

FEATURES

44 V supply maximum ratings

V_{SS} to V_{DD} analog signal range

Low on resistance (45 Ω max)

Low ΔR_{ON} (5 Ω max)

Low R_{ON} match (4 Ω max)

Low power dissipation

Fast switching times

$t_{ON} < 175$ ns

$t_{OFF} < 145$ ns

Low leakage currents (5 nA max)

Low charge injection (10 pC max)

Break-before-make switching action

APPLICATIONS

Audio and video switching

Battery-powered systems

Test equipment

Communication systems

GENERAL DESCRIPTION

The **ADG333A** is a monolithic complementary metal-oxide semiconductor (CMOS) device comprising four independently selectable single-pole, double-throw (SPDT) switches. It is designed on a linear compatible CMOS (LC²MOS) process, which provides low power dissipation yet achieves a high switching speed and a low on resistance.

The on-resistance profile is very flat over the full analog input range, ensuring good linearity and low distortion when switching audio signals. High switching speed also makes the device suitable for video signal switching. CMOS construction ensures ultralow power dissipation, making the device ideally suited for portable, battery-powered instruments.

When they are on, each switch conducts equally well in both directions and has an input signal range that extends to the power supplies. In the off condition, signal levels up to the supplies are blocked. All switches exhibit break-before-make switching action for use in multiplexer applications. Low charge injection is inherent in the design.

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

PRODUCT HIGHLIGHTS

1. Extended signal range. The **ADG333A** is fabricated on an enhanced LC²MOS process, giving an increased signal range which extends to the supply rails.
2. Low power dissipation.
3. Low R_{ON} .
4. Single-supply operation. For applications in which the analog signal is unipolar, the **ADG333A** can be operated from a single rail power supply. The device is fully specified with a single 12 V supply.

¹ Overvoltage at IN, S, or D is clamped by internal diodes. Current should be limited to the maximum ratings given.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

TERMINOLOGY

 R_{ON}

Ohmic resistance between D and S.

 ΔR_{ON}

R_{ON} variation due to a change in the analog input voltage with a constant load current.

 R_{ON} Match

Difference between the R_{ON} of any two channels.

 I_S (OFF)

Source leakage current with the switch off.

 I_D (OFF)

Drain leakage current with the switch off.

 I_D, I_S (ON)

Channel leakage current with the switch on.

 V_D (V_S)

Analog voltage on Terminal D and Terminal S.

 C_S (OFF)

Off switch source capacitance.

 C_D (OFF)

Off switch drain capacitance.

 C_D, C_S (ON)

On switch capacitance.

 t_{ON}

Delay between applying the digital control input and the output switching on.

 t_{OFF}

Delay between applying the digital control input and the output switching off.

 t_{OPEN}

Break-before-make delay when switches are configured as a multiplexer.

 V_{INL}

Maximum input voltage for Logic 0.

 V_{INH}

Minimum input voltage for Logic 1.

 I_{INL} (I_{INH})

Input current of the digital input.

Crosstalk

A measure of unwanted signal which is coupled through from one channel to another as a result of parasitic capacitance.

Off Isolation

A measure of unwanted signal coupling through an off switch.

Charge Injection

A measure of the glitch impulse transferred from the digital input to the analog output during switching.

APPLICATIONS INFORMATION

ADG333A SUPPLY VOLTAGES

The ADG333A can operate from a dual or signal supply. V_{SS} should be connected to GND when operating with a single supply.

When using a dual supply, the ADG333A can also operate with unbalanced supplies; for example $V_{DD} = 20\text{ V}$ and $V_{SS} = -5\text{ V}$.

The only restrictions are that V_{DD} to GND must not exceed 30 V, V_{SS} to GND must not drop below -30 V , and V_{DD} to V_{SS} must not exceed +44 V. It is important to remember that the ADG333A supply voltage directly affects the input signal range, the switch on resistance and the switching times of the device.

The effects of the power supplies on these characteristics can be clearly seen from the Typical Performance Characteristics curves.

POWER SUPPLY SEQUENCING

When using CMOS devices, care must be taken to ensure correct power-supply sequencing. Incorrect power-supply sequencing can result in the device being subjected to stresses beyond those listed in the Absolute Maximum Ratings. This is also true for the ADG333A. Always turn on V_{DD} first, followed by V_{SS} and the logic signals. An external signal within the maximum specified ratings can then be safely presented to the source or drain of the switch.
