

CMOS Static RAM 1 Meg (64K x 16-Bit)

IDT71016S/NS

Features

- 64K x 16 advanced high-speed CMOS Static RAM
- Equal access and cycle times
 - Commercial and Industrial: 12/15/20ns
- One Chip Select plus one Output Enable pin
- Bidirectional data inputs and outputs directly TTLcompatible
- Low power consumption via chip deselect
- Upper and Lower Byte Enable Pins
- Commercial and industrial product available in 44-pin Plastic SOJ package and 44-pin TSOP package

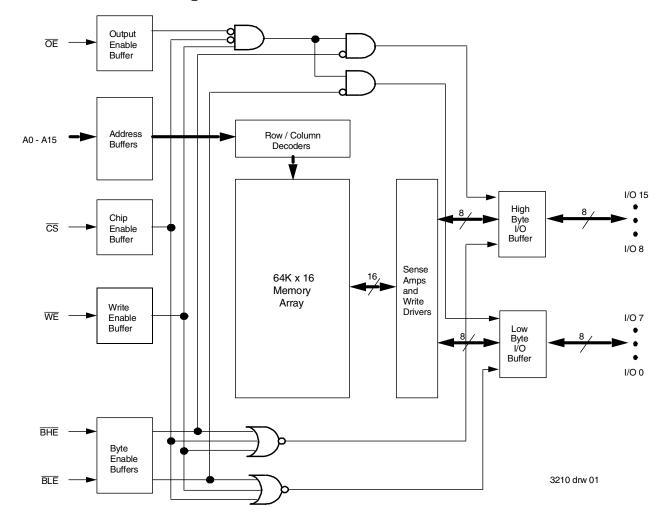

Description

The IDT71016 is a 1,048,576-bit high-speed Static RAM organized as $64K \times 16$. It is fabricated using IDT's high-perfomance, high-reliability CMOS technology. This state-of-the-art technology, combined with innovative circuit design techniques, provides a cost-effective solution for high-speed memory needs.

The IDT71016 has an output enable pin which operates as fast as 7ns, with address access times as fast as 12ns. All bidirectional inputs and outputs of the IDT71016 are TTL-compatible and operation is from a single 5V supply. Fully static asynchronous circuitry is used, requiring no clocks or refresh for operation.

The IDT71016 is packaged in a JEDEC standard 44-pin Plastic SOJ and 44-pin TSOP Type II.

Іоит	DC Output Current	50	mA

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may
 cause permanent damage to the device. This is a stress rating only and functional
 operation of the device at these or any other conditions above those indicated in the
 operational sections of this specification is not implied. Exposure to absolute maximum
 rating conditions for extended periods may affect reliability.
- 2. VTERM must not exceed Vcc + 0.5V.

Timing Waveform of Read Cycle No. 1^(1,2,3)

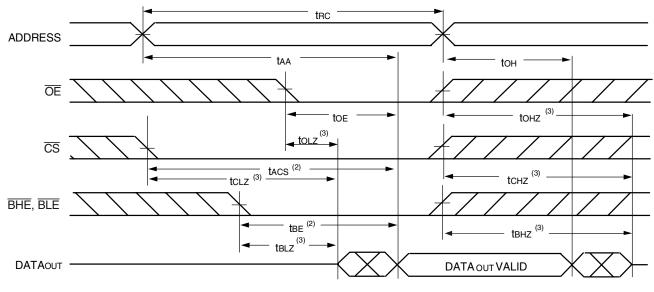

NOTES:

- 1. $\overline{\text{WE}}$ is HIGH for Read Cycle.
- 2. Device is continuously selected, \overline{CS} is LOW.
- 3. OE, BHE, and BLE are LOW.

5

Timing Waveform of Read Cycle No. 2⁽¹⁾

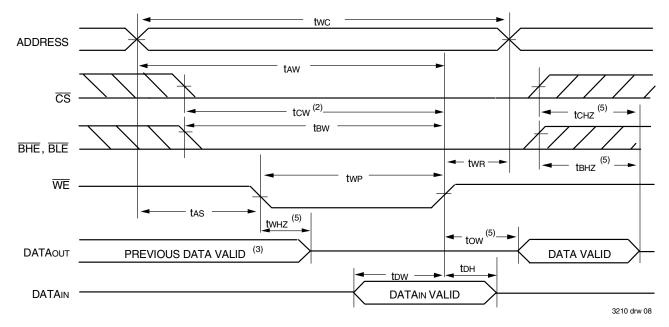

NOTES:

3210 drw 07

- 1. WE is HIGH for Read Cycle.
- 2. Address must be valid prior to or coincident with the later of $\overline{\text{CS}}$, $\overline{\text{BHE}}$, or $\overline{\text{BLE}}$ transition LOW; otherwise tax is the limiting parameter.
- 3. Transition is measured ±200mV from steady state.

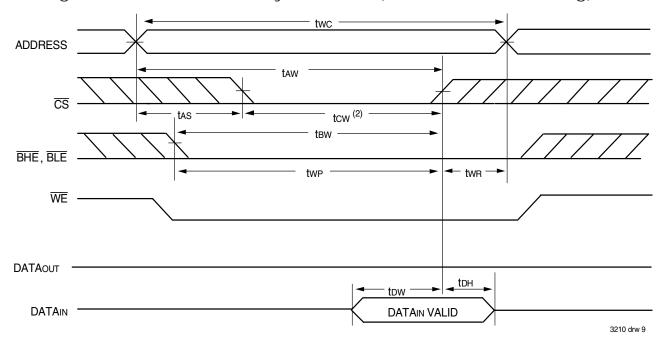

Timing Waveform of Write Cycle No. 1 (WE Controlled Timing)(1,2,4)

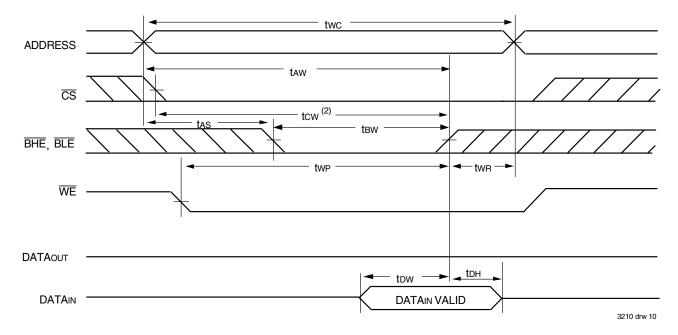

NOTES:

- 1. A write occurs during the overlap of a LOW $\overline{\text{CS}}$, LOW $\overline{\text{BHE}}$ or $\overline{\text{BLE}}$, and a LOW $\overline{\text{WE}}$.
- 2. $\overline{\text{OE}}$ is continuously HIGH. If during a $\overline{\text{WE}}$ controlled write cycle $\overline{\text{OE}}$ is LOW, twp must be greater than or equal to twHz + tow to allow the I/O drivers to turn off and data to be placed on the bus for the required tow. If $\overline{\text{OE}}$ is HIGH during a $\overline{\text{WE}}$ controlled write cycle, this requirement does not apply and the minimum write pulse is as short as the specified twp.
- 3. During this period, I/O pins are in the output state, and input signals must not be applied.
- 4. If the CS LOW or BHE and BLE LOW transition occurs simultaneously with or after the WE LOW transition, the outputs remain in a high-impedance state.
- 5. Transition is measured ±200mV from steady state.

Timing Waveform of Write Cycle No. 2 (CS Controlled Timing)(1,4)

Timing Waveform of Write Cycle No. 3 (BHE, BLE Controlled Timing)(1,4)

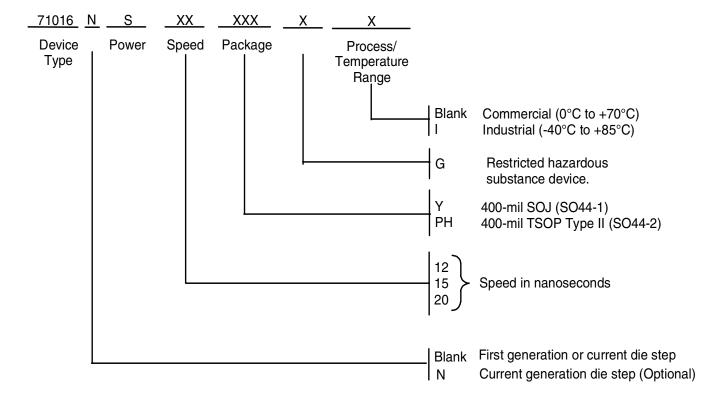

NOTES:

- 1. A write occurs during the overlap of a LOW \overline{CS} , LOW \overline{BHE} or \overline{BLE} , and a LOW \overline{WE} .

 2. \overline{OE} is continuously HIGH. If during a \overline{WE} controlled write cycle \overline{OE} is LOW, two must be greater than or equal to twhz + tow to allow the I/O drivers to turn off and data to be placed on the bus for the required tow. If \overline{OE} is HIGH during a \overline{WE} controlled write cycle, this requirement does not apply and the minimum write pulse is as short as the specified twp.
- 3. During this period, I/O pins are in the output state, and input signals must not be applied.
- 4. If the $\overline{\text{CS}}$ LOW or $\overline{\text{BHE}}$ and $\overline{\text{BLE}}$ LOW transition occurs simultaneously with or after the $\overline{\text{WE}}$ LOW transition, the outputs remain in a high-impedance state.
- Transition is measured ±200mV from steady state.
