

AS1310

Ultra Low Quiescent Current, Hysteretic DC-DC Step-Up Converter

General Description

The AS1310 is an ultra low quiescent current hysteretic step-up DC-DC converter optimized for light loads (60mA), where it achieves efficiencies of up to 92%.

AS1310 operates from a 0.7V to 3.6V supply and supports output voltages between 1.8V and 3.3V. Besides the available AS1310 standard variants any variant with output voltages in 50mV steps are available.

If the input voltage exceeds the output voltage the device is in a feed-through mode and the input is directly connected to the output voltage.

In light load operation, the device enters a sleep mode when most of the internal operating blocks are turned OFF in order to save power. This mode is active approximately 50µs after a current pulse provided that the output is in regulation.

In order to save power the AS1310 features a shutdown mode, where it draws less than 100nA. During shutdown mode the battery is disconnected from the output.

The AS1310 also offers adjustable low battery detection. If the battery voltage decreases below the threshold defined by two external resistors on pin LBI, the LBO output is pulled to logic low.

The AS1310 is available in a TDFN (2x2) 8-pin package.

[Ordering Information](#) and [Content Guide](#) appear at end of datasheet.

Key Benefits & Features

The benefits and features of AS1310, Ultra Low Quiescent Current, Hysteretic DC-DC Step-Up Converter are listed below:

Figure 1:
Added Value of Using AS1310

Benefits	Features
Ideal for single Li-Ion battery powered applications	• Wide Input Voltage Range (0.7V to 3.6V) • Feed through mode when $V_{IN} > V_{OUT}$
Extended battery life	• High Efficiency up to 92% • Low Quiescent Current of typ. 1µA • Low Shutdown Current of less than 100nA
Supports a variety of end applications	• Fixed output voltage range (1.8V to 3.3V) • Output Disconnect in shutdown • Output current: 60mA @ $V_{IN}=0.9V$, $V_{OUT}=1.8V$

Benefits	Features
Over – temperature protection and shutdown	Integrated temperature monitoring
Early power-fail warning	Adjustable low battery detection
Cost effective, small package	- No external diode or transistor required 8-pin TDFN (2mm x 2mm)

Applications

The AS1310 is an ideal solution for single and dual cell powered devices as blood glucose meters, remote controls, hearing aids, wireless mouse or any light-load application.

Pin Assignment

Figure 3:
Pin Diagram (Top View)

Figure 4:
Pin Description

Pin Number	Pin Name	Description
1	LBI	Low Battery Comparator Input. 0.6V Threshold. May not be left floating. If connected to GND, LBO is working as Power Output OK.
2	GND	Ground
3	LX	External Inductor Connector
4	V_{OUT}	Output Voltage. Decouple V_{OUT} with a ceramic capacitor as close as possible to V_{OUT} and GND .
5	REF	Reference Pin. Connect a 100nF ceramic capacitor to this pin.
6	LBO	Low Battery Comparator Output. Open-drain output.
7	EN	Enable Pin. Logic controlled shutdown input. 1 = Normal operation; 0 = Shutdown; shutdown current <100nA.
8	V_{IN}	Battery Voltage Input. Decouple V_{IN} with a 22 μ F ceramic capacitor as close as possible to V_{IN} and GND.
9	NC	Exposed Pad. This pad is not connected internally. Can be left floating or connect to GND to achieve an optimal thermal performance.

Absolute Maximum Ratings

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in Electrical Characteristics is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Figure 5:

Note(s) and/or Footnote(s):

- The regulator is in startup mode until this voltage is reached. Caution: Do not apply full load current until the device output $> 1.75V$.
- LBO goes low in startup mode as well as during normal operation if:
 - The voltage at the LBI pin is below LBI threshold.
 - The voltage at the LBI pin is below $0.1V$ and V_{OUT} is below 92.5% of its nominal value.

Detailed Description

Hysteretic Boost Converter

Hysteretic boost converters are so called because comparators are the active elements used to determine ON-OFF timing via current and voltage measurements. There is no continuously operating fixed oscillator, providing an independent timing reference. As a result, a hysteretic or comparator based converter has a very low quiescent current. In addition, because there is no fixed timing reference, the operating frequency is determined by external component (inductor and capacitors) and also the loading on the output.

Ripple at the output is an essential operating component. A power cycle is initiated when the output regulated voltage drops below the nominal value of V_{OUT} ($0.99 \times V_{OUT}$).

Inductor current is monitored by the control loop, ensuring that operation is always dis-continuous.

The application circuit shown in [Figure 2](#) will support many requirements. However, further optimization may be useful, and the following is offered as a guide to changing the passive components to more closely match the end requirement.

Input Loop Timing

The input loop consists of the source DC supply, the input capacitor, the main inductor, and the N-channel power switch. The ON timing of the N-channel switch is determined by a peak current measurement or a maximum ON time. In the AS1310, peak current is 400mA (typ) and maximum ON time is 4.2μs (typ). Peak current measurement ensures that the ON time varies as the input voltage varies. This imparts line regulation to the converter.

The fixed ON-time measurement is something of a safety feature to ensure that the power switch is never permanently ON. The fixed on-time is independent of input voltage changes. As a result, no line regulation exists.

Figure 16:
Simplified Boost DCDC Architecture

ON time of the power switch (Faraday's Law) is given by:

$$(EQ1) \quad T_{ON} = \frac{L I_{PK}}{V_{IN} - (I_{PK} R_{SW1} + I_{PK} R_{L1})} \text{ sec [volts, amps, ohms, Henry]}$$

Applying Min and Max values and neglecting the resistive voltage drop across L1 and SW1;

$$(EQ2) \quad T_{ON_MIN} = \frac{L_{MIN} I_{PK_MIN}}{V_{IN_MAX}}$$

$$(EQ3) \quad T_{ON_MAX} = \frac{L_{MAX} I_{PK_MAX}}{V_{IN_MIN}}$$

Figure 17:
Simplified Voltage and Current Waveforms

Another important relationship is the “volt-seconds” law.
Expressed as following:

$$(EQ4) \quad V_{ON}T_{ON} = V_{OFF}T_{OFF}$$

Voltages are those measured across the inductor during each time segment. Figure 17 shows this graphically with the shaded segments marked “A & B”. Re-arranging EQ 4:

$$(EQ5) \quad \frac{T_{ON}}{T_{OFF}} = \frac{V_{OUT} - V_{IN}}{V_{IN}}$$

The time segment called T_{WAIT} in Figure 17 is a measure of the “hold-up” time of the output capacitor. While the output voltage is above the threshold ($0.99 \times V_{OUT}$), the output is assumed to be in regulation and no further switching occurs.

Inductor Choice Example

For the AS1310 $V_{IN_MIN} = 0.9V$, $V_{OUT_MAX} = 3.3V$, [EQ 5](#) gives $T_{ON} = 2.66T_{OFF}$.

Let the maximum operating on-time = $1\mu s$.

Note that this is shorter than the minimum limit ON-time of $3.6\mu s$. Therefore from [EQ 5](#), $T_{OFF} = 0.376\mu s$. Using [EQ 3](#), L_{MAX} is obtained:

$L_{MAX} = 1.875\mu H$. The nearest preferred value is $2.2\mu H$.

This value provides the maximum energy storage for the chosen fixed ON-time limit at the minimum V_{IN} .

Energy stored during the ON time is given by:

$$(EQ6) \quad E = 0.5L(I_{PK})^2 \text{ Joules (Region A in Figure 17)}$$

If the overall time period ($T_{ON} + T_{OFF}$) is T , the power taken from the input is:

$$(EQ7) \quad P_{IN} = \frac{0.5L(I_{PK})^2}{T} \text{ Watts}$$

Assume output power is $0.8 P_{IN}$ to establish an initial value of operating period T .

T_{WAIT} is determined by the time taken for the output voltage to fall to $0.99V_{OUT}$. The longer the wait time, the lower will be the supply current of the converter. Longer wait times require increased output capacitance. Choose $T_{WAIT} = 10\% T$ as a minimum starting point for maximum energy transfer. For very low power load applications, choose $T_{WAIT} \geq 50\% T$.

Output Loop Timing

The output loop consists of the main inductor, P-channel synchronous switch (or diode if fitted), output capacitor and load. When the input loop is interrupted, the voltage on the LX pin rises (Lenz's Law). At the same time a comparator enables the synchronous switch, and energy stored in the inductor is transferred to the output capacitor and load. Inductor peak current supports the load and replenishes the charge lost from the output capacitor. The magnitude of the current from the inductor is monitored, and as it approaches zero, the synchronous switch is turned ON. No switching action continues until the output voltage falls below the output reference point ($0.99 \times V_{OUT}$).

Output power is composed of the DC component (Region C in [Figure 17](#)):

$$(EQ8) \quad P_{REGION_C} = V_{IN} \frac{I_{PK} T_{OFF}}{2 T}$$

Output power is also composed of the inductor component (Region B in [Figure 17](#)), neglecting efficiency loss:

$$(EQ9) \quad P_{REGION_B} = \frac{0.5L(I_{PK})^2}{T}$$

Total power delivered to the load is the sum of EQ 8 and EQ 9:

$$(EQ10) \quad P_{TOTAL} = V_{IN} \frac{I_{PK} T_{OFF}}{2T} + \frac{0.5L(I_{PK})^2}{T}$$

From EQ 3 (using nominal values) peak current is given by:

$$(EQ11) \quad I_{PK} = \frac{T_{ON} V_{IN}}{L}$$

Substituting EQ 11 into EQ 10 and re-arranging:

$$(EQ12) \quad P_{TOTAL} = \frac{V_{IN}^2 T_{ON}}{2TL} (0.9T)$$

0.9T incorporates a wait time $T_{WAIT} = 10\% T$

Output power in terms of regulated output voltage and load resistance is:

$$(EQ13) \quad P_{OUT} = \frac{V_{OUT}^2}{R_{LOAD}}$$

Combining EQ 12 and EQ 13:

$$(EQ14) \quad \frac{V_{OUT}^2}{R_{LOAD}} = \frac{V_{IN}^2 T_{ON}}{2TL} (0.9T) \eta$$

Symbol η reflects total energy loss between input and output and is approximately 0.8 for these calculations. Use EQ 14 to plot duty cycle (T_{ON}/T) changes for various output loadings and changes to V_{IN} .

Input Capacitor Selection

The input capacitor supports the triangular current during the ON-time of the power switch, and maintains a broadly constant input voltage during this time. The capacitance value is obtained from choosing a ripple voltage during the ON-time of the power switch. Additionally, ripple voltage is generated by the equivalent series resistance (ESR) of the capacitor. For worst case, use maximum peak current values from the datasheet.

$$(EQ15) \quad C_{IN} = \frac{I_{PEAK} T_{ON}}{V_{RIPPLE}}$$

Using $T_{ON} = 1\mu s$, and $I_{PEAK} = 480mA$, and $V_{RIPPLE} = 50mV$, EQ 15 yields:

$$C_{IN} = 9.6\mu F$$

Nearest preferred would be $10\mu F$.

$$(EQ16) \quad V_{PK_RIPPLE_ESR} = I_{PK} R_{ESR}$$

Typically, the ripple due to ESR is not dominant. ESR for the recommended capacitors (Murata GMR), ESR = 5mΩ to 10mΩ. For the AS1310, maximum peak current is 480mA. Ripple due to ESR is 2.4mV to 4.8mV.

Ripple at the input propagates through the common supply connections, and if too high in value can cause problems elsewhere in the system. The input capacitance is an important component to get right.

Output Capacitor Selection

The output capacitor supports the triangular current during the OFF-time of the power switch (inductor discharge period), and also the load current during the wait time (Region D in [Figure 17](#)) and ON-time (Region A in [Figure 17](#)) of the power switch.

$$(EQ17) \quad C_{OUT} = \frac{I_{LOAD}(T_{ON} + T_{WAIT})}{(1 - 0.99)V_{OUT_NOM}}$$

Note(s): There is also a ripple component due to the equivalent series resistance (ESR) of the capacitor.

Summary

User Application Defines:

V_{INmin} , V_{INmax} , V_{OUTmin} , V_{OUTmax} , $I_{LOADmin}$, $I_{LOADmax}$

Inductor Selection:

Select Max on-time = 0.5μs to 3μs for AS1310. Use [EQ 3](#) to calculate inductor value.

Use [EQ 5](#) to determine OFF-time.

Use [EQ 6](#) to check that power delivery matches load requirements assume 70% conversion efficiency.

Use [EQ 13](#) to find overall timing period value of T at min V_{IN} and max V_{OUT} for maximum load conditions.

Input Capacitor Selection:

Choose a ripple value and use [EQ 14](#) to find the value.

Output Capacitor Selection:

Determine T_{WAIT} via [EQ 6](#) or [EQ 13](#), and use [EQ 16](#) to find the value.

Application Information

The AS1310 is available with fixed output voltages from 1.8V to 3.3V in 50mV steps.

Figure 18:
AS1310 Block Diagram

AS1310 Features

Shutdown. The part is in shutdown mode while the voltage at pin EN is below 0.1V and is active when the voltage is higher than 0.7V.

Note(s): EN can be driven above V_{IN} or V_{OUT} , as long as it is limited to less than 3.6V.

Output Disconnect and Inrush Limiting. During shutdown V_{OUT} is going to 0V and no current from the input source is running through the device. This is true as long as the input voltage is higher than the output voltage.

Feedthrough Mode. If the input voltage is higher than the output voltage the supply voltage is connected to the load through the device. To guarantee a proper function of the AS1310 it is not allowed that the supply exceeds the maximum allowed input voltage (3.6V).

In this feedthrough mode the quiescent current is 35μA (typ.). The device goes back into step-up mode when the output voltage is 4% (typ.) below V_{OUTNOM} .

Power-OK and Low-Battery-Detect Functionality

LBO goes low in startup mode as well as during normal operation if:

- The voltage at the LBI pin is below LBI threshold (0.6V). This can be used to monitor the battery voltage.
- LBI pin is connected to GND and V_{OUT} is below 92.5% of its nominal value. LBO works as a power-OK signal in this case.

The LBI pin can be connected to a resistive-divider to monitor a particular definable voltage and compare it with a 0.6V internal reference. If LBI is connected to GND an internal resistive-divider is activated and connected to the output. Therefore, the Power-OK functionality can be realized with no additional external components.

The Power-OK feature is not active during shutdown and provides a power-ON-reset function that can operate down to $V_{IN} = 0.7V$. A capacitor to GND may be added to generate a power-ON-reset delay. To obtain a logic-level output, connect a pull-up resistor R_3 from pin LBO to pin V_{OUT} . Larger values for this resistor will help to minimize current consumption; a 100k Ω resistor is perfect for most applications (see Figure 20).

For the circuit shown in the left of Figure 19, the input bias current into LBI is very low, permitting large-value resistor-divider networks while maintaining accuracy. Place the resistor-divider network as close to the device as possible. Use a defined resistor for R_2 and then calculate R_1 as:

$$(EQ18) \quad R_1 = R_2 \cdot \left(\frac{V_{IN}}{V_{LBI}} - 1 \right)$$

Where: V_{LBI} is 0.6V $\pm$ 30mV

Figure 19:
Typical Application with Adjustable Battery Monitoring

Figure 20:
Typical Application with LBO working as Power-OK

Thermal Shutdown

To prevent the AS1310 from short-term misuse and overload conditions the chip includes a thermal overload protection. To block the normal operation mode all switches will be turned OFF. The device is in thermal shutdown when the junction temperature exceeds 150°C. To resume the normal operation the temperature has to drop below 140°C.

A good thermal path has to be provided to dissipate the heat generated within the package. Otherwise it's not possible to operate the AS1310 at its usable maximal power. To dissipate as much heat as possible from the package into a copper plane with as much area as possible, it's recommended to use multiple vias in the printed circuit board. It's also recommended to solder the Exposed Pad (pin 9) to the GND plane.

Note(s): Continuing operation in thermal overload conditions may damage the device and is considered bad practice.

Always ON Operation

In battery powered applications with long standby times as blood glucose meters, remote controls, soap dispensers, etc., a careful battery management is required. Normally a complex power management control makes sure that the DCDC is only switched ON, when it is really needed. With AS1310 this complex control can be saved completely, since the AS1310 is perfectly suited to support always-ON operations of the application. The efficiency at standby currents of e.g. 2µAs is around 45% (see Figure 21).

Figure 21:
Efficiency vs. Output Current for Always ON Operation;
 $V_{OUT}=3.3V$

Component Selection

Only four components are required to complete the design of the step-up converter. The low peak currents of the AS1310 allow the use of low value, low profile inductors and tiny external ceramic capacitors.

Inductor Selection

For best efficiency, choose an inductor with high frequency core material, such as ferrite, to reduce core losses. The inductor should have low DCR (DC resistance) to reduce the I^2R losses, and must be able to handle the peak inductor current without saturating. A 6.8μH inductor with a >500mA current rating and <500mΩ DCR is recommended.

Figure 22:
Recommended Inductors

Part Number	L	DCR	Current Rating	Dimensions (L/W/T)	Manufacturer
XPL2010-682M	6.8μH	421mΩ	0.62A	2.0x1.9x1.0 mm	Coilcraft www.coilcraft.com
EPL2014-682M	6.8μH	287mΩ	0.59A	2.0x2.0x1.4 mm

LQH44PN6R8MJ0L	6.8μH	143mΩ	0.72A	4.0x4.0x1.1 mm	

Capacitor Selection

The convertor requires three capacitors. Ceramic X5R or X7R types will minimize ESL and ESR while maintaining capacitance at rated voltage over temperature. The V_{IN} capacitor should be 22 μ F. The V_{OUT} capacitor should be between 22 μ F and 47 μ F. A larger output capacitor should be used if lower peak to peak output voltage ripple is desired. A larger output capacitor will also improve load regulation on V_{OUT} . See Figure 23 for a list of capacitors for input and output capacitor selection.

Figure 23:
Recommended Input and Output Capacitors

Part Number	C	TC Code	Rated Voltage	Dimensions (L/W/T)	Manufacturer
GRM21BR60J226ME99	22 μ F	X5R	6.3V	0805, T=1.25mm	Murata www.murata.com

Layout Considerations

Relatively high peak currents of 480mA (max) circulate during normal operation of the AS1310. Long printed circuit tracks can generate additional ripple and noise that mask correct operation and prove difficult to “de-bug” during production testing. Referring to Figure 2, the input loop formed by C1, V_{IN} and GND pins should be minimized. Similarly, the output loop formed by C2, V_{OUT} and GND should also be minimized. Ideally both loops should connect to GND in a “star” fashion. Finally, it is important to return C_{REF} to the GND pin directly.

Package Drawings & Markings

The device is available in a TDFN (2x2) 8-pin package.

Figure 25:
Drawings and Dimensions

Note(s) and/or Footnote(s):

1. Dimensioning & tolerancing conform to *ASME Y14.5M-1994*.
2. All dimensions are in millimeters. Angles are in degrees.
3. Coplanarity applies to the exposed heat slug as well as the terminal.
4. Radius on terminal is optional.
5. N is the total number of terminals.

Ordering & Contact Information

The device is available as the standard products shown in Figure 26.

Figure 26:
Ordering Information

Ordering Code	Marking	Output	Description	Delivery Form	Package
AS1310-BTDT-18	A2	1.8V	Ultra Low Quiescent Current, Hysteretic DC-DC Step-Up Converter	Tape and Reel	TDFN (2x2) 8-pin
AS1310-BTDT-20	A8	2.0V		Tape and Reel	TDFN (2x2) 8-pin

RoHS Compliant & ams Green Statement

RoHS: The term RoHS compliant means that ams AG products fully comply with current RoHS directives. Our semiconductor products do not contain any chemicals for all 6 substance categories, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, RoHS compliant products are suitable for use in specified lead-free processes.

ams Green (RoHS compliant and no Sb/Br): ams Green defines that in addition to RoHS compliance, our products are free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material).

Important Information: The information provided in this statement represents ams AG knowledge and belief as of the date that it is provided. ams AG bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. ams AG has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. ams AG and ams AG suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

Copyrights & Disclaimer

Copyright ams AG, Tobelbader Strasse 30, 8141 Unterpremstaetten, Austria-Europe. Trademarks Registered. All rights reserved. The material herein may not be reproduced, adapted, merged, translated, stored, or used without the prior written consent of the copyright owner.

Devices sold by ams AG are covered by the warranty and patent indemnification provisions appearing in its General Terms of Trade. ams AG makes no warranty, express, statutory, implied, or by description regarding the information set forth herein. ams AG reserves the right to change specifications and prices at any time and without notice. Therefore, prior to designing this product into a system, it is necessary to check with ams AG for current information. This product is intended for use in commercial applications. Applications requiring extended temperature range, unusual environmental requirements, or high reliability applications, such as military, medical life-support or life-sustaining equipment are specifically not recommended without additional processing by ams AG for each application. This product is provided by ams AG "AS IS" and any express or implied warranties, including, but not limited to the implied warranties of merchantability and fitness for a particular purpose are disclaimed.

ams AG shall not be liable to recipient or any third party for any damages, including but not limited to personal injury, property damage, loss of profits, loss of use, interruption of business or indirect, special, incidental or consequential damages, of any kind, in connection with or arising out of the furnishing, performance or use of the technical data herein. No obligation or liability to recipient or any third party shall arise or flow out of ams AG rendering of technical or other services.

Document Status

Document Status	Product Status	Definition
Product Preview	Pre-Development	Information in this datasheet is based on product ideas in the planning phase of development. All specifications are design goals without any warranty and are subject to change without notice
Preliminary Datasheet	Pre-Production	Information in this datasheet is based on products in the design, validation or qualification phase of development. The performance and parameters shown in this document are preliminary without any warranty and are subject to change without notice
Datasheet	Production	Information in this datasheet is based on products in ramp-up to full production or full production which conform to specifications in accordance with the terms of ams AG standard warranty as given in the General Terms of Trade
Datasheet (discontinued)	Discontinued	Information in this datasheet is based on products which conform to specifications in accordance with the terms of ams AG standard warranty as given in the General Terms of Trade, but these products have been superseded and should not be used for new designs

Revision Information

Changes from 1-10 (2014-Nov-11) to current revision 1-11 (2015-Jan-28)	Page
Updated Figure 18	18
Updated Figures 19 & 20	20

Note(s) and/or Footnote(s):

1. Page and figure numbers for the previous version may differ from page and figure numbers in the current revision.
2. Correction of typographical errors is not explicitly mentioned.

Content Guide

1	General Description
1	Key Benefits & Features
2	Applications
3	Pin Assignment
4	Absolute Maximum Ratings
5	Electrical Characteristics
7	Typical Operating Characteristics
12	Detailed Description
12	Hysteretic Boost Converter
12	Input Loop Timing
15	Inductor Choice Example
15	Output Loop Timing
16	Input Capacitor Selection
17	Output Capacitor Selection
17	Summary
18	Application Information
18	AS1310 Features
19	Power-OK and Low-Battery-Detect Functionality
21	Thermal Shutdown
21	Always ON Operation
22	Component Selection
22	Inductor Selection
23	Capacitor Selection
23	Layout Considerations
24	Package Drawings & Markings
25	Ordering & Contact Information
26	RoHS Compliant & ams Green Statement
27	Copyrights & Disclaimer
28	Document Status
29	Revision Information
