

1:4 LVPECL Fanout Buffer with Selectable Clock Input

Features

- Select one of two differential (LVPECL, LVDS, HCSL, or CML) input pairs to distribute to four LVPECL output pairs
- Translates any single-ended input signal to 3.3 V LVPECL levels with resistor bias on INx# input
- 30 ps maximum output-to-output skew
- 480 ps maximum propagation delay
- 0.15 ps maximum additive RMS phase jitter at 156.25 MHz (12 kHz to 20 MHz offset)
- Up to 1.5 GHz operation
- Synchronous clock enable function
- 20-pin TSSOP
- 2.5 V or 3.3 V operating voltage ^[1]
- Commercial and industrial operating temperature range

Functional Description

The CY2DP1504 is an ultra-low noise, low-skew, low-propagation delay, 1:4 LVPECL fanout buffer targeted to meet the requirements of high-speed clock distribution applications. The CY2DP1504 can select between separate differential (LVPECL, LVDS, HCSL, or CML) input clock pairs using the IN_SEL pin. The synchronous clock enable function ensures glitch-free output transitions during enable and disable periods. The device has a fully differential internal architecture that is optimized to achieve low additive jitter and low skew at operating frequencies of up to 1.5 GHz.

Notes

- V_{ID} minimum of 400 mV is required to meet all output AC Electrical Specifications. The device is functional with V_{ID} minimum of greater than 200 mV.
- Positive current flows into the input pin, negative current flows out of the input pin.
- Refer to [Figure 3 on page 8](#).
- These parameters are guaranteed by design and are not tested.

Application Information

CY2DP1504 can be used with a single-ended CMOS input by biasing the Complementary Input Clock (INx#). “True” input pins (INx) of differential input pair can be fed with a single-ended CMOS input signal. The “complementary” input pin (INx#) of the same differential input pair can be biased with Vref.

Figure 10 shows the schematic which can be used to give single-ended CMOS input to the CY2DP1504.

The reference voltage $V_{ref} = VDD/2$ is generated by the bias resistors R1, R2 and capacitor C0. This bias circuit should be located as close as possible to the input pin. The ratio of R1 and R2 might need to be adjusted to position the Vref in the center of the input voltage swing. For example, if the input clock swing is 2.5 V and $VDD = 3.3$ V, V_{ref} should be 1.25 V and $R2/R1 = 0.609$.
