabled	0	-	Active - Pin drives SPDIF-format, but data is zeroes (internal pull-down NA)
	De-Asserted (High)	Enabled	Enabled	1-15	-	Active - Pin drives SPDIFOut0 data (internal pull-down NA)
D1-D2	De-Asserted (High)	Disabled	-	-	-	Hi-Z (internal pull-down enabled)
	De-Asserted (High)	Enabled	-	-	0	Active - Pin drives 0 (internal pull-down NA)
			Enabled	-	1	Active - Pin drives SPDIF-format, but data is zeroes (internal pull-down NA)
D3	De-Asserted (High)	-	-	-	0	Hi-Z (internal pull-down enabled)
		Disabled	-	-	1	Hi-Z (internal pull-down enabled)
		Enabled	Enabled	-	1	Active - Pin drives SPDIF-format, but data is zeroes (internal pull-down NA)
D3cold	-	-	-	-	-	Hi-Z (internal pull-down enabled)
D4	-	-	-	-	-	Hi-Z (port off)
D5	-	-	-	-	-	Hi-Z (port off)

Table 4. SPDIF OUT 0 Behavior

AFG Power State	RESET#	GPIO0 Enable	Input Enable	Output Enable	Converter Dig En	Stream ID	Keep Alive En	Pin Behavior
D0-D3	Asserted (Low)	-	-	-	-	-	-	Hi-Z (internal pull-down enabled) immediately after power on, otherwise the previous state is retained.
D0-D3	De-Asserted (High)	Enabled	-	-	-	-	-	Active - Pin reflects GPIO0 configuration (internal pull-down enabled)
D0-D3	De-Asserted (High)	Disabled	Enabled	Disabled	-	-	-	Pin functions as digital mic input (internal pull-down enabled)

Table 5. SPDIF OUT 1 Behavior

AFG Power State	RESET#	GPIO0 Enable	Input Enable	Output Enable	Converter Dig En	Stream ID	Keep Alive En	Pin Behavior
D0	De-Asserted (High)	Disabled	Disabled	Disabled	-	-	-	Hi-Z (internal pull-down enabled)
			-	Enabled	Disabled	-	-	Active - Pin drives 0 (internal pull-down NA)
					Enabled	0	-	Active - Pin drives SPDIF-format, but data is zeroes (internal pull-down NA)
						1-15	-	Active - Pin drives SPDIFOut1 data (internal pull-down NA)
D1-D2	De-Asserted (High)	Disabled	Disabled	Disabled	-	-	-	Hi-Z (internal pull-down enabled)
				Enabled	Disabled	-	-	Active - Pin drives 0 (internal pull-down NA)
					Enabled	-	0	Active - Pin drives 0 (internal pull-down NA)
						-	1	Active - Pin drives SPDIF-format, but data is zeroes (internal pull-down NA)
D3	De-Asserted (High)	Disabled	Disabled	Disabled	-	-	-	Hi-Z (internal pull-down enabled)
				Enabled	Disabled	-	-	Hi-Z (internal pull-down enabled)
					Enabled	-	0	Hi-Z (internal pull-down enabled)
						-	1	Active - Pin drives SPDIF-format, but data is zeroes (internal pull-down NA)
D3cold	-	Disabled	Disabled	-	-	-	-	Hi-Z (internal pull-down enabled)
D4	-	-	-	-	-	-	-	Hi-Z (port off)
D5	-	-	-	-	-	-	-	Hi-Z (port off)

Table 5. SPDIF OUT 1 Behavior

2.2. Mono Output

The Mono Out port source selection, power state, and mute characteristics are all independently controlled by the mono output port controls. EQ does not apply to this path. An internal 2nd order band-pass filter is provided to restrict the output frequencies when using mono out to drive an external amplified sub-woofer.

The following sources are available for the Mono Out pin:

- DAC0 Output: When selected (by using the port connection list), the DAC0 left and right outputs are summed together.
- DAC1 Output: When selected (by using the port connection list), the DAC1 left and right outputs are summed together.
- Mixer Output: When selected (by using the port connection list), the mixer left and right outputs are summed together.

The stereo inputs are scaled by -6dB and then summed to provide an output that is the average of the two inputs. The full scale output at mono out is designed to be about 0dBV. It is not possible to adjust to a +3dBV output level.

2.3. Mono output Band-Pass Filter

For many applications, the primary speakers are incapable of reproducing low frequency audio. Therefore it is desirable to implement a woofer or sub-woofer speaker. The mono output is ideal for this task.

However, the frequency response should be restricted to prevent interference with the primary speakers. Typically an external filter, known as a cross-over filter, is used. The mono processing path includes a band-pass filter with programmable high and low cut-off frequencies to eliminate the need for an external filter.

2.3.1. Filter Description

The band-pass filter is derived from the common biquadratic filter and provides a 12dB/octave roll-off. The filter may be programmed for a -3dB lower band edge of: 63Hz, 80Hz, 100Hz, 120Hz, 150Hz, 200Hz, 315Hz, or 400Hz. The filter may be programmed for a -3dB upper band edge of: 150Hz, 200Hz, 250Hz, 315Hz, 400Hz, 500Hz, 630Hz, or 800Hz.

The band-pass filter is enabled by default with a cut-off frequencies at 120Hz and 250Hz. The filter may be bypassed using the associated verb (processing state verb).

The Analog PC_Beep input is not affected by the band-pass filter.

2.4. Mixer

The mixer supports independent gain (-34.5 to +12dB in 1.5dB steps) on each input as well as independent mutes on each input. The following inputs are available:

- Port A
- Port C
- Port E
- Port F
- DAC 0
- DAC 1

2.5. ADC Multiplexers

The codec implements 2 ADC input multiplexers. These multiplexers incorporate the ADC record gain function :(-16 to +30dB gain in 1dB steps) as an output amp and allow a preselection of one of below possible inputs:

- Port A
- Port C
- Port E
- Port F
- Mixer Output
- DMIC 0
- DMIC 1

2.6. Power Management

The HD Audio specification defines power states, power state widgets, and power state verbs. Power management is implemented at several levels. The Audio Function Group (AFG), all converter widgets, and all pin complexes support the power state verb F05/705. Converter widgets are active in D0 and inactive in D1-D3.

The following table describes what functionality is active in each power state.

Function	D0	D1 ¹	D2	D3	D3cold	Vendor Specific D4	Vendor Specific D5
SPDIF Outputs	On	On	On (idle)	On (idle) ⁵	Off	Off	Off
Digital Microphone inputs	On	Off	Off	Off	Off	Off	Off
DAC	On	Off	Off	Off	Off	Off	Off
D2S	On	Off	Off	Off	Off	Off	Off
ADC	On	Off	Off	Off	Off	Off	Off
ADC Volume Control	On	Off	Off	Off	Off	Off	Off
Ref ADC	On	Off	Off	Off	Off	Off	Off
Analog Clocks	On	Off	Off	Off	Off	Off	Off
GPIO pins	On	On	On	On ⁵	On	On	Off
VrefOut Pins	On	On	Off	Off	Off	Off	Off
Input Boost	On	On	Off	Off	Off	Off	Off
Analog mixer	On	On	Off	Off	Off	Off	Off
Mixer Volumes	On	On	Off	Off	Off	Off	Off
Analog PC_Beep	On	On	On	On	Off	Off	Off
Digital PC_Beep	On	On	On	On ⁵	Off	Off	Off
Lo/HP Amps	On	On	On	Low Drive ²	Low Drive ²	Low Drive ²	Off
Cap-less HP Amps	On	On	On	Low Drive ²	Low Drive ²	Low Drive ²	Off
BTL Amp	On	On	On	Low Drive ²	Off	Off	Off
VAG amp	On	On	On	Low Drive ³	Low Drive	Low Drive	Off
Port Sense	On	On	On	On ⁴	Off	Off	Off
Reference Bias generator	On	On	On	On	On	On	Off
Reference Bandgap core	On	On	On	On	On	On	Off
HD Audio-Link	On	On	On	On ⁵	Limited	Off	Off

Table 6. Power Management

1. No DAC or ADC streams are active. Analog mixing and loop thru are supported.
2. VAG is kept active when ports are disabled or in D3/D3cold/D4. PC_Beep is supported in D3 but may be attenuated and distorted depending on load impedance. The codec will shut down the capless headphone amplifiers and BTL amplifier in D3 and below. In D3, Hendrix/Kaveri will turn on the BTL and Capless amplifiers if activity is detected on the PC_BEEP input and analog PC_Beep is enabled.
3. VAG is always ramped up and down gradually, except in the case of a sudden power removal. VAG is active in D2/D3 but in a low power state.
4. Both AVDD and DVDD must be available for Port Sense to operate.
5. Not active if BITCLK is not running (Controller in D3), but can signal power state change request (PME)

The D3-default state is available for HD Audio compliance. The programmable values, exposed via vendor-specific settings, are under TSI Device Driver control for further power reduction. The analog mixer, line and headphone amps, port presence detect, and internal references may be disabled using vendor specific verbs. Use of these vendor specific verbs will cause pops.

The default power state for the Audio Function Group after reset is D3.

2.7. AFG D0

The AFG D0 state is the active state for the device. All functions are active if their power state (if they support power management at their node level) has been set to D0.

2.8. AFG D1

D1 is a lower power mode where all converter widgets are disabled. Analog mixer and port functions are active. The part will resume from the D1 to the D0 state within 1 mS.

2.9. AFG D2

The D2 state further reduces power by disabling the mixer and port functions. The port amplifiers and internal references remain active to keep port coupling caps charged and the system ready for a quick resume to either the D1 or D0 state. The part will resume from the D2 state to the D0 state within 2mS.

2.10. AFG D3

The D3-default state is available for HD Audio compliance. All converters are shut down. Port amplifiers and references are active but in a low power state to prevent pops. Resume times may be longer than those from D2, but still less than 10mS to meet Intel low power goals. The default power state for the Audio Function Group after power is applied is D3.

While in AFG D3, the HD Audio controller may be in a D0 state (HD Audio bus active) or in a D3 state (HD Audio bus held in reset with no Bit_Clk, SData_Out, or Sync activity.) The expected behavior is as follows (see the HDA015-B section for more information):

Function	HDA Bus active	HDA Bus stopped
Port Presence Detect state change	Unsolicited Response	Wake Event followed by an unsolicited response
GPIO state change	Unsolicited Response	Wake Event followed by an unsolicited response

2.10.1. AFG D3cold

The D3cold power state is the lowest power state available that does not use vendor specific verbs. While in D3cold, the CODEC will still respond to bus requests to revert to a higher power state (double AFG reset, link reset). However, audio processing, port presence detect, and other functions are disabled. Per the HD Audio bus HDA015-B, the D3cold state is intended to be used just prior to removing power to the CODEC. Typically, power will be removed within 200mS. However, the codec may exit from the D3cold state by generating 2, back-to-back, AFG reset events. Resume time from D3cold is less than 200mS.

2.11. Vendor Specific Function Group Power States D4/D5

The codec introduces vendor specific power states. A vendor defined verb is added to the Audio Function Group that combines multiple vendor specific power control bits into logical power states for use by the audio driver. The 2 states defined offer lower power than the 5 existing states defined in the HD Audio specification and HDA015-B. The Vendor Specific D4 state provides lower digital power consumption relative to D3cold by disabling HD Audio link responses. Vendor specific D5 fur-

ther reduces power consumption on the digital supply by turning off GPIO drivers, and reduces analog power consumption by turning off all analog circuitry except for reset circuits.

States D4/D5 are not entered until D3cold has been requested so are actually D3cold options rather than true, independent, power states. Software can pre-program the D4 or D5 state as a re-definition of how the part will behave when the D3cold power state is requested or software may enter D3cold, then set the D4 or D5 before performing the power state get command. The preferred method is to request D3cold, then select D4 or D5 as desired. This will reduce the severity of pops encountered when entering D4 or D5.

Both power states require a link reset or removal of DVDD to exit.

The CODEC may pop when using these verbs and transition times to an active state (D1 or D0 for example) may take several seconds.

2.12. Low-voltage HDA Signaling

The codec is compatible with either 1.5V or 3.3V HDA bus signaling; in the 48QFN package the voltage selection is done dynamically based on the input voltage of DVDD_IO.

DVDD_IO is currently not a logic configuration pin, but rather provides the digital power supply to be used for the HDA bus signals.

When in 1.5V mode, the codec can correctly decode BITCLK, SYNC, RESET# and SDO as they operate at 1.5V; additionally it will drive SDI and SDO at 1.5V. None of the GPIOs are affected, as they always function at their nominal voltage (DVDD or AVDD).

2.13. Multi-channel capture

The capability to assign multiple “ADC Converters” to the same stream is supported to meet the microphone array requirements of Vista and future operating systems. Single converter streams are still supported this is done by assigning unique non zero Stream IDs to each converter. All capture devices (ADCs 0 and 1) may be used to create a multi-channel input stream. There are no restrictions regarding digital microphones.

The ADC Converters can be associated with a single stream as long the sample rate and the bits per sample are the same. The assignment of converter to channel is done using the “CnvtrID” widget and is restricted to even values. The ADC converters will always put out a stereo sample and therefore require 2 channels per converter.

The stream will not be generated unless all entries for the targeted converters are set identically, and the total number of assigned converter channels matches the value in the NmbrChan field. These are listed the “Multi-Converter Stream Critical Entries.” table.

An example of a 4 Channel Stream with ADC0 supplying channels 0&1 and ADC1 supplying channels 2 & 3 is shown below. A 4 Channel stream can be created by assigning the same non-zero stream id “Strm= N” to both ADC0 and ADC1. The sample rates must be set the same and the number of channels must be set to 4 channels “NmbrChan = 0011”.

ADC1 CnvtrID	(NID = 0x08)	
	[3:0]	Ch = 2
ADC0 CnvtrID	(NID = 0x07)	
	[3:0]	Ch=0

Table 7. Example channel mapping

Figure 1. Multi-channel capture

ADC0.CnvtrID.Channel = 0	Stream ID	Data Length	ADC0 Left Channel	ADC0 Right Channel	ADC1 Left Channel	ADC1 Right Channel
ADC1.CnvtrID.Channel = 2						
ADC0.CnvtrID.Channel = 2	Stream ID	Data Length	ADC1 Left Channel	ADC1 Right Channel	ADC0 Left Channel	ADC0 Right Channel
ADC1.CnvtrID.Channel = 0						

The following figure describes the bus waveform for a 24-bit, 48KHz capture stream with ID set to 1.

Figure 2. Multi-channel timing diagram

ADC[1:0] Cnvtr	Bit Number	Sub Field Name	Description
	[15]	StrmType	Stream Type (TYPE): 0: PCM 1: Non-PCM (not supported)
	[14]	FrmtSmplRate	Sample Base Rate 0= 48kHz 1=44.1KHz
	[13:11]	SmplRateMultp	Sample Base Rate Multiple 000=48kHz/44.1kHz or less 001= x2 010= x3 (not supported) 011= x4 192kHz only, 176.4 not supported 100-111= Reserved

Table 8: Mult-channel

	[10:8]	SmplRateDiv	Sample Base Rate Divisor 000= Divide by 1 001= Divide by 2 (not supported) 010= Divide by 3 (not supported) 011= Divide by 4 (not supported) 100= Divide by 5 (not supported) 101= Divide by 6 (not supported) 110= Divide by 7 (not supported) 111= Divide by 8 (not supported)
	[6:4]	BitsPerSmpl	Bits per Sample 000= 8 bits (not supported) 001= 16 bits 010= 20 bits 011= 24 bits 100-111= Reserved
	[3:0]	NmbrChan	Number of Channels Number of channels for this stream in each “sample block” of the “packets” in each “frame” on the link. 0000=1 channel (not supported) 0001 = 2 channels ... 1111= 16 channels.
	[7:4]	Strm	Software-programmable integer representing link stream ID used by the converter widget. By convention stream 0 is reserved as unused.
	[3:0]	Ch	Integer representing lowest channel used by converter. 0 and 2 are valid Entries If assigned to the same stream, one ADC must be assigned a value of 0 and the other ADC assigned a value of 2.

Table 8: Mult-channel

2.14. EAPD

The EAPD pin (pin 47) is a dedicated, bi-directional control pin. Although named External Amplifier Power Down (EAPD) by the HD Audio specification, this pin operates as an external amplifier power up signal. The EAPD value is reflected on the EAPD pin; a 1 causes the external amplifier to power up (equivalent to D0), and a 0 causes it to power down (equivalent to D3.) When the EAPD value = 1, the EAPD pin must be placed in a state appropriate to the current power state of the associated Pin Widget even though the EAPD value (in the register) may remain 1. The default state of this pin is 0 (driving low.) The pin defaults to an open-drain configuration (an external pull-up is recommended.)

Per the HD Audio specification and HDA015-B, multiple ports may control EAPD. The EAPD pin assumes the highest power state of all the the EAPD bits in all of the pin complexes. The default value of EAPD is 1 (powered on), but the FG power state will override and the pin will be low. A port will request External Amp Power Up when its power state is active (FG and pin widget power state is D1 or D0) or (Analog PC_Beep is enabled and port is enabled as an output) and the port's EAPD bit is set to 1. The state of the EAPD pin (unless configured as an input or held low by an external circuit when configured as an open drain output) will be the logical OR of the external amp power up requests from all ports.

By default, the EAPD pin also functions as the Mute#/ShutDown# input for the internal BTL amplifier. In this mode, a low value at the pin (either due to internal EAPD being 0, or to an external entity forcing the pin low) will cause the internal BTL amplifier to mute or enter a low power state depending on the amplifier configuration. (See below)

Vendor specific verbs are available to configure this pin. These verbs retain their values across link and single function group resets but are set to their default values by a power on reset:

MODE1	MODE0	EAPD Pin Function	Description
0	0	Open Drain I/O	Value at pin is wired-AND of EAPD bit and external signal.(default)
0	1	CMOS Output	Value of EAPD bit in pin widget is forced at pin
1	0	CMOS Input	External signal controls internal amps. EAPD bit in pin widget ignored
1	1	CMOS Input	External signal controls internal amps. EAPD bit in pin widget ignored

Table 9. EAPD Pin Mode Select

Control Flag	Description
EAPD PIN MODE 1:0	Defines if EAPD pin is used as input, output, or bi-directional port (Open Drain)
BTL/HP SD	0 = Amp controlled by EAPD pin only (default) / 1 = Amp controlled by power state (pin and FG) only
BTL/HP SD MODE	0 = Amp will mute when disabled. / 1 = Amp will shut down (enter a low power state) when disabled (default for YA forward)
BTL/HP SD INV	0 = AMP will power down (or mute) when EAPD pin is low (default) / 1 = Amp will power down (or mute) when EAPD pin is high.

Table 10. Control bit descriptions for BTL amplifier and Headphone amplifier enable configurations

BTL SD	BTL SD MODE	BTL SD INV	EAPD Pin State	BTL Amp State
0	0	0	0	Amplifier is mute (default ¹)
0	0	0	1	Amplifier is active
0	0	1	0	Amplifier is active
0	0	1	1	Amplifier is mute
0	1	0	0	Amplifier is in a low power state
0	1	0	1	Amplifier is active
0	1	1	0	Amplifier is active
0	1	1	1	Amplifier is in a low power state
1	0	NA	NA	Amplifier follows pin/function group power state and will mute when disabled
1	1	NA	NA	Amplifier follows pin/function group power state and will enter a low power state when disabled

Table 11. BTL Amp Enable Configuration

1. EAPD bit is set to one by default but the EAPD state is 0 after power-on reset because the function group is not in D0. The state after a single or double function group reset will be compliant with HDA015-B.

SINGLE CHIP PC AUDIO SYSTEM, CODEC+SPEAKER AMPLIFIER+CAPLESS HP+LDO

HP SD	HP SD MODE	HP SD INV	EAPD Pin State	Headphone Amp State
0	0	0	0	Amplifier is mute (default ¹)
0	0	0	1	Amplifier is active
0	0	1	0	Amplifier is active
0	0	1	1	Amplifier is mute
0	1	0	0	Amplifier is in a low power state
0	1	0	1	Amplifier is active
0	1	1	0	Amplifier is active
0	1	1	1	Amplifier is in a low power state
1	0	NA	NA	Amplifier follows pin/function group power state and will mute when disabled
1	1	NA	NA	Amplifier follows pin/function group power state and will enter a low power state when disabled

Table 12. Headphone Amp Enable Configuration

1. EAPD bit is set to one by default but the EAPD state is 0 after power-on reset because the function group is not in D0. The state after a single or double function group reset will be compliant with HDA015-B.

Port E Headphone Amp Enable Configuration Bits	Normal Mode	Aux Mode
SD (EAPD Pin or power setting)	Not supported ¹	
SD INV	Not supported ¹	supported ²
SD MODE (power down or mute)	Not supported ¹	

Table 13. Port E Headphone Amp Enable Configuration support by part and mode

1. Port E not headphone capable on the 92HD94
2. Port E is typically connected to the dock headphone port. In Aux mode, EAPD will mute the record path on the 92HD94.

Analog BEEP enabled	EAPD Pin value ¹	Description
0	Forced to low when in D2 or D3	Follows description in HD Audio spec. External amplifier is shut down when pin or function group power state is D2 or D3 independent of value in EAPD bit.
1	Forced low in D2 or D3 unless port is enabled as output	Power state is ignored if port is enabled as output and port EAPD=1 to allow PC_BEEP support in D2 and D3

Table 14. EAPD Analog PC_BEEP behavior

1. When pin is enabled as Open Drain or CMOS output.

AFG Power State	RESET#	Analog PC_BEEP	Port Power State	Pin Behavior
D0-D3	Asserted (Low)	-	-	Active low immediately after power on, otherwise the previous state is retained across FG and link reset events
D0	De-Asserted (High)	-	-	Active - Pin reflects EAPD bit unless held low by external source.
D1	De-Asserted (High)	-	D0-D1	Active - Pin reflects EAPD bit unless held low by external source.
D2	De-Asserted (High)	Disabled	D0-D2	Pin forced low to disable external amp

Table 15. EAPD Behavior

AFG Power State	RESET#	Analog PC_BEEP	Port Power State	Pin Behavior
D2	De-Asserted (High)	Enabled	D0-D2	Active - EAPD Pin high if any port EAPD bit=1 and that port also enabled as output.
D3	De-Asserted (High)	Disabled	D0-D3	Pin forced low to disable external amp
D3	De-Asserted (High)	Enabled	D0-D3	Active - EAPD Pin high if any port EAPD bit=1 and that port also enabled as output.
D3cold	De-Asserted (High)	-	-	Pin forced low to disable external amp
D4	De-Asserted (High)	-	-	Pin forced low to disable external amp
D5	De-Asserted (High)	-	-	Pin Hi-Z (off)

Figure 4. EAPD implementation

2.15. Digital Microphone Support

The digital microphone interface permits connection of a digital microphone(s) to the CODEC via the DMIC0, DMIC1, and DMIC_CLK 3-pin interface. The DMIC0 and DMIC1 signals are inputs that carry individual channels of digital microphone data to the ADC. In the event that a single microphone is used, the data is ported to both ADC channels. This mode is selected using a vendor specific verb and the left time slot is copied to the ADC left and right inputs.

The DMIC_CLK output is controllable from 4.704Mhz, 3.528Mhz, 2.352Mhz, 1.176Mhz and is synchronous to the internal master clock. The default frequency is 2.352Mhz.

The two DMIC data inputs are reported as two stereo input pin widgets that incorporate a boost amplifier. The pin widgets are shown connected to the ADCs through the same multiplexors as the analog ports. Although the internal implementation is different between the analog ports and the digital microphones, the functionality is the same. In most cases, the default values for the DMIC clock rate and data sample phase will be appropriate and an audio driver will be able to configure and use the digital microphones exactly like an analog microphone.

To conserve power, the analog portion of the ADC will be turned off if the D-mic input is selected. When switching from the digital microphone to an analog input to the ADC, the analog portion of the ADC will be brought back to a full power state and allowed to stabilize before switching from the digital microphone to the analog input. This should take less than 10mS.

DMIC pin widgets support port presence detect directly using SENSE-B input.

The codec supports the following digital microphone configurations:

Digital Mics	Data Sample	ADC Conn.	Notes
0	N/A	N/A	No Digital Microphones
1	Single Edge	0, or 1	Available on either DMIC_0 or DMIC_1 When using a microphone that supports multiplexed operation (2-mics can share a common data line), configure the microphone for “Left” and select mono operation using the vendor specific verb. “Left” D-mic data is used for ADC left and right channels.
2	Double Edge on either DMIC_0 or 1	0, or 1	Available on either DMIC_0 or DMIC_1, External logic required to support sampling on a single Digital Mic pin channel on rising edge and second Digital Mic right channel on falling edge of DMIC_CLK for those digital microphones that don't support alternative clock edge (multiplexed output) capability.
3	Double Edge on one DMIC pin and Single Edge on the second DMIC pin.	0, or 1	Requires both DMIC_0 and DMIC_1, External logic required to support sampling on a single Digital Mic pin channel on rising edge and second Digital Mic right channel on falling edge of DMIC_CLK for those digital microphones that don't support alternative clock edge (multiplexed output) capability. Two ADC units are required to support this configuration
4	Double Edge	0, or 1	Connected to DMIC_0 and DMIC_1, External logic required to support sampling on a single Digital Mic pin channel on rising edge and second Digital Mic right channel on falling edge of DMIC_CLK for those digital microphones that don't support alternative clock edge capability. Two ADC units are required to support this configuration

Table 16. Valid Digital Mic Configurations

Power State	DMIC Widget Enabled?	DMIC_CLK Output	DMIC_0,1	Notes
D0	Yes	Clock Capable	Input Capable	DMIC_CLK Output is Enabled when either DMIC_0 or DMIC_1 Input Widget is Enabled. Otherwise, the DMIC_CLK remains Low
D1-D3	Yes	Clock Disabled	Input Disabled	DMIC_CLK is HIGH-Z with Weak Pull-down
D0-D3	No	Clock Disabled	Input Disabled	DMIC_CLK is HIGH-Z with Weak Pull-down
D4	-	Clock Disabled	Input Disabled	DMIC_CLK is HIGH-Z with Weak Pull-down
D5	-	Clock Disabled	Input Disabled	DMIC_CLK is HIGH-Z with Weak Pull-down

Table 17. DMIC_CLK and DMIC_0,1 Operation During Power States

Figure 5. Single Digital Microphone (data is ported to both left and right channels)

Figure 6. Stereo Digital Microphone Configuration

Note: Some Digital Microphone Implementations support data on either edge, therefore, the external mux may not be required.

Figure 7. Quad Digital Microphone Configuration

Note: Some Digital Microphone Implementations support data on either edge, in this case the external multiplexer is not required.

2.16. Analog PC-Beep

The codec supports automatic routing of the PC_Beep pin to Port A, Port B, and Port D outputs when the HD-Link is in reset.

When the link is active (not held in reset) Analog PC-Beep may be enabled manually. Analog PC_Beep is mixed at the port and only ports enabled as outputs will pass PC_Beep.

The Analog PC Beep input is sampled for 500us every 1ms. If the beep input is high or low (>200mVpp) for at least 37% of that time, it is considered active. If it is active for less than 7.5% of that time, it is possibly inactive. If no activity is detected for 64ms (128ms, 256ms and 512ms also selectable for the idle threshold), then beep is considered inactive.

Phase 1: analog beep auto-routing phase in the period after application of DVDD, before the first rising edge of link reset.

Phase 2: When not in phase 1

- Analog beep auto-detect will also be disabled.

- B. If analog beep function is enabled by driver.

Once analog PCbeep is detected(BEEP_PRESENCE=1), analog pc_beep will be enabled

If in D0-D2, enabled simply means muting or un-muting beep to avoid hearing system noise on the beep input pin but it is acceptable to turn off port amplifiers if not currently used by DACs, mixer, or beep to save power.

If in D3, enabled means that the necessary amplifiers are turned on so that the beep signal may be heard on all ports configured as outputs (see analog pc-beep description section above)

All needed amplifiers are enabled until BEEP_PRESENCE=0 for longer than the idle threshold

A flow chart of Analog PC Beep is below.

Figure 9. Analog PC Beep Flow chart

2.17. Digital PC-Beep

This block uses an 8-bit divider value to generate the PC beep from the 48kHz HD Audio Sync pulse. The digital PC_Beep block generates the beep tone on all Pin Complexes that are currently configured as outputs. The HD Audio spec states that the beep tone frequency = (48kHz HD Audio

SYNC rate) / (4*Divider), producing tones from 47 Hz to 12 kHz (logarithmic scale). Other audio sources are disabled when digital PC_Beep is active.

It should be noted that digital PC Beep is disabled if the divider = 00h.

PC-Beep may be attenuated and distorted when the CODEC is in D3 depending on the load impedance seen by the output amplifier since all ports are in a low power state while in D3. Load impedances of 10K or larger can support full scale outputs but lower impedance loads will distort unless the output amplitude is reduced. Digital PC_Beep requires a clock to operate and the CODEC will prevent the system from stopping the bus clock while in D3 by setting the Clock_Stop_OK bit to 0 to indicate that the part requires a clock.

2.18. Headphone Drivers

The codec implements both traditional and cap-less headphone outputs. The Microsoft Windows Logo Program allows up to the equivalent of 100ohms in series. However, an output level of +3dBV at the pin is required to support 300mV at the jack with a 32ohm load and 1V with a 320 ohm load. Microsoft allows device and system manufactures to limit output voltages to address EU safety requirements. (WLP 3.09 - please refer to the latest Windows Logo Program requirements from Microsoft.) The codec does not support power limiting.

Headphone performance will degrade if more than one port is driving a 32 ohm load.

2.19. BTL Amplifier

An integrated class-D stereo BTL amplifier is provided to directly drive 4 ohm speakers (2W @ 4.75V) or 8 ohm speakers (1W @ 4.75V). No external filter is needed for cable runs of 18" or less. An internal DC blocking filter prevents distortion when the audio source has DC content, and prevents unintentional power consumption when pausing audio playback. The amplifier may be controlled using the EAPD pin (see EAPD section.)

Using a vendor specific verb, the BTL amplifier may be configured to support a mono speaker connected to the L +/- pins. In this mode, the Left and Right audio is mixed and sent to the left output only. The right channel is turned off to conserve power.

Maximum gain for the BTL amplifier is programmable. The following 4 gain settings relative to a nominal line output are desired: +6.5dB, +9.5dB, +14.5dB, +16.5dB. Absolute gain may vary and the suggested accuracy is +/-1.5dB.

This gain is exposed in a vendor specific widget and is intended to mimic the pin programmable gain implemented in discrete BTL amplifiers commonly used in notebook computers.

The BTL amplifier includes thermal management circuitry. When the CODEC reaches a temperature of about 140 degrees, the output amplitude of the BTL amp is gradually lowered until the temperature falls below 140. All other functions will remain active if the BTL amplifier is shut down due to die temperature.

2.20. BTL Amplifier High-Pass Filter

For mobile applications, speakers are often incapable of reproducing low frequency audio and unable to handle the maximum output power of the BTL amplifier. A high-pass filter is implemented in the BTL output path to reduce the amount of low frequency energy reaching speakers attached to the BTL amplifier. This can prevent speaker failure.

2.20.1. Filter Description

The high-pass filter is derived from the common biquadratic filter and provides a 12dB/octave roll-off. The filter may be programmed for a -3dB response at: 100Hz, 200Hz, 300Hz, 400Hz, 500Hz, 750Hz, 1KHz, or 2KHz. The high pass filter is enabled by default with a cut-off frequency of 300Hz. The filter may be bypassed using the associated verb (processing state verb).

The analog PC_Beep input is not affected by the digital high-pass filter. To ensure that the speakers attached to the BTL amplifier are not harmed by low frequency audio entering the PC_Beep input, an external filter must be implemented. Fortunately, it is common practice to implement an attenuation circuit and DC blocking capacitor at the PC_Beep input. This attenuator/filter is easily adjusted to restrict low frequency audio. The easiest approach is to reduce the value of the DC blocking capacitor but other approaches are equally effective.

2.21. EQ

There are 5 bands of parametric EQ (bi-quad) per channel. Due to the flexibility of the bi-quad implementation, each filter band may be configured as a high-pass, low-pass, band-pass, high shelving, low shelving, or other function.

Each band has an independent set of coefficients. A bi-quad filter has 6 coefficients. One coefficient is normalized to 1 and 5 are programmed into the core. Each band supports up to +15dB boost or up to -36dB cut.

2.22. Combo Jack Detection

4 conductor (combo) jacks are becoming popular. In the most common implementation the 4 conductor plug has the same mechanical dimensions as a 3 conductor 3.5mm plug but the sleeve portion has been split into two segments: S1 and S2. When a 4-conductor plug (headset) is inserted into the jack T (Tip) = Left headphone audio, R (Ring) = Right headphone audio, S1 (First half of sleeve) = microphone input, and S2 (Second half of sleeve) = return (GND). When a 3-conductor plug (headphones) is inserted into the jack; T=Left audio, R=Right audio, S1=GND, S2=GND. By monitoring the S1 connection to see if it is shorted to ground, we can distinguish between headsets and headphones. Please note that analog microphone plugs (3-conductor-Lmic/Rmic/GND) and optical SPDIF plugs can not be supported using this implementation.

Figure 10. Combo Jack

Plug insertion is reported on the headphone port using the switch integrated into the jack.

The internal circuit monitors the voltage at the jack to determine if a low impedance load is present.

Detection of a microphone is not reported unless plug insertion is also detected.

2.23. GPIO

2.23.1. GPIO Pin mapping and shared functions

GPIO #	Pin	Supply	SPDIF In	SPDIF Out	GPIO	GPI	GPO	VrefOut	DMIC	VOL	Pull Up	Pull Down
0	46	DVDD		YES	YES				IN			50K
1	2	DVDD			YES				CLK			50K
2	4	DVDD			YES				IN			50K
3	48	DVDD		YES	YES							50K
4	24	AVDD			YES			YES				50K

2.23.2. SPDIF/Digital Microphone/GPIO Selection

3 functions are available on the DMIC_1/GPIO0/SPDIFOUT1 pin (pin 46). To determine which function is enabled, the order of precedence is followed:

1. If the GPIOs are enabled, they override both SPDIF_OUT and Digital Mics
2. If the GPIOs are not enabled through the AFG, then at reset, the pin is pulled low by an internal pull-down resistor.
3. If the port is enabled as an input, the digital microphones will be used.
4. If the port is enabled as an output, the SPDIF output will be used.
5. In the event that the port is enabled as an input and an output, the port will be an output and the Digital Mic path will be mute.

2.23.3. Digital Microphone/GPIO Selection

2 functions are available on the DMIC_CLK/GPIO1 (pin 2) and the DMIC_0/GPIO2 (pin 4) pins. To determine which function is enabled, the order of precedence is followed:

1. If GPIOs are not enabled through the AFG, then at reset, pins 2 and 4 are pulled low by an internal pull-down resistor.
2. If the GPIO 1 is enabled, the 2 DMIC pins become mute (unless programmed for GPIO or SPDIF use) and pin 2 becomes GPIO with an internal pull-down.
3. If GPIO2 is enabled through the AFG, pin 4 becomes a GPIO and is pulled low by an internal pull-down resistor.
4. If the port is enabled as an input, the digital microphones will be used.
5. If the port is not enabled as an input or if the pin is configured as a GPIO, the digital microphone path will be mute.

2.24. HD Audio HDA015-B support

The codec provides complete support for the HDA015-B specification (now DCN) building on the support already present in previous products. HDA015-B features supported are:

1. Persistence of many configuration options through bus and function group reset.
2. The ability to support port presence detect in D3 even when the HD Audio bus is in a low power state (no clock.)

3. Fast resume times from low power states: 1ms D1 to D0, 2ms D2 to D0, 10mS D3 to D0.
4. Notification if persistent register settings have been unexpectedly reset.
5. SPDIF active in D3 (required)

2.25. Digital Core Voltage Regulator

The digital core operates from a 1.8V (10%) supply voltage. Many systems require that the CODEC use a single 3.3V digital supply, so an integrated regulator is included on die. The regulator uses pin 9, DVDD, as its voltage source. The output of the LDO is connected to pin 1 and the digital core. A 10uF capacitor must be placed on pin 1 for proper load regulation and regulator stability.

The digital core voltage regulator is only dependent on DVDD. DVDDIO may be either 3.3 or 1.5V and may precede or follow DVDD in sequence. The CODEC digital logic and I/O (unless referenced to AVDD) will operate in the absence of AVDD. DVDD and AVDD supply sequencing for the application of power and the removal of power is neither defined nor guaranteed. It is common for desktop systems to supply AVDD from the system standby supply and the CODEC will tolerate, indefinitely, the condition where AVDD is active but DVDD and DVDDIO are inactive.

2.26. Aux Audio Support

The CODEC supports an auxiliary audio mode where audio routing is supported by default after power is supplied with the HD Audio bus disabled. In this mode, an I2S input is routed to one of several output ports depending on jack presence detection, likewise several audio sources (analog, digital mic, I2S) are routed and converted to an I2S output.

In addition to shutting of the CODEC BTL and headphone amplifiers when the dock output jack is used, the BTL amplifier will be disabled when the headphone jacks are used, and the headphone amplifiers will be disabled when not in use.

2.26.1. General conditions in Aux Audio Mode:

HD Audio Link is off (RST# is 0, active, and BitClk is 0, inactive. CODEC does not need to monitor BitClk to enter/exit this mode but must not depend on BitClk to operate.) (Part will enter Aux Audio Mode immediately on application of power if Aux Audio Mode is enabled as default.)

OR

HD Audio CODEC function group power state is set to D3cold and Aux Audio Mode is enabled. (Device enters immediately on transition to D3cold and remains in Aux mode until a double AFG reset event is received or until the next rising edge of RST#)

- HD Audio CODEC analog and digital supplies are active.
- Port A connects to the system microphone jack.
- Port B connects to the system headphone jack.
- Port C is not used
- Port D connects to the internal speakers.
- Port E is connected to the dock Line Out jack/AUX Audio out (it is an output port)
- Port F is connected to the dock Mic Input jack/AUX Audio In (it is an input port)
- The digital microphone clock is generated by the CODEC. The DMIC data is converted to PCM and sent to the Aux Audio Module through the Aux Out port.
- The System microphone jack (Port A) is available to the auxiliary audio subsystem. Vref_Out will be enabled when the system Mic is plugged in.
- EAPD is used to control the power state of the mixer, BTL amplifier, and headphone amplifiers. The amplifiers are off if EAPD is held low.
- Internal circuitry will delay enabling (change power state, un-mute, etc.) the output amplifiers a sufficient amount of time after the application of power or EAPD=1 to prevent pops.
- Internal circuitry will orchestrate power down (EAPD = 0) to prevent pops.
- EAPD must be forced low before removing power.
- No special Dock signal present for the CODEC. Only port presence detect for the dock Line Out (port E) and MinIN (Port F) are used.
- ECR15b operation does not presents a problem. The CODEC will not enter Aux Audio mode unless the function group power state is set to D3cold prior to putting the HD Audio interface into reset (controller D3.) To prevent undesirable behavior (pops, etc.) the bus must not be placed into reset with the clock stopped unless EAPD is forced low or D3cold has been set. The Enable bit in the Aux Audio vendor specific verb is provided so firmware or other software can disable Aux Audio support. The default value of this bit is determined by a bond option and may be determined by reading the device ID. This bit only returns to its default value when a power on reset event is generated or when programmed to that value by software.

2.26.2. Entering Aux Audio Mode

Enter AUX mode under two conditions, refer to figure below:

- When DVDD is powered-up, the value of AUX_enable register is “enabled” (one), and before link reset is de-asserted (pull high).
- If AUX_enable is “enabled” (one) and the Power state is D3cold then chip will also enter AUX mode but the Clock_Stop_OK flag is not required (set to 1 if convenient.). (Note that the part will enter Aux mode immediately upon transition to D3cold. It is possible to return to normal operation by issuing a double AFG reset if the link is still active.)

Note: At that time, Force Portsense and BTL Amp on when we enter link reset if the AuxAudio bit is set. If the AuxAudio bit is not set (by bond option or software) then we will not enter Aux Audio Mode-Portsense and BTL Amp will remain off.

Port F (“dock microphone”) input is routed to Port D (“internal speakers”), Ports B (system head-phone port), and Port E (“dock Line Out”) directly. The analog mixer is disabled to reduce power consumption.

Figure 11. Switching between Normal and Aux Audio Modes

2.26.3. "Playback Path" Port Behavior (Analog I/O)

Port F ("dock microphone") input is routed to Port D ("internal speakers"), Ports B (system headphone port), and Port E ("dock Line Out") directly. The analog mixer is disabled to reduce power consumption.

2.26.4. When Port E presence detect = 0

- Presence detect for Port E = 0 (nothing plugged in)
- If Port B is in use (port presence detect = 1), Port D, internal speakers, will be inactive (off)
- The power supply (charge pump) for B will be inactive if B is not in use.
- If Port B is not in use (port presence detect = 0), Port D, internal speakers, will be active and port B will be inactive.
- EAPD must not be forced low due to the dock being absent or high when a dock is present. EAPD is used to indicate if AUX Audio Mode is in use.

2.26.5. When Port E presence detect = 1

- Presence detect for Port E = 1 (something plugged in)
- Port D is disabled
- If Port B is in use (port presence detect = 1), that port will be enabled and output the audio entering Port F
- The power supply for port B will be active if port B is in use.
- If Port B is not in use (port presence detect = 0), port B will be inactive and the audio on Aux_In will be mixed with the audio from the Secondary Audio input and routed to Port E, the dock headphone jack.
- EAPD must not be forced low due to the dock being absent or high when a dock is present. EAPD is used to indicate if AUX Audio Mode is in use.

EAPD (pin)	Aux Support Enable ¹	Port E detect	Port B detect	Port A, C, F, DMIC detect	Port D behavior	Port B behavior	Port E behavior
0	NA	NA	NA	NA	disabled	disabled	disabled (mute)
1	0	NA	NA	NA	Widget controlled	Widget controlled	Widget controlled
1	1	0	0	NA	enabled (F to D)	disabled	disabled (mute)
1	1	0	1	NA	disabled	enabled (F to B)	disabled (mute)
1	1	1	0	NA	disabled	disabled	enabled Aux+Secondary
1	1	1	1	NA	disabled	enabled (F to B)	disabled (mute)

1.default value for Aux Audio Enable is determined by bond option.

2.26.6. "Record Path" Port Behavior (Analog I/O)

Digital Microphone input DMIC0 is used as an internal microphone port in normal mode. The Digital Microphone clock pin is enabled in Aux Audio Mode and the digital microphone clock is provided by an internal oscillator.

If Port F and Port A presence detect = 0, this indicates that nothing is plugged into the dock or system; the digital microphone input is converted to analog and sent to the Aux Audio Module through Port E. If Port A presence detect = 1, this indicates that an external microphone is plugged into the system jack and port A is sent to the Auxiliary Audio Module through Port E. If Port F presence detect = 1 (and Port A presence detect = 0), this indicates that an external microphone is plugged into the dock. External circuitry routes the dock microphone to the Auxiliary Audio Module.

EAPD (pin)	Aux Support Enable ¹	D Mic0 detect	Port A detect	Port F detect	Ports B, C, E detect	Aux_Out behavior
0	X	X	X	X	NA	disabled
1	0	X	X	X	NA	Widget controlled
1	1	0	0	0	NA	Mute
1	1	1	0	0	NA	DMIC converted to analog and routed to module through port E. DMIC Clock provided by CODEC
1	1	X	0	1	NA	Dock Mic routed to module (not through CODEC) CODEC DMIC interface and Port A disabled

1.default value for Aux Audio Enable is determined by bond option.

2.26.7. SYSTEM DIAGRAMS (Analog I/O)

Figure 12. Aux Audio Playback When Nothing Plugged In (or System is not Docked)

Figure 13. Aux Audio Playback When System Headphones are Plugged In

Figure 14. Aux Audio Playback when the System is Docked and Headphones are Plugged In

Figure 15. Aux Audio Record when Nothing is Plugged In (or The System is not Docked)

Figure 16. Aux Audio Record when the System is Docked with the System Microphone Plugged In

Figure 17. Aux Audio Record when the System is Docked with the Dock Microphone Plugged In

2.26.8. EAPD

Since the Aux Audio mode overrides the default behavior but not the actual port settings when in reset, the logical state of the EAPD pin must be overridden as well. When Aux Audio mode is enabled and the part is in reset as described above, the logical state of EAPD will be 1 (External Amplifier Powered Up) unless held low by an external circuit. This ensures that audio pass-thru and analog PC_Beep will be supported.

2.26.9. Analog PC_Beep

Analog PC_Beep is supported in Aux Audio mode. By default, analog PC_Beep is disabled but may be enabled due to Beep pass-thru support in reset (see the PC_Beep section). If the CODEC is programmed to enable analog PC_Beep and Aux Audio mode is enabled, the next time reset is asserted, the analog PC_Beep pin will be mixed at each of the active outputs.

2.26.10. Class-D BTL Issues

While in Aux Audio mode the HD Audio bus clock (BitClk) is not available. The Class-D controller requires a very high speed clock to operate and an internal clock must be provided. In Aux Audio mode, the actual frequency used by the Class-D controller and its associated ADC will not be exact since an external reference will not be available. The performance characteristics in Aux Audio Mode will be degraded compared to the normal operating mode characteristics specified elsewhere in this document.

2.26.11. Firmware/Software Requirements:

The reconfiguration outlined in this chapter is autonomous (without the help of firmware or OS driver.)

This autonomous mode does not interfere with normal operation.

If it is desirable to stop the HD Audio bus while the CODEC is in D3 under OS control per DCN HDA015-B, no action is required. The CODEC will not enter Aux Audio Mode unless placed in D3cold.

2.27. Microphone Mute Input

Available on silicon revision WB and beyond.

The 92HD91 supports a microphone mute input. An external switch or other circuit may directly mute the CODEC without relying on software control. This is a most helpful feature for allowing the end user to conveniently enforce privacy since it bypasses the record gain/mute functions typically controlled by software. While recording is muted, any active stream will receive digital silence.

3. CHARACTERISTICS

3.1. Electrical Specifications

3.1.1. Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 92HD91. These ratings, which are standard values are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Item	Pin	Maximum Rating
Analog maximum supply voltage	AVdd	6 Volts
Digital maximum supply voltage	DVdd	5.5 Volts
	PVdd	6 Volts
VREFOUT output current		5 mA
Voltage on any pin relative to ground		Vss - 0.3 V to Vdd + 0.3 V
Operating temperature		0 °C to +70 °C -40 °C to +85°C (INDUSTRIAL TEMP, see part number list)
Storage temperature		-55 °C to +125 °C
Soldering temperature		Soldering temperature information for all available in the package section of this datasheet.

Table 18. Electrical Specification: Maximum Ratings

3.1.2. Recommended Operating Conditions

Parameter		Min.	Typ.	Max.	Units
Power Supplies	DVDD_Core	1.6	1.8	1.98	V
	DVDD_IO (3.3V signaling)	3.135	3.3	3.465	V
	DVDD_IO (1.5V signaling)	1.418	1.5	1.583	V
Power Supply Voltage	Digital - 3.3 V	3.135	3.3	3.465	V
	Analog - 5 V	4.75	5	5.25	V
Ambient Operating Temperature		0		+70	°C
Case Temperature	T _{case}			+90	°C
	T _{case} Industrial			+110	°C

Table 19. Recommended Operating Conditions

ESD: The 92HD91 is an ESD (electrostatic discharge) sensitive device. The human body and test equipment can accumulate and discharge electrostatic charges up to 4000 Volts without detection. Even though the 92HD91 implements internal ESD protection circuitry, proper ESD precautions should be followed to avoid damaging the functionality or performance.

3.2. 92HD91 Analog Performance Characteristics

($T_{\text{ambient}} = 25^{\circ}\text{C}$, $\text{AVdd} = 4.75\text{V}$ (4.5-5.25V) or $3.3\text{V} \pm 5\%$, $\text{DVdd} = 3.3\text{V} \pm 5\%$ or $1.8\text{V} \pm 10\%$, $\text{AVss}=\text{DVss}=0\text{V}$; 20Hz to 20KHz swept sinusoidal input; Sample Frequency = 48 kHz; 0dB FS = 1Vrms for $\text{AVdd} = 4.75\text{V}$ and 0.71Vrms for $\text{AVdd} = 3.3\text{V}$, 10K Ω //50pF load, Testbench Characterization BW: 20 Hz – 20 kHz, 0 dB settings on all gain stages)

Table 20. 92HD91 Analog Performance Characteristics

1. Dynamic Range is the ratio of the full scale signal to the noise output with a -60dBFS signal as defined in AES17 as SNR in the presence of signal and outlined in AES6id, measured "A weighted" over 20 Hz to 20 kHz bandwidth
2. Ratio of Full Scale signal to idle channel noise output is measured "A weighted" over a 20 Hz to a 20 kHz bandwidth. (AES17-1991 Idle Channel Noise or EIAJ CP-307 Signal-to-noise Ratio).
3. THD+N ratio as defined in AES17 and outlined in AES6id, non-weighted, over 20 Hz to 20 kHz bandwidth. Results at the jack are dependent on external components and will likely be 1 - 2dB worse.
4. Peak-to-Peak Ripple over Passband meets ± 0.125 dB limits, 48 kHz or 44.1 kHz Sample Frequency. 1dB limit.
5. Peak-to-Peak Ripple over Passband meets ± 0.125 dB limits, 48 kHz or 44.1 kHz Sample Frequency. 1dB limit.
6. Stop Band rejection determines filter requirements. Out-of-Band rejection determines audible noise.
7. The integrated Out-of-Band noise generated by the DAC process, during normal PCM audio playback, over a bandwidth 28.8 to 100 kHz, with respect to a 1 Vrms DAC output.
8. ± 1 dB limits for Line Output & 0 dB gain, at -20dBV
9. Spurious tone rejection is tested with ADC dither enabled and compared to ADC performance without dither.
10. All functions/converters active, pin complexes enabled, two FDX streams, line (10Kohm) loads. Add 24mA analog current per stereo 32 ohm headphone.
11. One stereo DAC and corresponding pin widgets enabled (playback mode)
12. Mixer enabled
13. Idle measurement D3 set for minimum clicks/pops (biases and min. amps. on)
14. Can be set to 0.5 or 0.8 AVdd.

3.3. Class-D BTL Amplifier Performance

Parameter	Min	Typ	Max	Unit
Output Power (BTL 4 ohm, 5V, <1% THD+N)	2			W
Output Power (BTL 4 ohm, 5V, <10% THD+N)		3		W
Amplifier Efficiency η (4 Ω , 5V, 2W)		86		%
THD+N (BTL 4 Ω , 5V, FS)			1	%

Table 29. Command Format for Verb with 12-bit Identifier

There are two types of responses: Solicited and Unsolicited. Solicited responses are provided as a direct response to an issued command and will be provided in the frame immediately following the command. Unsolicited responses are provided by the CODEC independent of any command. Unsolicited responses are the result of CODEC events such as a jack insertion detection. The formats for Solicited Responses and Unsolicited Responses are shown in the tables below. The “Tag” field in bits [31:28] of the Unsolicited Response identify the event.

Bit [35]	Bit [34]	BITS [33:32]	BITS[31:0]

0Dh	Port D	Port D Pin Widget (Class-D BTL output)
0Eh	Port E	Port E Pin Widget (Line IN/OUT, MIC)
0Fh	Port F	Port F Pin Widget (Line IN/OUT, MIC)
10h	MonoOut	MonoOut Pin Widget (Output Only)
11h	DigMic0	Digital Microphone 0 Pin Widget
12h	DigMic1 Vol	Vendor Specific Widget - D-Mic1 volume (D pin to A mux connection)
13h	DAC0	Stereo Output Converter to DAC
14h	DAC1	Stereo Output Converter to DAC
15h	ADC0	Stereo Input Converter to ADC
16h	ADC1	Stereo Input Converter to ADC
17h	ADC0Mux	ADC0 Mux with volume and mute
18h	ADC1Mux	ADC1 Mux with volume and mute
19h	Mono_Mux	Mono output source select
1Ah	Mono_Mix	Stereo to mono conversion
1Bh	Mixer	Input Mixer (Input Ports, DACs, Analog PC_Beep)
1Ch	MixerOutVol	Volume control for analog mixer
1Dh	SPDIFOut0	Stereo Output for SPDIF_Out
1Eh	SPDIFOut1	Second Stereo Output for SPDIF_Out
1Fh	Dig0Pin	First Digital Output Pin (pin48)
20h	Dig1Pin	Second Digital Output Pin / DMIC Input Pin (pin 46)
21h	PCBeep	Digital PC Beep
22h	VSW	Vendor Defined Widget

Table 32. Widget List

7.2. Reset Key

Abbreviation	Description
POR	Power On Reset.
SAFG	Single AFG Reset - One single write to the Reset Verb in the AFG Node.
DAFG	Double AFG Reset - Two consecutive Single AFG Resets with only idle frames (if any) and no Link Resets between.
S&DAFG	Single And Double AFG Reset - Either one will cause reset.
LR	Link Reset - Level sensitive reset anytime the HDA Reset is set low.
ELR	Exiting Link Reset - Edge sensitive reset any time the HDA Reset transitions from low to high.
ULR	Unexpected Link Reset - Level sensitive reset anytime the HDA Reset is set low when the ClkStopOK indicator is currently set to 0.
PS	Power State Change - Reset anytime the Actual Power State changes for the Widget in question.

7.3. Root (NID = 00h): VendorID

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				
Get	F0000h			

Field Name	Bits	R/W	Default	Reset
Vendor	31:16	R	111Dh	N/A
	Vendor ID.			
DeviceFix	15:8	R	see below	N/A
	Device ID.			
DeviceProg	7:0	R	see below	N/A
	Device ID.			

Device	92HD91
Device ID	76E0h

7.3.1. Root (NID = 00h): RevID

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				
Get	F0002h			

Field Name	Bits	R/W	Default	Reset
Rsvd	31:24	R	00h	N/A (Hard-coded)
	Reserved.			
Major	23:20	R	1h	N/A (Hard-coded)
	Major rev number of compliant HD Audio spec.			
Minor	19:16	R	0h	N/A (Hard-coded)
	Minor rev number of compliant HD Audio spec.			
RevisionFix	15:12	R	xh	N/A (Hard-coded)
	Vendor's rev number for this device.			
RevisionProg	11:8	R	xh	N/A (Hard-coded)
	Vendor's rev number for this device.			
SteppingFix	7:4	R	xh	N/A (Hard-coded)
	Vendor stepping number within the Vendor RevID.			
SteppingProg	3:0	R	xh	N/A (Hard-coded)
	Vendor stepping number within the Vendor RevID.			

7.3.2. Root (NID = 00h): NodeInfo

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				
Get	F0004h			

Field Name	Bits	R/W	Default	Reset
Rsvd2	31:24	R	00h	N/A (Hard-coded)
	Reserved.			

Field Name	Bits	R/W	Default	Reset
StartNID	23:16	R	01h	N/A (Hard-coded)
	Starting node number (NID) of first function group			
Rsvd1	15:8	R	00h	N/A (Hard-coded)
	Reserved.			
TotalNodes	7:0	R	01h	N/A (Hard-coded)
	Total number of nodes			

7.4. AFG (NID = 01h): NodeInfo

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				
Get	F0004h			

Field Name	Bits	R/W	Default	Reset
Rsvd2	31:24	R	00h	N/A (Hard-coded)
	Reserved.			
StartNID	23:16	R	0Ah	N/A (Hard-coded)
	Starting node number for function group subordinate nodes.			
Rsvd1	15:8	R	00h	N/A (Hard-coded)
	Reserved.			
TotalNodes	7:0	R	19h	N/A (Hard-coded)
	Total number of nodes.			

7.4.1. AFG (NID = 01h): FGType

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				
Get	F0005h			

Field Name	Bits	R/W	Default	Reset
Rsvd	31:9	R	000000h	N/A (Hard-coded)
	Reserved.			
UnSol	8	R	1h	N/A (Hard-coded)
	Unsolicited response supported: 1 = yes, 0 = no.			
NodeType	7:0	R	1h	N/A (Hard-coded)
	Function group type: 00h = Reserved 01h = Audio Function Group 02h = Vendor Defined Modem Function Group 03h-7Fh = Reserved 80h-FFh = Vendor Defined Function Group			

7.4.2. AFG (NID = 01h): AFGCap

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				
Get	F0008h			

Field Name	Bits	R/W	Default	Reset
Rsvd3	31:17	R	00h	N/A (Hard-coded)
	Reserved.			
BeepGen	16	R	1h	N/A (Hard-coded)
	Beep generator present: 1 = yes, 0 = no.			
Rsvd2	15:12	R	0h	N/A (Hard-coded)
	Reserved.			
InputDelay	11:8	R	Dh	N/A (Hard-coded)
	Typical latency in frames. Number of samples between when the sample is received as an analog signal at the pin and when the digital representation is transmitted on the HD Audio link.			
Rsvd1	7:4	R	0h	N/A (Hard-coded)
	Reserved.			

Field Name	Bits	R/W	Default	Reset
OutputDelay	3:0	R	Dh	N/A (Hard-coded)
	Typical latency in frames. Number of samples between when the signal is received from the HD Audio link and when it appears as an analog signal at the pin.			

7.4.3. AFG (NID = 01h): PCMCap

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				
Get	F000Ah			

Field Name	Bits	R/W	Default	Reset
Rsvd2	31:21	R	000h	N/A (Hard-coded)
	Reserved.			
B32	20	R	0h	N/A (Hard-coded)
	32 bit audio format support: 1 = yes, 0 = no.			
B24	19	R	1h	N/A (Hard-coded)
	24 bit audio format support: 1 = yes, 0 = no.			
B20	18	R	1h	N/A (Hard-coded)
	20 bit audio format support: 1 = yes, 0 = no.			
B16	17	R	1h	N/A (Hard-coded)
	16 bit audio format support: 1 = yes, 0 = no.			
B8	16	R	0h	N/A (Hard-coded)
	8 bit audio format support: 1 = yes, 0 = no.			
Rsvd1	15:12	R	0h	N/A (Hard-coded)
	Reserved.			
R12	11	R	0h	N/A (Hard-coded)
	384kHz rate support: 1 = yes, 0 = no.			
R11	10	R	1h	N/A (Hard-coded)
	192kHz rate support: 1 = yes, 0 = no.			

Field Name	Bits	R/W	Default	Reset
R10	9	R	0h	N/A (Hard-coded)
	176.4kHz rate support: 1 = yes, 0 = no.			
R9	8	R	1h	N/A (Hard-coded)
	96kHz rate support: 1 = yes, 0 = no.			
R8	7	R	1h	N/A (Hard-coded)
	88.2kHz rate support: 1 = yes, 0 = no.			
R7	6	R	1h	N/A (Hard-coded)
	48kHz rate support: 1 = yes, 0 = no.			
R6	5	R	1h	N/A (Hard-coded)
	44.1kHz rate support: 1 = yes, 0 = no.			
R5	4	R	0h	N/A (Hard-coded)
	32kHz rate support: 1 = yes, 0 = no.			
R4	3	R	0h	N/A (Hard-coded)
	22.05kHz rate support: 1 = yes, 0 = no.			
R3	2	R	0h	N/A (Hard-coded)
	16kHz rate support: 1 = yes, 0 = no.			
R2	1	R	0h	N/A (Hard-coded)
	11.025kHz rate support: 1 = yes, 0 = no.			
R1	0	R	0h	N/A (Hard-coded)
	8kHz rate support: 1 = yes, 0 = no.			

7.4.4. AFG (NID = 01h): StreamCap

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				
Get	F000Bh			

Field Name	Bits	R/W	Default	Reset
Rsvd	31:3	R	00000000h	N/A (Hard-coded)
	Reserved.			
AC3	2	R	0h	N/A (Hard-coded)
	AC-3 formatted data support: 1 = yes, 0 = no.			
Float32	1	R	0h	N/A (Hard-coded)
	Float32 formatted data support: 1 = yes, 0 = no.			
PCM	0	R	1h	N/A (Hard-coded)
	PCM-formatted data support: 1 = yes, 0 = no.			

7.4.5. AFG (NID = 01h): InAmpCap

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				
Get	F000Dh			

Field Name	Bits	R/W	Default	Reset
Mute	31	R	0h	N/A (Hard-coded)
	Mute support: 1 = yes, 0 = no.			
Rsvd3	30:23	R	00h	N/A (Hard-coded)
	Reserved.			
StepSize	22:16	R	27h	N/A (Hard-coded)
	Size of each step in the gain range: 0 to 127 = .25dB to 32dB, in .25dB steps.			
Rsvd2	15	R	0h	N/A (Hard-coded)
	Reserved.			
NumSteps	14:8	R	03h	N/A (Hard-coded)
	Number of gains steps (number of possible settings - 1).			
Rsvd1	7	R	0h	N/A (Hard-coded)
	Reserved.			

Field Name	Bits	R/W	Default	Reset
Offset	6:0	R	00h	N/A (Hard-coded)
Indicates which step is 0dB				

7.4.6. AFG (NID = 01h): PwrStateCap

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				
Get	F000Fh			

Field Name	Bits	R/W	Default	Reset
EPSS	31	R	1h	N/A (Hard-coded)
Extended power states support: 1 = yes, 0 = no.				
ClkStop	30	R	1h	N/A (Hard-coded)
D3 clock stop support: 1 = yes, 0 = no.				
S3D3ColdSup	29	R	1h	N/A (Hard-coded)
Codec state intended during system S3 state: 1 = D3Hot, 0 = D3Cold.				
Rsvd	28:5	R	000000h	N/A (Hard-coded)
Reserved.				
D3ColdSup	4	R	1h	N/A (Hard-coded)
D3Cold power state support: 1 = yes, 0 = no.				
D3Sup	3	R	1h	N/A (Hard-coded)
D3 power state support: 1 = yes, 0 = no.				
D2Sup	2	R	1h	N/A (Hard-coded)
D2 power state support: 1 = yes, 0 = no.				
D1Sup	1	R	1h	N/A (Hard-coded)
D1 power state support: 1 = yes, 0 = no.				
D0Sup	0	R	1h	N/A (Hard-coded)
D0 power state support: 1 = yes, 0 = no.				

7.4.7. AFG (NID = 01h): GPIOCnt

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				
Get	F0011h			

Field Name	Bits	R/W	Default	Reset
GPIWake	31	R	1h	N/A (Hard-coded)
	Wake capability. Assuming the Wake Enable Mask controls are enabled, GPIO's configured as inputs can cause a wake (generate a Status Change event on the link) when there is a change in level on the pin.			
GPIUnsol	30	R	1h	N/A (Hard-coded)
	GPIO unsolicited response support: 1 = yes, 0 = no.			
Rsvd	29:24	R	00h	N/A (Hard-coded)
	Reserved.			
NumGPIs	23:16	R	00h	N/A (Hard-coded)
	Number of GPI pins supported by function group.			
NumGPOs	15:8	R	00h	N/A (Hard-coded)
	Number of GPO pins supported by function group.			
NumGPIOs	7:0	R	05h	N/A (Hard-coded)
	Number of GPIO pins supported by function group.			

7.4.8. AFG (NID = 01h): OutAmpCap

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				
Get	F0012h			

Field Name	Bits	R/W	Default	Reset
Mute	31	R	1h	N/A (Hard-coded)
	Mute support: 1 = yes, 0 = no.			

Field Name	Bits	R/W	Default	Reset
Rsvd3	30:23	R	00h	N/A (Hard-coded)
	Reserved.			
StepSize	22:16	R	02h	N/A (Hard-coded)
	Size of each step in the gain range: 0 to 127 = .25dB to 32dB, in .25dB steps.			
Rsvd2	15	R	0h	N/A (Hard-coded)
	Reserved.			
NumSteps	14:8	R	7Fh	N/A (Hard-coded)
	Number of gains steps (number of possible settings - 1).			
Rsvd1	7	R	0h	N/A (Hard-coded)
	Reserved.			
Offset	6:0	R	7Fh	N/A (Hard-coded)
	Indicates which step is 0dB			

7.4.9. AFG (NID = 01h): PwrState

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				705h
Get	F0500h			

Field Name	Bits	R/W	Default	Reset
Rsvd3	31:11	R	000000h	N/A (Hard-coded)
	Reserved.			
SettingsReset	10	R	1h	POR - DAFG - ULR
	Indicates if any persistent settings in this Function Group have been reset. Cleared by PwrState 'Get' to this Widget.			
ClkStopOK	9	R	1h	POR - DAFG - ULR
	Bit clock can currently be removed: 1 = yes, 0 = no.			
Error	8	R	0h	POR - DAFG - ULR
	Error indicator: 1 = cannot enter requested power state, 0 = no problem with requested power state.			

Field Name	Bits	R/W	Default	Reset
Rsvd2	7	R	0h	N/A (Hard-coded)
	Reserved.			
Act	6:4	R	3h	POR - DAFG - LR
	Actual power state of this widget.			
Rsvd1	3	R	0h	N/A (Hard-coded)
	Reserved.			
Set	2:0	RW	3h	POR - DAFG - LR
	Current power state setting for this widget.			

7.4.10. AFG (NID = 01h): UnsolResp

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				708h
Get	F0800h			

Field Name	Bits	R/W	Default	Reset
Rsvd2	31:8	R	000000h	N/A (Hard-coded)
	Reserved.			
En	7	RW	0h	POR - DAFG - ULR
	Unsolicited response enable: 1 = enabled, 0 = disabled.			
Rsvd1	6	R	0h	N/A (Hard-coded)
	Reserved.			
Tag	5:0	RW	00h	POR - DAFG - ULR
	Software programmable field returned in top six bits (31:26) of every Unsolicited Response generated by this node.			

7.4.11. AFG (NID = 01h): GPIO

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)
Set				715h
Get	F1500h			

Field Name	Bits	R/W	Default	Reset
Rsvd	31:5	R	00000000h	N/A (Hard-coded)
	Reserved.			
Data4	4	RW	0h	POR - DAFG - ULR
	Data for GPIO4. If this GPIO bit is configured as Sticky (edge-sensitive) input, it can be cleared by writing "0". For details of read back value, refer to HD Audio spec. section 7.3.3.22			
Data3	3	RW	0h	POR - DAFG - ULR
	Data for GPIO3. If this GPIO bit is configured as Sticky (edge-sensitive) input, it can be cleared by writing "0". For details of read back value, refer to HD Audio spec. section 7.3.3.22			
Data2	2	RW	0h	POR - DAFG - ULR
	Data for GPIO2. If this GPIO bit is configured as Sticky (edge-sensitive) input, it can be cleared by writing "0". For details of read back value, refer to HD Audio spec. section 7.3.3.22			
Data1	1	RW	0h	POR - DAFG - ULR
	Data for GPIO1. If this GPIO bit is configured as Sticky (edge-sensitive) input, it can be cleared by writing "0". For details of read back value, refer to HD Audio spec. section 7.3.3.22			
Data0	0	RW	0h	POR - DAFG - ULR
	Data for GPIO0. If this GPIO bit is configured as Sticky (edge-sensitive) input, it can be cleared by writing "0". For details of read back value, refer to HD Audio spec. section 7.3.3.22			

7.4.12. AFG (NID = 01h): GPIOEn

Reg	Byte 4 (Bits 31:24)	Byte 3 (Bits 23:16)	Byte 2 (Bits 15:8)	Byte 1 (Bits 7:0)

7.29.1.1. SPKVOL L/R Registers

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F71/771 (Left) verb F72/772 (Right) verb 773 (Left and Right - write only)	7:0	VOL[7:0]	RW	30	+36 to -91.5dB in 0.75dB steps 0x00 = +36dB 0x01 = +35.25dB ... 0x2F = +0.75dB 0x30 = 0dB 0x31 = -0.75dB ... 0xA9 = -90.75 0xAA to 0xFE = -91.5dB 0xFF = mute

7.29.1.2. PWRM Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F79/779	7	RSVD	RO	0	Reserved
	6	RSVD	RO	0	Reserved
	5	RSVD	RO	0	Reserved
	4	HPPWD	RW	0	Headphone ports are forced off in Aux Audio Mode (including charge pump)
	3	SPKRON	RW	0	BTL (port D) is forced on in Aux Audio Mode
	2	DMICPWD	RW	0	DMIC powered down in Aux Audio Mode (including DAC)
	1	RSVD	RW	0	Reserved
	0	RSVD	RW	0	Reserved

7.29.1.3. RESET Register

Register Address	Bit	Label	Type	Default	Description
verb F7F/77F	7:0	RESET	RW	0	Writing causes registers to revert to their default values (similar to a function group reset)

7.29.1.4. STATUS Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F80/780	7	limit1latch	RO	0	Latched version of limit1, clear via GAINCTRL_LO[7]
	6	limit0latch	RO	0	Latched version of limit0, clear via GAINCTRL_LO[7]
	5:3	Reserved	RO	0x0	RESERVED
	2	limit1	RO	0	Set (1) if regz saturation after gain multiply for CH1. may change on a sample by sample basis.
	1	limit0	RO	0	Set (1) if regz saturation after gain multiply for CH0. may change on a sample by sample basis.
	0	zerodet_flag	RO	0	Set when input zero detect of long string of zeroes.

7.29.1.5. INIT Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F81/781	7:4	Reserved	RO	0	RESERVED
	3	anabeep_dcbyb	RW	0	1 = bypass analog Beep DC filter
	2:1	anabeep_dc_coef	RW	0x2	0: dc_coef = 24'h004000; 1: dc_coef = 24'h001000; 2: dc_coef = 24'h000400; 3: dc_coef = 24'h000100;
	0	Initialize	RW	0	1= Initialize/soft reset data path. Must be set when changing the config0 or config1 registers.

7.29.1.6. CONFIG Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F82/782	7	BPFBYBYP	RW	0	1= Bypass MonoOut band-pass filter
	6	PREBYBYP	RW	1	1= Bypass BTL EQ filter prescale
	5	EQBYBYP	RW	1	1= Bypass BTL EQ filter

	3:1	Reserved	RO	0	RESERVED
	0	HPFBYP	RW	0	1= Bypass BTL high-pass filter (not DC removal filter)

7.29.1.7. PWM4 Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F83/783	7	sc_status_clear_right	RWC	0	Write once operation will clear sc_fault_status_right
	6	sc_status_clear_left	RWC	0	Write once operation will clear sc_fault_status_left
	5	Reserved	RO	0	RESERVED
	4	sc_Fault_status_right	RO	0	1 = Fault occurs on right channel
	3	sc_Fault_status_left	RO	0	1 = Fault occurs on left channel
	2:1	scdly_set	RW	00	Used for short circuit detection; designer will set the value
	0	evenbit	RW	0	1=Noise Shaper output data are even

7.29.1.8. PWM3 Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F84/784	7:6	outctrl	RW	0	pwm output muxing 0 = normal 1 = swap 0/1 2 = ch0 on both 3 = ch1 on both
	5:0	cvalue	RW	0x2	Tristate constant value filed, must be even and not 0

7.29.1.9. PWM2 Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F85/785	7:2	dvalue	RW	0x10	dvalue constant field.
	1	pwm_outflip	RW	0	1= swap pwm a/b output pair for all channels
	0	pwm_outmode	RW	1	1= tristate, 0 = binary

7.29.1.10. PWM1 Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F86/786	7	Reserved	RO	0	RESERVED
	6:2	dithpos	RW	0	Dither position, where dither inserted after NS 0,1,2 = dither bits 2:0 4 = dither bits 3:1 5 = dither bits 4:1 ... 19 = dither bits 19:17
	1	dither_range	RW	0	1= dither -1 to +1, 0 = dither -3 to +3
	0	dithclr	RW	0	1 = disable dither

7.29.1.11. PWM0 Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F87/787	7:6	PhaseOffset	RW	01	PWM ch1 offset from ch0 at 8x sample rate by: 00 = 0 degrees 01 = 90 degrees 10 = 180 degrees 11 = NA
	5	clk320mode	R	1	1 = PCA clock 320 mode 0 = PCA clock 294 mode
	4	roundup	RW	1	1= roundup, 0 = truncate for quantizer
	3	bfcldr	RW	0	1 = disable binomial filter
	2	fourthorder	RW	0	1 = fourth order binomial filter, 0 = 3rd order binomial filter
	1	add3_sel	RW	0	1 = 24-bit Noise Shaper output (pre-quantizer), 0 = 8/9/10-bit quantizer output
	0	Btl_test_mode	RW	0	1 = power stage test mode

7.29.1.12. LMTCTRL Register

Control operation of the volume Limiter (Compressor).

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F88/788	7:4	–	RO	0	Reserved for future use.
	3	zerocross	RW	0	1 = only change limiter gain value on zero cross.
	2:1	stepsize	RW	0	Gain stepsize when incrementing or decrementing: 0 - 0.75 dB, 1 - 1.5 dB, 2 - 3.0 dB, 3 - 6.0 dB
	0	limiter_en	RW	0	1 = enable limiter (compressor)

7.29.1.13. LMTATKTIME (0x19), LMTHOLDTIME (0x1A), LMTRELTIME (0x1B) Registers

These 8-bit registers set the timer values between incrementing/decrementing the Compressor attenuation values. There is one register each for Attack, Hold, and Release times, the configuration parameters are the same for all three and are shown in the table below.

Prior to WC revision, these registers reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions..

Register Address	Bit	Label	Type	Default	Description
verb F89/789	7	ATK10ms	RW	0	1 = value in bits 6:0 is in 10ms units, otherwise 1ms units.
	6:0	LMTAT[6:0]	RW	0	Timer value in units of 1 or 10ms.

Register Address	Bit	Label	Type	Default	Description
verb F8A/78A	7	HOLD10ms	RW	0	1 = value in bits 6:0 is in 10ms units, otherwise 1ms units.
	6:0	LMTHT[6:0]	RW	0	Timer value in units of 1 or 10ms.

Register Address	Bit	Label	Type	Default	Description
verb F8B/78B	7	REL10ms	RW	0	1 = value in bits 6:0 is in 10ms units, otherwise 1ms units.
	6:0	LMTRT[6:0]	RW	0	Timer value in units of 1 or 10ms.

7.29.1.14. LMTATKTH (0x1D–LO, 0x1C–HI), LMTRELTH (0x1F–LO, 0x1E–HI) Registers

These 16-bit registers set the threshold values. When in attack phase and the Attack Threshold is exceeded the Compressor attenuation is incremented by stepsize (see LMTCTRL). When in release phase and the Release Threshold is not exceeded the Compressor attenuation is incremented by stepsize (but not above 0)

Prior to WC revision, these registers reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions..

Register Address	Bit	Label	Type	Default	Description
verb F8C/78C	7:0	LATKTH[15:8]	RW	7F	8'hFF would equal threshold level of +2.0dB. Each step below this 8-bit full scale value reduces threshold level by 0.0078 dB.

92HD91

SINGLE CHIP PC AUDIO SYSTEM, CODEC+SPEAKER AMPLIFIER+CAPLESS HP+LDO

Register Address	Bit	Label	Type	Default	Description
verb F8D/78D	7:0	LATKTH[7:0]	RW	FF	Always 0. It isn't necessary to provide threshold resolution to the point where these lower 8 bits would be used.

Register Address	Bit	Label	Type	Default	Description
verb F8E/78E	7:0	LRELTH[15:8]	RW	0	8'hFF would equal threshold level of +2.0dB. Each step below this 8-bit full scale value reduces threshold level by 0.0078 dB.

Register Address	Bit	Label	Type	Default	Description
verb F8F/78F	7:0	LRELTH[7:0]	RW	0	Always 0. It isn't necessary to provide threshold resolution to the point where these lower 8 bits would be used.

7.29.1.15. GAINCTRL_HI Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F90/790	7:5	Reserved	RO	0	RESERVED
	4:3	zerodetlen	RW	0x2	enable mute if input consecutive zeros exceeds this length: 00 = 32 01 = 1000 10 = 2000 11 = 4000
	2:0	step_time	RW	0x5	step time units = 1<<step_time, units in GAINCTRL_LO bit 5

7.29.1.16. GAINCTRL_LO Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F91/791	7	clr_latch	RW	0	1 = clear limit 0/1 latches, see STATUS register
	6	RSVD	RO	0	Reserved
	5	step_10ms	RW	0	1 = units for step_time are 10ms 0 = units for step_time are 1ms
	4	stepped_change	RW	0	1 = step volume progressively to new setting
	3	disable_gain	RW	0	1 = disable all gain functions (bypass gain multiply)
	2	auto_mute	RW	1	1 = auto mute if detect long strings of zeros on input
	1	change_mode	RW	0	1 = change gain immediately 0 = change on zero cross
	0	mute_mode	RW	1	1 = hard mute after reset, 0 = soft mute

7.29.1.17. MUTE Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F92/792	7:3	Reserved	RO	0x0	RESERVED
	2	Mute	RW	0	1 = mute all channels
	1	mute1	RW	0	1 = mute ch1
	0	mute0	RW	0	1 = mute ch0

7.29.1.18. ATTEN Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F93/793	7:0	atten	RW	0x0	Attenuation. Each bit represents 0.5dB of attenuation to be applied to the channel. The range will be -125dB to 2dB as follows: 0x00: +2dB 0x01: +1.5dB 0x02: +1.0dB ... 0x47: -33.5dB 0x48: -34.0dB 0x49: -34.5dB ... 0xFE: -125dB 0xFF: Hard Master Mute

7.29.1.19. DC_COEF_SEL Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F94/794	7:3	Reserved	RO	0	RESERVED
	2:0	dc_coef_sel	RW	0x5	0:dc_coef = 24'h100000; //2 ⁻³ = 0.125 1:dc_coef = 24'h040000; 2:dc_coef = 24'h010000; 3:dc_coef = 24'h004000; 4:dc_coef = 24'h001000; 5:dc_coef = 24'h000400; 6:dc_coef = 24'h000100; //2 ⁻¹⁵ = 0.000330517 7:dc_coef = 24'h000040; //2 ⁻¹⁷

7.29.1.20. BTL High-Pass Filter COEF_SEL Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F95/795	7:3	Reserved	RO	0	RESERVED
	2:0	hp_coef_sel	RW	0x2	Select IIR coefficients for BTL amplifier high pass filter corner frequency 000 = 100Hz 001 = 200Hz 010 = 300Hz 011 = 400Hz 100 = 500Hz 101 = 750Hz 110 = 1000Hz 111 = 2000Hz

7.29.1.21. Mono Band-Pass Filter COEF_SEL Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause reset on all silicon revisions.

Register Address	Bit	Label	Type	Default	Description
verb F96/796	7	Reserved	RO	0	RESERVED
	6:4	bph_coef_sel	RW	0x3	Select IIR coefficients for MonoOut band-pass filter lower corner frequency 000 = 63Hz 001 = 80Hz 010 = 100Hz 011 = 120Hz 100 = 150Hz 101 = 200Hz 110 = 315Hz 111 = 400Hz
	3	Reserved	RO	0	RESERVED
	2:0	bpl_coef_sel	RW	0x2	Select IIR coefficients for MonoOut band-pass filter upper corner frequency 000 = 150Hz 001 = 200Hz 010 = 250Hz 011 = 315Hz 100 = 400Hz 101 = 500Hz 110 = 630Hz 111 = 800Hz

7.29.1.22. BTL Class-D Power Stage Register Settings

Prior to WC revision, these registers reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause NOT generate a reset.

Register Address	Bit	Label	Type	Default	Description
verb F97/797	7	ENABLE	RW	1	1 = Enable BTL Power stage
	6	TRC_ESD	RO	0	1 = ESD trigger detected 0 = No trigger
	5	STRENDRV	RW	0	1 = Strengthen pre-drive 0 = Normal
	4:3	SCTHR	RW	01	Short circuit threshold current 00 = 10% of PVDD 01 = 14% of PVDD 10 = 16% of PVDD 11 = 20% of PVDD
	2:0	DEADTIME	RW	001	Dead time for output FETs 000 = 0.5ns 001 = 1.0ns 010 = 1.5ns 011 = 2ns 100 = 4ns 101 = 8ns 110 = 8ns 111 = 8ns

Register Address	Bit	Label	Type	Default	Description
verb F98/798	7	TEST_EN	RW	0	1 = Enable short circuit test
	6	SC_DIS	RW	0	1 = disable short circuit protection
	5	RSVD	RW	0	Reserved
	4	FAULT_SC	RO	0	1 = Fault
	3	RSVD	RW	0	Reserved
	2	PNSEL	RW	0	1=PFET tested, 0=NFET tested
	1	FORCE_SC	RW	0	1 = force short circuit
	0	TEST	RW	0	1 = Pos PFET / Neg NFET on, 0 = Pos NFET / Neg PFET on

92HD91**SINGLE CHIP PC AUDIO SYSTEM, CODEC+SPEAKER AMPLIFIER+CAPLESS HP+LDO**

7.29.1.23. LDO LEVEL CONTROL Register

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will cause NOT generate a reset.

Register Address	Bit	Label	Type	Default	Description
verb F9B/79B	7:3	Reserved	RO	0x0	RESERVED
	2	Lv_QUAD_BIAS	RW	0	
	1:0	Lv_reg_cntrl_bit	RW	0x0	Two bits are defined to program the output of the 1.8V LDO 00 = normal operation (3.3V in to 1.8V out) 01 = $1.8V \times 1.1 = 1.98V$ 10 = $1.8V \times 0.9 = 1.62V$ 11 = power down LDO/bypass. When disabled, the DVDD_Core pin must be supplied with a nominal 1.8V from an external source.

7.29.1.24. EQRAM

The EQ RAM is a 52 x 48-bit SRAM that contains the EQ coefficients

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only OR when a BIST is run under certain conditions, contact TSI for more information. Writing to NID22h verb 77F will cause NOT generate a reset..

0x32	EQ_COEF_F4_A2	EQ_COEF_F4_A2
0x33	EQ_PRESCALE	EQ_PRESCALE

The EQRAM is programmed indirectly through the Control Bus in the following manner:

- 1) Write the 48-bit write data to the EQRAM_WRITE register
- 2) Write the target address to the EQ_ADDRESS register
- 3) Set bit 7 of the EQRAM_CTRL register

The write will occur when the EQRAM is not being accessed by the DSP audio processing routines. When complete the hardware will automatically clear this bit.

Reading back from the EQRAM is done in the following manner:

- 1) Write target address to EQ_ADDR register
- 2) Set bit 6 of the EQRAM_CTRL register

When the hardware completes the read it will automatically clear this bit.

- 3) When bit 6 of the EQRAM_CTRL register has been cleared, read the 48bit data from the EQRAM_READ register.

7.29.1.25. EQRAM Read Data (0x30–0x35), EQRAM Write Data (0x36–3B) Registers

These two 48-bit registers (addressed as 12 8-bit registers) are 48-bit data holding registers used when doing indirect writes/reads to the EQRAM

Prior to WC revision, these registers reset by POR/DAFG/ULR. WC revision, reset by POR only Writing to NID22h verb 77F will cause NOT generate a reset to EQRAMREAD registers, it will however work for EQRAMWRITE registers.]]

Register Address	Bit	Label	Type	Default	Description
EQRAM_READ[47:40] verb FA0/7A0	7:0	EQRD[47:40]	RW	0x00	48-bit data register, contains the contents of the most recent EQRAM address read from the RAM. The address read will have been specified by the EQRAM Address fields.

Register Address	Bit	Label	Type	Default	Description
EQRAM_READ[39:32] verb FA1/7A1	7:0	EQRD[39:32]	RW	0x00	48-bit data register, contains the contents of the most recent EQRAM address read from the RAM. The address read will have been specified by the EQRAM Address fields.

Register Address	Bit	Label	Type	Default	Description
EQRAM_READ[31:24] verb FA2/7A2	7:0	EQRD[31:24]	RW	0x00	48-bit data register, contains the contents of the most recent EQRAM address read from the RAM. The address read will have been specified by the EQRAM Address fields.

Register Address	Bit	Label	Type	Default	Description
EQRAM_READ[23:16] verb FA3/7A3	7:0	EQRD[23:16]	RW	0x00	48-bit data register, contains the contents of the most recent EQRAM address read from the RAM. The address read will have been specified by the EQRAM Address fields.

Register Address	Bit	Label	Type	Default	Description
EQRAM_READ[15:8] verb FA4/7A4	7:0	EQRD[15:8]	RW	0x00	48-bit data register, contains the contents of the most recent EQRAM address read from the RAM. The address read will have been specified by the EQRAM Address fields.

Register Address	Bit	Label	Type	Default	Description
EQRAM_READ[7:0] verb FA5/7A5	7:0	EQRD[7:0]	RW	0x00	48-bit data register, contains the contents of the most recent EQRAM address read from the RAM. The address read will have been specified by the EQRAM Address fields.

Register Address	Bit	Label	Type	Default	Description
EQRAM_WRITE[47:40] verb FA6/7A6	7:0	EQWD[47:40]	RW	0x00	48-bit data register, contains the values to be written to the EQRAM. The address written will have be specified by the EQRAM Address fields.

Register Address	Bit	Label	Type	Default	Description
EQRAM_WRITE[39:32] verb FA7/7A7	7:0	EQWD[39:32]	RW	0x00	48-bit data register, contains the values to be written to the EQRAM. The address written will have be specified by the EQRAM Address fields.

Register Address	Bit	Label	Type	Default	Description
EQRAM_WRITE[31:24] verb FA8/7A8	7:0	EQWD[31:24]	RW	0x00	48-bit data register, contains the values to be written to the EQRAM. The address written will have be specified by the EQRAM Address fields.

Register Address	Bit	Label	Type	Default	Description
EQRAM_WRITE[23:16] verb FA9/7A9	7:0	EQWD[23:16]	RW	0x00	48-bit data register, contains the values to be written to the EQRAM. The address written will have be specified by the EQRAM Address fields.

Register Address	Bit	Label	Type	Default	Description
EQRAM_WRITE[15:8] verb FAA/7AA	7:0	EQWD[15:8]	RW	0x00	48-bit data register, contains the values to be written to the EQRAM. The address written will have be specified by the EQRAM Address fields.

Register Address	Bit	Label	Type	Default	Description
EQRAM_WRITE[7:0] verb FAB/7AB	7:0	EQWD[7:0]	RW	0x00	48-bit data register, contains the values to be written to the EQRAM. The address written will have be specified by the EQRAM Address fields.

7.29.1.26. EQRAM Address Register

This 8-bit register provides the address to the internal RAM when doing indirect writes/reads to the EQRAM.

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will generate a reset for all revisions.

Register Address	Bit	Label	Type	Default	Description
verb FAC/7AC	7:6	RSVD	RO	0x00	Reserved
	5:0	EQADD[5:0]	RW	0x00	Contains the address (between 0x00 and 0x33) of the EQRAM to be accessed by a read or write. This is not a byte address—it is the address of the 48-bit data item to be accessed from the EQRAM.

7.29.1.27. EQRAM Control Register

This control register provides the write/read enable when doing indirect writes/reads to the EQRAM

Prior to WC revision, this register reset by POR/DAFG/ULR. WC revision, reset by POR only. Writing to NID22h verb 77F will generate a reset for all revisions.

Register Address	Bit	Label	Type	Default	Description
verb FAD/7AD	7	EQRAM_wr	RW	0	1 = write to EQRAM, cleared by HW when done
	6	EQRAM_rd	RW	0	1 = read from EQRAM, cleared by HW when done
	5:0	RSVD	RO	0	Reserved

8. PINOUT AND PACKAGING

SINGLE CHIP PC AUDIO SYSTEM, CODEC+SPEAKER AMPLIFIER+CAPLESS HP+LDO

8.0.1. 48QFN Pin Table

Pin Name	Pin Function	I/O	Internal Pull-up/Pull-down	48 pin location
DVDD_CORE	1.5V Digital Core Regulator Filter Cap	O(Digital)	None	1
DMIC_CLK/GPIO1	Digital Mic Clock Output/GPIO1	I/O(Digital)	60K Pull-down	2
DVDD_IO	Reference Voltage (1.5V or 3.3V)	I(Digital)	None	3
DMIC0/GPIO2	Digital Mic 01 Input/GPIO2	I/O(Digital)	60K Pull-down	4
SDATA_OUT	HD Audio Serial Data output from controller	I/O(Digital)	None	5
BITCLK	HD Audio Bit Clock	I(Digital)	None	6
DVSS	Digital Ground	I(Digital)	None	7
SDATA_IN	HD Audio Serial Data Input to controller	O(Digital)	None	8
DVDD	Digital Vdd= 3.3V	I(Digital)	None	9
SYNC	HD Audio Frame Sync	I(Digital)	None	10
RESET#	HD Audio Reset	I(Digital)	None	11
PC_BEEP	PC Beep	I(Analog)	None	12
SENSE_A	Jack insertion detection Ports A,B,C, SPDIFOUT0	I(Analog)	None	13
SENSE_B	Jack insertion detection Ports E,F, DMIC0, SPDIFOUT1 (DMIC1)	I(Analog)	None	14
PORTE_L	Port E Left	I/O(Analog)	None	15
PORTE_R	Port E Right	I/O(Analog)	None	16
PORTF_L	Port F Left	I/O(Analog)	None	17
PORTF_R	Port F Right	I/O(Analog)	None	18
PORTC_L	Port C Left	I/O(Analog)	None	19
PORTC_R	Port C Right	I/O(Analog)	None	20
VREFFILT	Analog Virtual Ground	O(Analog)	None	21
CAP2	Reference filter Cap	O(Analog)	None	22
VREFOUT-A	Reference Voltage out drive (intended for mic bias)	O(Analog)	None	23
VREFOUT-C/GPIO4	Reference Voltage out drive (intended for mic bias) or general purpose I/O	O(Analog)	None	24
Mono_Out	Mono output	O(Analog)	None	25
AVSS1	Analog Ground	I(Analog)	None	26
AVDD1	Analog Vdd=5.0V or 3.3V	I(Analog)	None	27
PORTA_L (HP0)	Port A Output Left	I/O(Analog)	None	28
PORTA_R (HP0)	Port A Output Right	I/O(Analog)	None	29
AVSS	Analog Ground	I(Analog)	None	30
PORTB_L (HP1)	Port B Output Left	I/O(Analog)	None	31
PORTB_R (HP1)	Port B Output Right	I/O(Analog)	None	32
AVSS	Analog Ground	I(Analog)	None	33
V-	Negative analog supply	O(Analog)	None	34

Table 33. 48QFN Pin Description

92HD91

SINGLE CHIP PC AUDIO SYSTEM, CODEC+SPEAKER AMPLIFIER+CAPLESS HP+LDO

Pin Name	Pin Function	I/O	Internal Pull-up/Pull-down	48 pin location
CAP-	Charge pump cap -	O(Analog)	None	35
CAP+	Charge pump cap +	O(Analog)	None	36
VREG	Linear Regulator Output (2.5V) filter cap	O(Analog)	None	37
AVDD2	Analog Supply for VREG	I(Analog)	None	38
PVDD	Analog Supply for Class-D amp	I(Analog)	None	39
PORTD_+L	BTL amp Left +	O(Analog)	None	40
PORTD_-L	BTL amp Left -	O(Analog)	None	41
PVSS	Analog Ground	I(Analog)	None	42
PORTD_-R	BTL amp Right -	O(Analog)	None	43
PORTD_+R	BTL amp Right +	O(Analog)	None	44
PVDD	Analog Supply for Class-D amp	I(Analog)	None	45
DMIC1/GPIO/SPDIFOUT1	Digital Microphone input, SPDIF Output, or GPIO0	I/O(Digital)	60K Pull-down	46
EAPD	EAPD	I/O (Digital)	60K Pull-up	47
SPDIFOUT0/GPIO3	SPDIF0	O(Digital)	60K pull-down	48

Table 33. 48QFN Pin Description

8.0.2. 48QFN Package Outline and Package Dimensions

Package dimensions are kept current with JEDEC Publication No. 95

Figure 23. 48QFN Package Diagram

8.1. Standard Reflow Profile Data

Note: These devices can be hand soldered at 360 °C for 3 to 5 seconds.

FROM: IPC / JEDEC J-STD-020C “Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices” (www.jedec.org/download).

Profile Feature	Pb Free Assembly
Average Ramp-Up Rate ($T_{s_{max}} - T_p$)	3 °C / second max
Preheat: Temperature Min ($T_{s_{min}}$) Temperature Max ($T_{s_{max}}$) Time ($t_{s_{min}} - t_{s_{max}}$)	150 °C 200 °C 60 - 180 seconds
Time maintained above: Temperature (T_L) Time (t_L)	217 °C 60 - 150 seconds
Peak / Classification Temperature (T_p)	See “Package Classification Reflow Temperatures”
Time within 5 °C of actual Peak Temperature (t_p)	20 - 40 seconds
Ramp-Down rate	6 °C / second max
Time 25 °C to Peak Temperature	8 minutes max
Note: All temperatures refer to topside of the package, measured on the package body surface.	

Table 34. Standard Reflow Profile

9. DISCLAIMER

While the information presented herein has been checked for both accuracy and reliability, manufacturer assumes no responsibility for either its use or for the infringement of any patents or other rights of third parties, which would result from its use. No other circuits, patents, or licenses are implied. This product is intended for use in normal commercial applications. Any other applications, such as those requiring extended temperature range, high reliability, or other extraordinary environmental requirements, are not recommended without additional processing by manufacturer. Manufacturer reserves the right to change any circuitry or specifications without notice. Manufacturer does not authorize or warrant any product for use in life support devices or critical medical instruments.

10. DOCUMENT REVISION HISTORY

Revision	Date	Description of Change
0.5	November 2009	Initial release
0.8	March 2010	Added widget details, front page feature bullet updates
0.85	June 2010	Aux mode section added
0.9	September 2010	Added changes for YA silicon revision (ZA/ZB prior settings referenced) AFG EAPD bit added for PortE Headphone control. AFG ComJack bits added to select debounce time. Port E headphone enable bit added. AFG EAPD Aux audio bit added for Port E. Removed SCS support. Updated conditions of performance characteristics, added HDA signalling voltage to condition for power measurements. Default changed on BTL/HD_Mode from 0 to 1. Updated Record Path behavior table for Aux mode. Updated Pin Configuration Default Settings. Corrected Combo Jack diagram.
0.91	October 2010	Updated LDO Level Control values. Corrected step size and thermal trip in BTL section. Updated SPKVOL L/R step size to .75dB. Added additional verb for updating speaker L and R volume at the same time (to match HDA implementation). Widget 22h verbs added/reordered. Clarified AuxMode section wording related to D3Cold entry. Added description text for High pass and Mono band pass filter features.
0.92	May 2011	Corrected Sense A/B description and table.
0.93	June 2011	Corrected front page bullet for BTL voltage.
1.0	October 2011	Corrected Left vs Right channel for the EQ coefficients to match silicon. Updated electrical characteristics for typical values. Removed Preliminary. Removed comments related to ZA and ZB silicon since they were non-production. Added WB silicon widget items: ComboJackTiming in the AFG and ScStableTimeSel added to AFG AnaBTL. Added PVDD value for the digital maximum supply voltage and footnote to the GPIO characteristics for the Input Low and High Voltage. Added missing EAPD widget details.
1.1	November 2011	Added feature bullet and description section for microphone input mute which is available only on silicon revisions WB and beyond.
1.2	January 2012	Corrections for 022FB0 / 0227B0 to 022FB6 / 0227B6 as they are not reachable via NID22 but must be accessed through the Port Nodes. Updated NID22 registers with reset information, which is different for WC silicon revision.
1.3	March 2012	Added ComboJackTime widget and EAPD widget details.
1.4	June 2012	Added THD+N setting to Class D Output power and 3W typical line.
1.5	February 2013	Added Industrial temp package option for revisions WC and beyond.
1.6	September 2014	Released in TSI Format
