## FAN53555

# 5 A, 2.4 MHz, Digitally Programmable TinyBuck® Regulator

## Features

- Fixed-Frequency Operation: 2.4 MHz
- Best-in-Class Load Transient
- Continuous Output Current Capability: 5 A
- Pulse Current Capability: 6.5 A (05 Option)
- 2.5 V to 5.5 V Input Voltage Range
- Digitally Programmable Output Voltage:
  - 00/01/03/05/08/18 Options: 0.6-1.23 V in 10 mV Steps
  - 04/042/09/ Options: 0.603-1.411 V in 12.826 mV Steps
  - 23 Option: 0.60-1.3875 V in 12.5 mV Steps
  - 24 Option: 0.603-1.420 V in 12.967 mV Steps
  - 13 Option: 0.8-1.43 V in 10 mV Steps
- Programmable Slew Rate for Voltage Transitions
- I<sup>2</sup>C-Compatible Interface Up to 3.4 Mbps
- PFM Mode for High Efficiency in Light Load
- Quiescent Current in PFM Mode: 60  $\mu$ A (Typical)
- Internal Soft-Start
- Input Under-Voltage Lockout (UVLO)
- Thermal Shutdown and Overload Protection
- 20-Bump Wafer-Level Chip Scale Package (WLCSP)

## Applications

- Application, Graphic, and DSP Processors
  - ARM™, Krait™, OMAP™, NovaThor™, ARMADA™
- Hard Disk Drives
- Tablets, Netbooks, Ultra-Mobile PCs
- Smart Phones
- Gaming Devices

## Description

The FAN53555 is a step-down switching voltage regulator that delivers a digitally programmable output from an input voltage supply of 2.5 V to 5.5 V. The output voltage is programmed through an I<sup>2</sup>C interface capable of operating up to 3.4 MHz.

Using a proprietary architecture with synchronous rectification, the FAN53555 is capable of delivering 5 A continuous at over 80% efficiency, while maintaining over 80% efficiency at load currents as low as 10 mA. Pulse currents as high as 6.5 A can be supported by the 05 option. The regulator operates at a nominal fixed frequency of 2.4 MHz, which reduces the value of the external components to 330 nH for the output induction and as low as 20  $\mu$ F for the output capacitor. Additional output capacitance can be added to improve regulation during load transients without affecting stability. Inductance up to 1.2  $\mu$ H may be used with additional output capacitance.

At moderate and light loads, Pulse Frequency Modulation (PFM) is used to operate in Power-Save Mode with a typical quiescent current of 60  $\mu$ A. Even with such a low quiescent current, the part exhibits excellent transient response during large load swings. At higher loads, the system automatically switches to fixed-frequency control, operating at 2.4 MHz. In Shutdown Mode, the supply current drops below 1  $\mu$ A, reducing power consumption. PFM Mode can be disabled if constant frequency is desired. The FAN53555 is available in a 20-bump, 1.6 x 2 mm, WLCSP.

TDK	VLC5020T-R47M	470	15.0	5.4	5.0	5.0	2.0

**Notes:**

- I<sub>MAXDC</sub> is the lesser current to produce 40°C temperature rise or 30% inductance roll-off.
- Preferred inductor value is 330 nH and all dynamic characterization was performed with this coil.

**FAN53555-24, -08, and -09 Reduced Output Current (4 A Max. RMS. for 08, and 24, 3 A Max. RMS for 09) Smaller Footprint Application**

The FAN53555-24, -08, and -09 were developed to provide power for core processors with high-performance graphics acceleration in Li-Ion-powered handheld devices. These applications require a very compact solution. The smaller input and output capacitors in the table below assume that additional bypass capacitance exists across the battery in fairly close proximity to the regulator(s). The C<sub>IN</sub> capacitors specified below are the capacitors that are required in very close proximity to VIN and PGND (see *layout recommendations in Figure 2 below*).

**Table 3. Recommended External Components for Lower-Current Applications with FAN53555-08-09-24**

Component	Description	Vendor	Parameter	Typ.	Unit

## Pin Configuration

Figure 3. Top View

A1 = VSEL for 00, 01, 04, 05, 08, 09, 13, 18, 23, 24

A1 = PGOOD for 03

Figure 4. Bottom View

## Pin Definitions

Pin #	Name	Description
A1	VSEL (Except - 03 Option)	<b>Voltage Select.</b> When this pin is LOW, V <sub>OUT</sub> is set by the VSEL0 register. When this pin is HIGH, V <sub>OUT</sub> is set by the VSEL1 register.
	PGOOD (03)	<b>Power Good.</b> This open-drain pin pulls LOW if an overload condition occurs or soft-start is in progress.
A2	EN	<b>Enable.</b> The device is in Shutdown Mode when this pin is LOW. All register values are kept during shutdown. Options 00, 01, 03, 05, 08 09, 13, 18, and 23 do not reset register values when EN is raised. The 04, 24, and 042 options reset all registers to default values when EN pin is LOW. If pulled up to a low-impedance voltage source greater than 1.8 V, use at least 100 $\Omega$ series resistor.
A3	SCL	<b>I<sup>2</sup>C Serial Clock</b>
A4	VOUT	<b>VOUT.</b> Sense pin for V <sub>OUT</sub> . Connect to C <sub>OUT</sub> .
B1	SDA	<b>I<sup>2</sup>C Serial Data</b>
B2, B3, C1 – C4	GND	<b>Ground.</b> Low-side MOSFET is referenced to this pin. C <sub>IN</sub> and C <sub>OUT</sub> should be returned with a minimal path to these pins.
B4	AGND	<b>Analog Ground.</b> All signals are referenced to this pin. Avoid routing high dV/dt AC currents through this pin.
D1, D2, E1, E2	VIN	<b>Power Input Voltage.</b> Connect to the input power source. Connect to C <sub>IN</sub> with minimal path.
D3, D4, E3, E4	SW	<b>Switching Node.</b> Connect to the inductor.

## Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter		Min.	Max.	Unit
$V_{IN}$	Voltage on SW, $V_{IN}$ Pins	IC Not Switching	-0.3	7.0	V
		IC Switching	-0.3	6.5	
	Voltage on EN Pin	Tied without Series Resistance <sup>6)</sup>	-0.3	2.0	V
		Tied through Series Resistance of at Least 100 $\Omega$	-0.3	$V_{IN}^{(6)}$	
Voltage on All Other Pins		IC Not Switching	-0.3	$V_{IN}^{(6)}$	V
$V_{OUT}$	Voltage on $V_{OUT}$ Pin		-0.3	3.0	V
$V_{INOV\_SLEW}$	Maximum Slew Rate of $V_{IN} > 6.5$ V, PWM Switching			100	V/ms
ESD	Electrostatic Discharge Protection Level	Human Body Model per JESD22-A114		2000	V
		Charged Device Model per JESD22-C101		1500	
$T_J$	Junction Temperature		-40	+150	°C
$T_{STG}$	Storage Temperature		-65	+150	°C
$T_L$	Lead Soldering Temperature, 10 Seconds			+260	°C

**Note:**

6. Lesser of 7 V or  $V_{IN}+0.3$  V.

## Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to Absolute Maximum Ratings.

Symbol	Parameter	Min.	Typ.	Max.	Unit
$V_{IN}$	Supply Voltage Range	2.5		5.5	V
$I_{OUT}$	Output Current	0		5	A
$L$	Inductor		0.33		µH
$C_{IN}$	Input Capacitor		10		µF
$C_{OUT}$	Output Capacitor		44		µF
$T_A$	Operating Ambient Temperature	-40		+85	°C
$T_J$	Operating Junction Temperature	-40		+125	°C

## Thermal Properties

Symbol	Parameter	Min.	Typ.	Max.	Unit
$\theta_{JA}$	Junction-to-Ambient Thermal Resistance <sup>(7)</sup>		38		°C/W

**Note:**

7. See Thermal Considerations in the Application Information section.

## Electrical Characteristics

Minimum and maximum values are at  $V_{IN}=2.5$  V to 5.5 V,  $T_A=-40^\circ\text{C}$  to  $+85^\circ\text{C}$ , unless otherwise noted. Typical values are at  $T_A=25^\circ\text{C}$ ,  $V_{IN}=5$  V, and EN=HIGH.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit

## Operation Description

The FAN53555 is a step-down switching voltage regulator that delivers a programmable output voltage from an input voltage supply of 2.5 V to 5.5 V. Using a proprietary architecture with synchronous rectification, the FAN53555 is capable of delivering 5 A at over 80% efficiency. Pulse currents as high as 6.5 A can be supported by the 05 option. The regulator operates at a nominal frequency of 2.4 MHz at full load, which reduces the value of the external components to 330 nH for the output inductor and 22  $\mu$ F for the output capacitor. High efficiency is maintained at light load with single-pulse PFM.

The FAN53555 integrates an I<sup>2</sup>C-compatible interface, allowing transfers up to 3.4 Mbps. This communication interface can be used to:

- Dynamically re-program the output voltage in 10 mV, 12.826 mV increments (option 04, 09, and 042), 12.5 mV increments (option 23), or 12.967 mV increments (option 24);
- Reprogram the mode to enable or disable PFM;
- Control voltage transition slew rate; or
- Enable / disable the regulator.

## Control Scheme

The FAN53555 uses a proprietary non-linear, fixed-frequency PWM modulator to deliver a fast load transient response, while maintaining a constant switching frequency over a wide range of operating conditions. The regulator performance is independent of the output capacitor ESR, allowing for the use of ceramic output capacitors. Although this type of operation normally results in a switching frequency that varies with input voltage and load current, an internal frequency loop holds the switching frequency constant over a large range of input voltages and load currents.

For very light loads, the FAN53555 operates in Discontinuous Current Diode (DCM) single-pulse PFM, which produces low output ripple compared with other PFM architectures. Transition between PWM and PFM is relatively seamless, providing a smooth transition between DCM and CCM Modes.

PFM can be disabled by programming the MODE bit HIGH in the VSEL registers.

## Enable and Soft-Start

When the EN pin is LOW; the IC is shut down, all internal circuits are off, and the part draws very little current. In this state, I<sup>2</sup>C cannot be written to or read from. For all options except the 04, 24, and 042 options, all register values are kept while EN pin is LOW. For the 04, 24 and 042 options; registers are reset to default values when EN pin is LOW. For all options, registers are reset to default values during a Power On Reset (POR).

When the OUTPUT\_DISCHARGE bit in the CONTROL register is enabled (logic HIGH) and the EN pin is LOW or the BUCK\_ENx bit is LOW, a load is connected from VOUT to GND to discharge the output capacitors.

Raising EN while the BUCK\_ENx bit is HIGH activates the part and begins the soft-start cycle. During soft-start, the modulator's internal reference is ramped slowly to minimize surge currents on the input and prevent overshoot of the

output voltage. Synchronous rectification is inhibited during soft-start, allowing the IC to start into a pre-charged capacitive load.

If large output capacitance values are used, the regulator may fail to start. Maximum C<sub>OUT</sub> capacitance for successfully starting with a heavy constant-current load is approximately:

$$C_{OUTMAX} \approx (I_{LIMPK} - I_{LOAD}) \cdot \frac{320\mu}{V_{OUT}} \quad (1)$$

where C<sub>OUTMAX</sub> is expressed in  $\mu$ F and I<sub>LOAD</sub> is the load current during soft-start, expressed in A.

If the regulator is at its current limit for 16 consecutive current limit cycles, the regulator shuts down and enters 3-state before reattempting soft-start 1700 ms later. This limits the duty cycle of full output current during soft-start to prevent excessive heating.

The IC allows for software enable of the regulator, when EN is HIGH, through the BUCK\_EN bits. BUCK\_EN0 and BUCK\_EN1 are both initialized HIGH in the 00, 04, 08, 09, 23, 24, and 042 options. These options start after a POR regardless of the state of the VSEL pin.

In the 01 and 05 options, BUCK\_EN0 and BUCK\_EN1 are initialized to 10. Using these options, VSEL must be LOW after a POR if the IC is powering the processor used to communicate through I<sup>2</sup>C. The 03 option has the VSEL input to the modulator logic internally tied LOW.

**Table 5. Hardware and Software Enable**

Pins		BITS		
EN	VSEL	BUCK_EN0	BUCK_EN1	Output
0	X	X	X	OFF
1	0	0	X	OFF
1	0	1	X	ON
1	1	X	0	OFF
1	1	X	1	ON

## VSEL Pin and I<sup>2</sup>C Programming Output Voltage

The output voltage is set by the NSELx control bits in VSEL0 and VSEL1 registers. The output voltage for options 00, 01, 03, 05, 08, and 18 is given as:

$$V_{OUT} = 0.60V + NSELx \cdot 10mV \quad (2)$$

For example, when NSEL = 011111 (31 decimal), then V<sub>OUT</sub> = 0.60 + 0.310 = 0.91 V.

For the 04, 042, and 09 options; the output voltage is given as:

$$V_{OUT} = 0.603V + NSELx \cdot 12.826mV \quad (3)$$

For the 13 option, the output voltage is given as:

$$V_{OUT} = 0.80V + NSELx \cdot 10mV \quad (4)$$

For the 23 option, the output voltage is given as:

$$V_{OUT} = 0.60V + NSELx \cdot 12.5mV \quad (5)$$

For the 24 option, the output voltage is given as:

$$V_{OUT} = 0.603V + NSELx \cdot 12.967mV \quad (6)$$

Output voltage can also be controlled by toggling the VSEL pin LOW or HIGH. VSEL LOW corresponds to VSEL0 and VSEL HIGH corresponds to VSEL1. Upon POR, VSEL0 and VSEL1 are reset to their default voltages, shown in Table 9.

### Transition Slew Rate Limiting

When transitioning from a low to high voltage, the IC can be programmed for one of eight possible slew rates using the SLEW bits in the CONTROL register.

**Table 6. Transition Slew Rate**

Decimal	Bin	Slew Rate	
0	000	64.00	mV / $\mu$ s
1	001	32.00	mV / $\mu$ s
2	010	16.00	mV / $\mu$ s
3	011	8.00	mV / $\mu$ s
4	100	4.00	mV / $\mu$ s
5	101	2.00	mV / $\mu$ s
6	110	1.00	mV / $\mu$ s
7	111	0.50	mV / $\mu$ s

Transitions from high to low voltage rely on the output load to discharge  $V_{OUT}$  to the new set point. Once the high-to-low transition begins, the IC stops switching until  $V_{OUT}$  has reached the new set point.

For options 04, 042, 09, 23, and 24 where the Dynamic Voltage Scaling (DVS) step is not 10 mV; the actual slew rate is the corresponding number shown in Table 6 scaled by the ratio of the DVS step to 10 mV. For example, the slew rate of option 13 for Bin=011 is  $8.00 \text{ mV} / \mu\text{s} \times 12.5 \text{ mV} / 10 \text{ mV} = 10.00 \text{ mV} / \mu\text{s}$ .

### Under-Voltage Lockout

When EN is HIGH, the under-voltage lockout keeps the part from operating until the input supply voltage rises HIGH enough to properly operate. This ensures proper operation of the regulator during startup or shutdown.

### Input Over-Voltage Protection (OVP)

When  $V_{IN}$  exceeds  $V_{SDWN}$  (about 6.2 V) the IC stops switching to protect the circuitry from internal spikes above 6.5 V. An internal filter prevents the circuit from shutting down due to noise spikes.

### Power Good (03 Option)

The PGOOD pin is an open-drain output indicating that the regulator is enabled when its state is HIGH. PGOOD pulls LOW under the following conditions:

- Regulator is disabled (EN pin LOW, disabled by I<sup>2</sup>C, fault time-out, UVLO, OVP, over-temperature);
- Regulator is performing a soft-start.

PGOOD remains HIGH during I<sup>2</sup>C initiated  $V_{OUT}$  transitions.

### Current Limiting

A heavy load or short circuit on the output causes the current in the inductor to increase until a maximum current threshold is reached in the high-side switch. Upon reaching this point, the high-side switch turns off, preventing high currents from causing damage. Sixteen consecutive current limit cycles in current limit cause the regulator to shut down and stay off for about 1700  $\mu$ s before attempting a restart.

### Thermal Shutdown

When the die temperature increases, due to a high load condition and/or high ambient temperature, the output switching is disabled until the die temperature falls sufficiently. The junction temperature at which the thermal shutdown activates is nominally 150°C with a 17°C hysteresis.

### Monitor Register (Reg05)

The Monitor register indicates of the regulation state of the IC. If the IC is enabled and is regulating, its value is (1000 0000).

### I<sup>2</sup>C Interface

The FAN53555's serial interface is compatible with Standard, Fast, Fast Plus, and HS Mode I<sup>2</sup>C-Bus® specifications. The FAN53555's SCL line is an input and its SDA line is a bidirectional open-drain output; it can only pull down the bus when active. The SDA line only pulls LOW during data reads and when signaling ACK. All data is shifted in MSB (bit 7) first.

### I<sup>2</sup>C Slave Address

In hex notation, the slave address assumes a 0 LS Bit. The hex slave address is C0 for all options except -42, which has a hex slave address of C4.

**Table 7. I<sup>2</sup>C Slave Address**

Option	Hex	Bits							
		7	6	5	4	3	2	1	0
00 to 24	C0	1	1	0	0	0	0	0	R/W
42	C4	1	1	0	0	0	1	0	R/W

Other slave addresses can be assigned. Contact a Fairchild Semiconductor representative.

## Bus Timing

As shown in Figure 34, data is normally transferred when SCL is LOW. Data is clocked in on the rising edge of SCL. Typically, data transitions shortly after the falling edge of SCL to allow ample time for the data to set up before the next SCL rising edge.

Figure 34. Data Transfer Timing

Each bus transaction begins and ends with SDA and SCL HIGH. A transaction begins with a START condition, which is defined as SDA transitioning from 1 to 0 with SCL HIGH, as shown in Figure 35.

Figure 35. START Bit

A transaction ends with a STOP condition, which is defined as SDA transitioning from 0 to 1 with SCL HIGH, as shown in Figure 36.

Figure 36. STOP Bit

During a read from the FAN53555, the master issues a REPEATED START after sending the register address, and before resending the slave address. The REPEATED START is a 1 to 0 transition on SDA while SCL is HIGH, as shown in Figure 37.

Figure 37. REPEATED START Timing

## High-Speed (HS) Mode

The protocols for High-Speed (HS), Low-Speed (LS), and Fast-Speed (FS) Modes are identical, except the bus speed for HS mode is 3.4 MHz. HS Mode is entered when the bus master sends the HS master code 00001XXX after a START condition. The master code is sent in Fast or Fast-Plus Mode (less than 1 MHz clock); slaves do not ACK this transmission.

The master generates a REPEATED START condition (Figure 35) that causes all slaves on the bus to switch to HS Mode. The master then sends I<sup>2</sup>C packets, as described above, using the HS Mode clock rate and timing.

The bus remains in HS Mode until a STOP bit (Figure 36) is sent by the master. While in HS Mode, packets are separated by REPEATED START conditions (Figure 37).

## Read and Write Transactions

The following figures outline the sequences for data read and write. Bus control is signified by the shading of the packet, defined as Master Drives Bus and Slave Drives Bus. All addresses and data are MSB first.

Table 8. I<sup>2</sup>C Bit Definitions for Figure 38 & Figure 39

Symbol	Definition
R	REPEATED START, see Figure 37
P	STOP, see Figure 36
S	START, see Figure 35
A	ACK. The slave drives SDA to 0 to acknowledge the preceding packet.
$\bar{A}$	NACK. The slave sends a 1 to NACK the preceding packet.
R	REPEATED START, see Figure 37.
P	STOP, see Figure 36.

## Application Information

### Selecting the Inductor

The output inductor must meet both the required inductance and the energy-handling capability of the application. The inductor value affects the average current limit, the output voltage ripple, and the efficiency.

The ripple current ( $\Delta I$ ) of the regulator is:

$$\Delta I \approx \frac{V_{OUT}}{V_{IN}} \cdot \left( \frac{V_{IN} - V_{OUT}}{L \cdot f_{SW}} \right) \quad (7)$$

The maximum average load current,  $I_{MAX(LOAD)}$ , is related to the peak current limit,  $I_{LIM(PK)}$ , by the ripple current such that:

$$I_{MAX(LOAD)} = I_{LIM(PK)} - \frac{\Delta I}{2} \quad (8)$$

The FAN53555 is optimized for operation with  $L=330$  nH, but is stable with inductances up to  $1.0\ \mu\text{H}$  (nominal). The inductor should be rated to maintain at least 80% of its value at  $I_{LIM(PK)}$ . Failure to do so lowers the amount of DC current the IC can deliver.

Efficiency is affected by the inductor DCR and inductance value. Decreasing the inductor value for a given physical size typically decreases the DCR; but since  $\Delta I$  increases, the RMS current increases, as do core and skin-effect losses.

$$I_{RMS} = \sqrt{I_{OUT(DC)}^2 + \frac{\Delta I^2}{12}} \quad (9)$$

The increased RMS current produces higher losses through the  $R_{DS(ON)}$  of the IC MOSFETs as well as the inductor ESR.

Increasing the inductor value produces lower RMS currents, but degrades transient response. For a given physical inductor size, increased inductance usually results in an inductor with lower saturation current.

**Table 10. Effects of Inductor Value (from 330 nH Recommended) on Regulator Performance**

$I_{MAX(LOAD)}$	$\Delta V_{OUT}$ (Eq.(11))	Transient Response
Increase	Decrease	Degraded

### Inductor Current Rating

The current limit circuit can allow substantial peak currents to flow through L1 under worst-case conditions. If it is possible for the load to draw such currents, the inductor should be capable of sustaining the current or failing in a safe manner.

For space-constrained applications, a lower current rating for L1 can be used. The FAN53555 may still protect these inductors in the event of a short circuit, but may not be able to protect the inductor from failure if the load is able to draw higher currents than the DC rating of the inductor.

### Output Capacitor and $V_{OUT}$ Ripple

Table 1 suggests 0805 capacitors, but 0603 capacitors may be used if space is at a premium. Due to voltage effects, the 0603 capacitors have a lower in-circuit capacitance than the 0805 package, which can degrade transient response and output ripple.

Increasing  $C_{OUT}$  has negligible effect on loop stability and can be increased to reduce output voltage ripple or to improve transient response. Output voltage ripple,  $\Delta V_{OUT}$ , is calculated by:

$$\Delta V_{OUT} = \Delta I_L \left[ \frac{f_{SW} \cdot C_{OUT} \cdot ESR^2}{2 \cdot D \cdot (1-D)} + \frac{1}{8 \cdot f_{SW} \cdot C_{OUT}} \right] \quad (10)$$

where  $C_{OUT}$  is the effective output capacitance.

The capacitance of  $C_{OUT}$  decreases at higher output voltages, which results in higher  $\Delta V_{OUT}$ . Equation (10) is only valid for Continuous Current Mode (CCM) operation, which occurs when the regulator is in PWM Mode.

For large  $C_{OUT}$  values, the regulator may fail to start under a load. If an inductor value greater than  $1.0\ \mu\text{H}$  is used, at least  $30\ \mu\text{F}$  of  $C_{OUT}$  should be used to ensure stability.

The lowest  $\Delta V_{OUT}$  is obtained when the IC is in PWM Mode and, therefore, operating at 2.4 MHz. In PFM Mode,  $f_{SW}$  is reduced, causing  $\Delta V_{OUT}$  to increase.

### ESL Effects

The Equivalent Series Inductance (ESL) of the output capacitor network should be kept low to minimize the square-wave component of output ripple that results from the division ratio  $C_{OUT}$  ESL and the output inductor ( $L_{OUT}$ ). The square-wave component due to the ESL can be estimated as:

$$\Delta V_{OUT(SQ)} \approx V_{IN} \cdot \frac{ESL_{COUT}}{L_1} \quad (11)$$

A good practice to minimize this ripple is to use multiple output capacitors to achieve the desired  $C_{OUT}$  value. For example, to obtain  $C_{OUT}=20\ \mu\text{F}$ , a single 22  $\mu\text{F}$  0805 would produce twice the square wave ripple as two  $\times 10\ \mu\text{F}$  0805.

To minimize ESL, try to use capacitors with the lowest ratio of length to width. 0805s have lower ESL than 1206s. If low output ripple is a chief concern, some vendors produce 0508 or 0612 capacitors with ultra-low ESL. Placing additional small-value capacitors near the load also reduces the high-frequency ripple components.

### Input Capacitor

The ceramic input capacitors should be placed as close as possible between the VIN pin and PGND to minimize the parasitic inductance. If a long wire is used to bring power to the IC, additional "bulk" capacitance (electrolytic or tantalum) should be placed between  $C_{IN}$  and the power source lead to reduce under-damped ringing that can occur between the inductance of the power source leads and  $C_{IN}$ .

The effective  $C_{IN}$  capacitance value decreases as  $V_{IN}$  increases due to DC bias effects. This has no significant impact on regulator performance.

## Thermal Considerations

Heat is removed from the IC through the solder bumps to the PCB copper. The junction-to-ambient thermal resistance ( $\theta_{JA}$ ) is largely a function of the PCB layout (size, copper weight, and trace width) and the temperature rise from junction to ambient ( $\Delta T$ ).

For the FAN53555UC,  $\theta_{JA}$  is 38°C/W when mounted on its four-layer evaluation board in still air with two-ounce outer layer copper weight and one-ounce inner layers. Halving the copper thickness results in an increased  $\theta_{JA}$  of 48°C/W.

For long-term reliable operation, the IC's junction temperature ( $T_J$ ) should be maintained below 125°C.

To calculate maximum operating temperature ( $\leq 125^\circ\text{C}$ ) for a specific application:

1. Use efficiency graphs to determine efficiency for the desired  $V_{IN}$ ,  $V_{OUT}$ , and load conditions.
2. Calculate total power dissipation using:

$$P_T = V_{OUT} \times I_{LOAD} \times \left( \frac{1}{\eta} - 1 \right) \quad (12)$$

where  $\eta$  is efficiency from Figure 7 through Figure 12.

3. Estimate inductor copper losses using:

$$P_L = I_{LOAD}^2 \times DCR_L \quad (13)$$

4. Determine IC losses by removing inductor losses (step 3) from total dissipation:

$$P_{IC} = P_T - P_L \quad (14)$$

5. Determine device operating temperature:

$$\Delta T = P_{IC} \times \Theta_{JA} \quad \text{and} \quad (15)$$

$$T_{IC} = T_A + \Delta T$$

It is important to note that the  $R_{DS(ON)}$  of the IC's power MOSFETs increases linearly with temperature at about 1.21%/°C. This causes the efficiency ( $\eta$ ) to degrade with increasing die temperature.

## DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. TO OBTAIN THE LATEST, MOST UP-TO-DATE DATASHEET AND PRODUCT INFORMATION, VISIT OUR WEBSITE AT [HTTP://WWW.FAIRCHILDSEMI.COM](http://WWW.FAIRCHILDSEMI.COM). FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

## AUTHORIZED USE

Unless otherwise specified in this data sheet, this product is a standard commercial product and is not intended for use in applications that require extraordinary levels of quality and reliability. This product may not be used in the following applications, unless specifically approved in writing by a Fairchild officer: (1) automotive or other transportation, (2) military/aerospace, (3) any safety critical application – including life critical medical equipment – where the failure of the Fairchild product reasonably would be expected to result in personal injury, death or property damage. Customer's use of this product is subject to agreement of this Authorized Use policy. In the event of an unauthorized use of Fairchild's product, Fairchild accepts no liability in the event of product failure. In other respects, this product shall be subject to Fairchild's Worldwide Terms and Conditions of Sale, unless a separate agreement has been signed by both Parties.

## ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, [www.fairchildsemi.com](http://www.fairchildsemi.com), under Terms of Use

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.

## PRODUCT STATUS DEFINITIONS

### Definition of Terms

Datasheet Identification	Product Status	Definition
Advance Information	Formative / In Design	Datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	Datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
No Identification Needed	Full Production	Datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve the design.
Obsolete	Not In Production	Datasheet contains specifications on a product that is discontinued by Fairchild Semiconductor. The datasheet is for reference information only.
