FAN8036

5-CH Motor Driver + 2-Regulator

Features

- 4-CH Balanced Transformerless (BTL) Driver
- 1-CH (Forward Reverse) Control DC Motor Driver
- Operating Supply Voltage (4.5V ~ 13.2V)
- Built in Thermal Shut Down Circuit (TSD)
- Built in Channel Mute Circuit
- Built in Power Save Mode Circuit
- Built in TSD Monitor Circuit
- Built in 2 Regulators
- Built in 2-OP AMPs

Description

The FAN8036 is a monolithic integrated circuit suitable for a 5-CH motor driver which drives the tracking actuator, focus actuator, sled motor, spindle motor, and tray motor of the CDP/CAR-CD/DVDP systems.

48-QFPH-1414

Typical Application

- Compact Disk Player
- Video Compact Disk Player
- Car Compact Disk Player
- Digital Video Disk Player

Application Information

1. Thermal Shutdown

- The TSD circuit is activated at the junction temperature of 160°C and deactivated at 135°C with the hysteresis of 25°C. During the thermal shutdown, the TSD circuit keeps all the output driver off.

2. CH Mute Function

- When the mute pin is high, the TR Q1 is on and Q2 is off, so the bias circuit is enabled. When the mute pin is low (GND), the TR Q1 is off and Q2 is on, so the bias circuit is disabled.
- During the mute on state, all the circuit blocks except for the variable regulator remain off, and the low power quiescent state is established.
- Truth table is as follows;

Pin 19, 20	Mute
High	Mute-Off
Low	Mute-On

3. Power Save Function

- When the pin21 is high, the TR Q3 becomes on and Q4 off, so the bias circuit is enabled. When the pin21 is low (GND), the TR Q3 becomes off and Q4 is on, so the bias circuit is disabled.
- During the power save on state, this function keeps all the circuit blocks off, and the low power quiescent state is established.
- Truth table is as follows;

Pin21	Power Save
High	Power Save Off
Low	Power Save On

4. TDS Monitor Function

- Pin 22 is TSD monitor pin, which detects the state of the TSD block and generates the TSD-monitor signal.
- In the normal state Q5 is on, and Q6 is off. When the TSD block is activated Q5 becomes off, and thus the voltage of pin22 keeps low.
- Truth table is as follows;

TSD	Pin22
TSD Off	High
TSD On	Low

5. Focus, Tracking Actuator, Spindle, Sled Motor Drive Part

- The Vref at pin 43 is for eliminating the dc components from the input signals and can set by an external circuit.
- The voltage gain from Vin to output is as follows ;

$$V_{in} = V_{ref} + \Delta V$$

$$DOP = V_D + 4\Delta V$$

$$DON = V_D - 4\Delta V$$

$$V_{out} = DOP - DON = 8\Delta V$$

$$\text{Gain} = 20 \log \frac{V_{out}}{\Delta V} = 20 \log 8 = 18 \text{dB}$$

- Where ΔV means just ac component.
- The total input to output voltage gain is the sum of the input OP amp network gain and 18dB.
- The output stage is the balanced transformerless (BTL) driver.
- The bias voltage V_p is expressed as ;

$$\begin{aligned} V_P &= (PVCC1 - V_{DP} - V_{CESAT} Q_P) \times \frac{62k}{60k + 62k} + V_{CESAT} Q_P \\ &= \frac{PVCC1 - V_{DP} - V_{CESAT} Q_P}{1.97} + V_{CESAT} Q_P \end{aligned} \quad \text{----- (1)}$$

6. Tray, Changer,panel Motor Drive Part

- Rotational direction control

The forward and reverse rotational direction is controlled by FWD (pin16) and REV (pin17) and the input conditions are as follows;

INPUT		OUTPUT		
FWD	REV	OUT 1	OUT 2	State
H	H	Vp	Vp	Brake
H	L	H	L	Forward
L	H	L	H	Reverse
L	L	-	-	High impedance

- Where Vp(Power reference voltage) is approximately 3.75V at PVCC2=8V according to equation (1).
- Motor speed control (When SVCC=5V, PVCC2=8V)
 - The maximum torque is obtained when the pin15(CTL) is open.
 - If the voltage of the pin15 (CTL) is 0V, the motor will not operate.
 - When the control voltage (pin15) is between 0 and 3.0V, the differential output voltage $V(\text{out1, out2})$ is about two times of control voltage. The output gain is 6dB.
 - When the control voltage is greater than 3.0V, the output voltage is saturated at the 6.0V because of the output swing limitation.

7. Regulator1 Part

- The output voltage of the regulator1 is fixed to 5V.
- When power save on or TSD on, regulator1 is disabled.
- Truth table is as follows;

RES1(Pin6)	REGO1
HIGH	Active
LOW	Deactive

8. Regulator2 Part

- The output of the regulator2 is variable.
- The input impedance of the REGCTL pin is 50kΩ.
- The REGCTL input circuit is as follows;

- The output voltage(VREGO2) is decided as follows;

$$V_{REGO2} = (1.56V + V_{REGCTL}) \times 0.95$$

- When the REGCTL pin is connect to the ground or open, the regulator output voltage become 1.56V.
- When power save on or TSD on, regulator2 is disabled.
- Truth table is as follows;

RES2(Pin7)	REGO2
HIGH	Active
LOW	Deactive
