

ILC7010/7011

80mA SC70 Low Noise CMOS RF-LDO™ Regulator

Features

- 1% output voltage accuracy
- Low noise
- Only 75 μ A ground current at 80mA load
- Ripple rejection up to 75dB at 1kHz
- Excellent line and load transient response
- Guaranteed to 80mA output current
- Industry standard five lead SC70 packages
- Fixed 2.5V, 2.6V, 2.7V, 2.8V, 2.85V, 2.9V, 3.0V, 3.1V, 3.3V and custom output voltage options

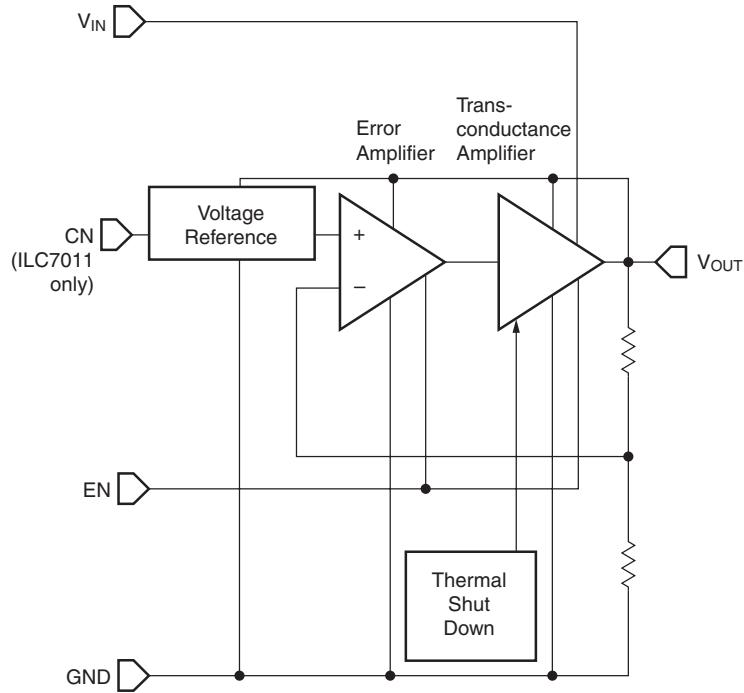

Applications

- Cellular phones
- Wireless communicators
- PDAs / palmtops / organizers
- Battery powered portable electronics

General Description

The ILC7010/7011 is an 80mA, Ultra Low Noise, Low Dropout (LDO) linear regulator, designed and processed in CMOS technology. This process combines the best CMOS features of low quiescent current, small size and low dropout voltage with the best bipolar features of high ripple rejection, ultra low noise and power handling capability. The ILC7010/7011 offers a quiescent current of less than 100 μ A, a logic level enable (regulator EN) pin, a footprint that is half the size of the industry standard SOT-23, and a low dropout voltage of 25mV at 10mA. With better than 70 dB (1kHz) of ripple rejection, low noise of 40 μ V RMS and 1% output voltage accuracy, the ILC7010/7011 sets a new standard in linear regulators for communications and personal electronics applications.

Block Diagram

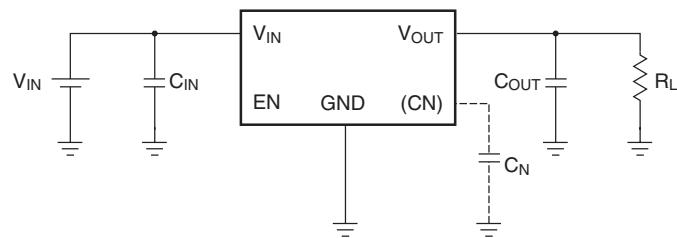

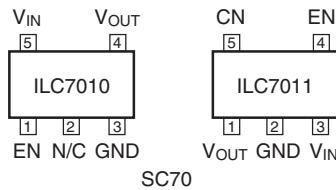

Figure 1.

Pin Configuration

Pin Definition ILC7010

Pin Number	Pin Name	Pin Function Description
1	EN	Enable input. High level enables V _{OUT} while Low level commands shutdown mode and discharge C _{OUT} to GND
2	N/C	Not connected
3	GND	Ground of the IC
4	V _{OUT}	Voltage output. Regulated output voltage
5	V _{IN}	Supply voltage input

Pin Definition ILC7011

Pin Number	Pin Name	Pin Function Description
1	V _{OUT}	Voltage output. Regulated output voltage
2	GND	Ground of the IC
3	V _{IN}	Supply voltage input
4	EN	Enable input. High level enables V _{OUT} while Low level commands shutdown mode and discharge C _{OUT} to GND
5	CN	Optional noise bypass capacitor

Absolute Maximum Ratings

Absolute maximum ratings are the values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

Parameter	Min.	Max.	Units
Supply Voltage		10	V
EN Input Voltage	-0.3	$V_{IN} + 0.3$	V
Output Voltage	-0.3	$V_{IN} + 0.3$	V
Junction Temperature (T _J)		150, Internally limited	°C
Storage Temperature	-40	150	°C
Lead Soldering Temperature, 10 seconds		300	°C
Power Dissipation (P _D)		150	mW

Recommended Operating Conditions

Parameter	Conditions	Min.	Typ.	Max.	Units
Supply Voltage V _{DD}	V_{IN} to GND	$V_{OUT}+V_{DO}$	$V_{OUT}+1$	$V_{OUT}+4$	V
Peak Output Current	I _{OUT} to GND, tpw=2mS			120	mA
Ambient Operating Temperature	T _A	-40		85	°C

Electrical Specifications

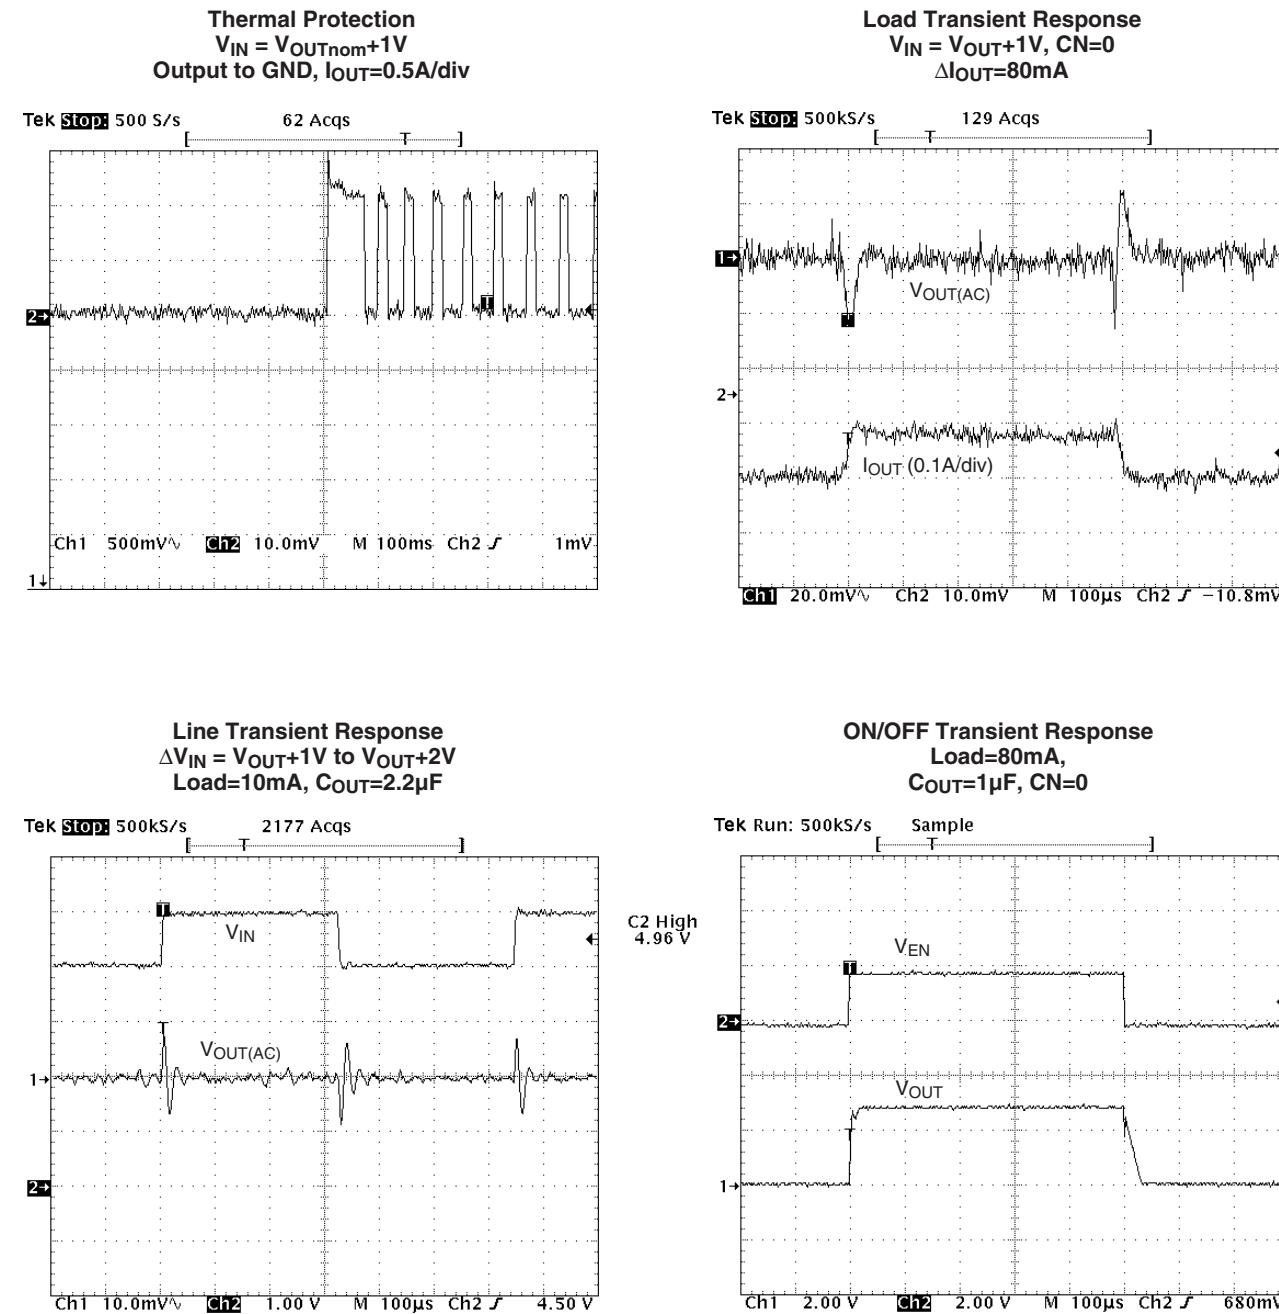

$V_{IN}=V_{OUT}+1V$, $I_{OUT}=1mA$, $V_{EN}=2V$ and $T_A = +25^{\circ}C$ using circuit in Figure 1 with $C_{IN}=C_{OUT}=1\mu F$, $C_N=0$, unless otherwise specified

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Units
Output Voltage	V_{OUT}		0.99 V_{OUTnom}	V_{OUTnom}	1.01 V_{OUTnom}	V
Ground pin Current	I_{GND}	$I_{OUT}=10mA$		70	90	μA
		$I_{OUT}=80mA$		90	110	
Line Regulation	$\Delta V_{OUT}/V_{OUT}/\Delta V_{IN}$	$V_{IN}: V_{OUT}+1V$ to $V_{OUT}+2V$		0.017	0.075	%/V
Load Regulation	$\Delta V_{OUT}/V_{OUT}$	$I_{OUT}=1$ to $80mA$		0.12	0.2	%
Dropout Voltage ^{1,2}	V_{DO}	$I_{OUT}=10mA$, $V_{OUT}>2.8V$		25	30	mV
		$I_{OUT}=20mA$, $V_{OUT}>2.8V$		50	60	
		$I_{OUT}=80mA$, $V_{OUT}>2.8V$		220	250	
Shutdown (OFF) current	I_{OFF}	$V_{EN}=0$		10	40	nA
EN Input Voltage	V_{EN}	High = ON state Low = OFF state	2		0.6	V
EN Input Current	I_{EN}	$V_{EN}=0.6V$		0.3		μA
		$V_{EN}=2V$		1		
Output Noise Voltage ILC7011	e_N	$BW=300Hz$ to $50kHz$ $C_{IN}=C_{OUT}=2.2\mu F$, $C_N=10nF$ $I_{OUT}=10mA$		40		μV RMS
Ripple Rejection	PSRR	$C_{OUT}=4.7\mu F$, $120Hz$ $I_{OUT}=80mA$		65		dB
Dynamic Line Regulation	ΔV_{OUT} (line)	$\Delta V_{IN}=1V$, $I_{OUT}=80mA$, $tr/tr=2\mu S$		10		mV
Dynamic Load Regulation	ΔV_{OUT} (load)	$\Delta I_{OUT}=80mA$, $tr<5mS$		15		mV
Resistance Discharge in OFF state	R_{DISC}	$V_{EN}=0$		1.5		k Ω

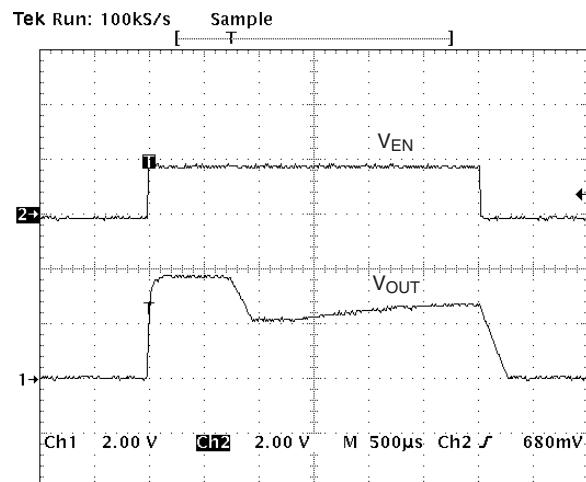

Notes:

1. For $2.5V < V_{OUT} < 2.8V$ refer to diagram "Dropout Voltage vs. Output Voltage."
2. Dropout voltage is defined as the input to output differential voltage at which the output voltage drops 2% below the nominal value measured with 1V differential.

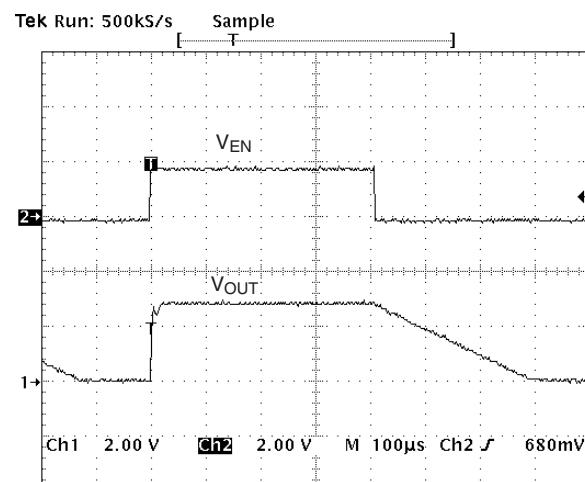

Typical Applications Diagrams

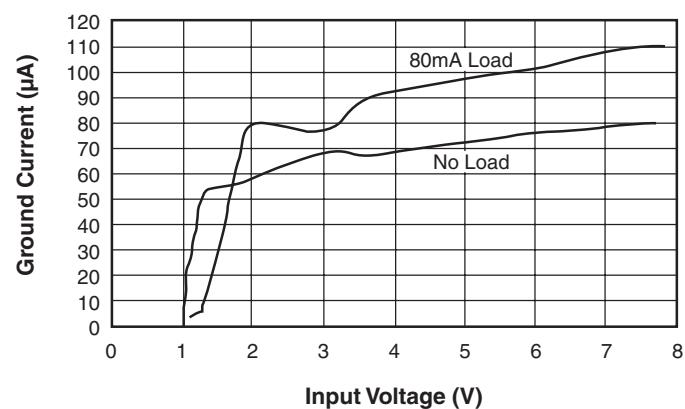

ON/OFF Transient Response

Application Information

Capacitor Selection

In general ceramic capacitors are preferred due to their superior ESR performance. Those with X5R dielectric offer the best temperature coefficient.

An input capacitor of $1\mu\text{F}$ or greater, connected between Input and Ground, located in close proximity to the device will improve the transient response and the noise rejection.

An output capacitor of at least $1\mu\text{F}$ is required to maintain regulator loop stability. Stable operation will be achieved with a wide variety of capacitors with ESR ranging from $10\text{m}\Omega$ to 10Ω .

An optional capacitor connected between the CN pin and ground can significantly reduce noise on the output. Values ranging from 470pF to 10nF can be used, depending upon the sensitivity to output noise in the application. Care should be taken to prevent noise from external sources to enter into the CN pin, which is a very sensitive, high impedance pin. Leakage currents into this pin will directly affect the regulator accuracy and should be kept as low as possible.

Control Functions

Enable Pin

Applying a voltage of 0.6V or less at the Enable pin will disable the output, reducing the quiescent output current to less than $1\mu\text{A}$, while a voltage of 2V or greater will enable the device. If this shutdown function is not needed, the pin can simply be connected to the V_{IN} pin. Allowing this pin to float will cause erratic operation.

Thermal Protection

The ILC7010/7011 is designed to supply high peak output currents for brief periods, however this output load will cause the device temperature to increase and exceed maximum ratings due to power dissipation. During output overload conditions, when the die temperature exceeds the shutdown limit temperature of $125\text{ }^{\circ}\text{C}$, onboard thermal protection will disable the output until the temperature drops below this limit, at which point the output is then re-enabled.

During a thermal shutdown situation the user may assert the power-down function at the Enable pin, reducing power consumption to the minimum level.

Thermal Characteristics

ILC7010/7011 is designed to supply up to 80mA at the specified output voltage with an operating die (junction) temperature of up to $125\text{ }^{\circ}\text{C}$. While the power dissipation is calculated from known electrical parameters, the thermal resistance is a result of the thermal characteristics of the compact SC70 surface-mount package and the surrounding PC Board copper to which it is mounted.

The relationship describing the thermal behavior of the package is:

$$P_{D(\text{max})} = \frac{T_{J(\text{max})} - T_A}{\Theta_{JA}}$$

where $T_{J(\text{max})}$ is the maximum junction temperature of the die, which is $125\text{ }^{\circ}\text{C}$, and T_A is the ambient operating temperature. Θ_{JA} is dependent on the surrounding PC board layout and can be empirically obtained. While the Θ_{JC} (junction-to-case) of the SC70 package is specified at $224\text{ }^{\circ}\text{C}/\text{W}$, the Θ_{JA} of the minimum PWB footprint will be at least $235\text{ }^{\circ}\text{C}/\text{W}$.

This can be improved upon by providing a heat sink of surrounding copper ground on the PCB.

Depending on the size of the copper area, the resulting Θ_{JA} can range from approximately $180\text{ }^{\circ}\text{C}/\text{W}$ for one square inch, to nearly $130\text{ }^{\circ}\text{C}/\text{W}$ for 4 square inches.

The addition of backside copper with through-holes, stiffeners, and other enhancements can also aid in reducing this value. The heat contributed by the dissipation of other devices located nearby must be included in design considerations.

Once the limiting parameters in the thermal relationship have been determined, the electrical design should be verified to ensure that the device remains within specified operating conditions.

If overload conditions are not considered, it is possible for the device to enter a thermal cycling loop, in which the circuit enters a shutdown condition, cools, reenables, and then again overheats and shuts down repeatedly due to an unmanaged fault condition.

General PCB Layout Considerations

To achieve the full performance of the device, careful circuit layout and grounding technique must be observed. Establishing a small local ground, to which the GND pin, the output and bypass capacitors are connected, is recommended, while the input capacitor should be grounded to the main ground plane.

The quiet local ground is then routed back to the main ground plane using feedthrough vias.

In general, the high frequency compensation components (input, bypass, and output capacitors) should be located as close to the device as possible.

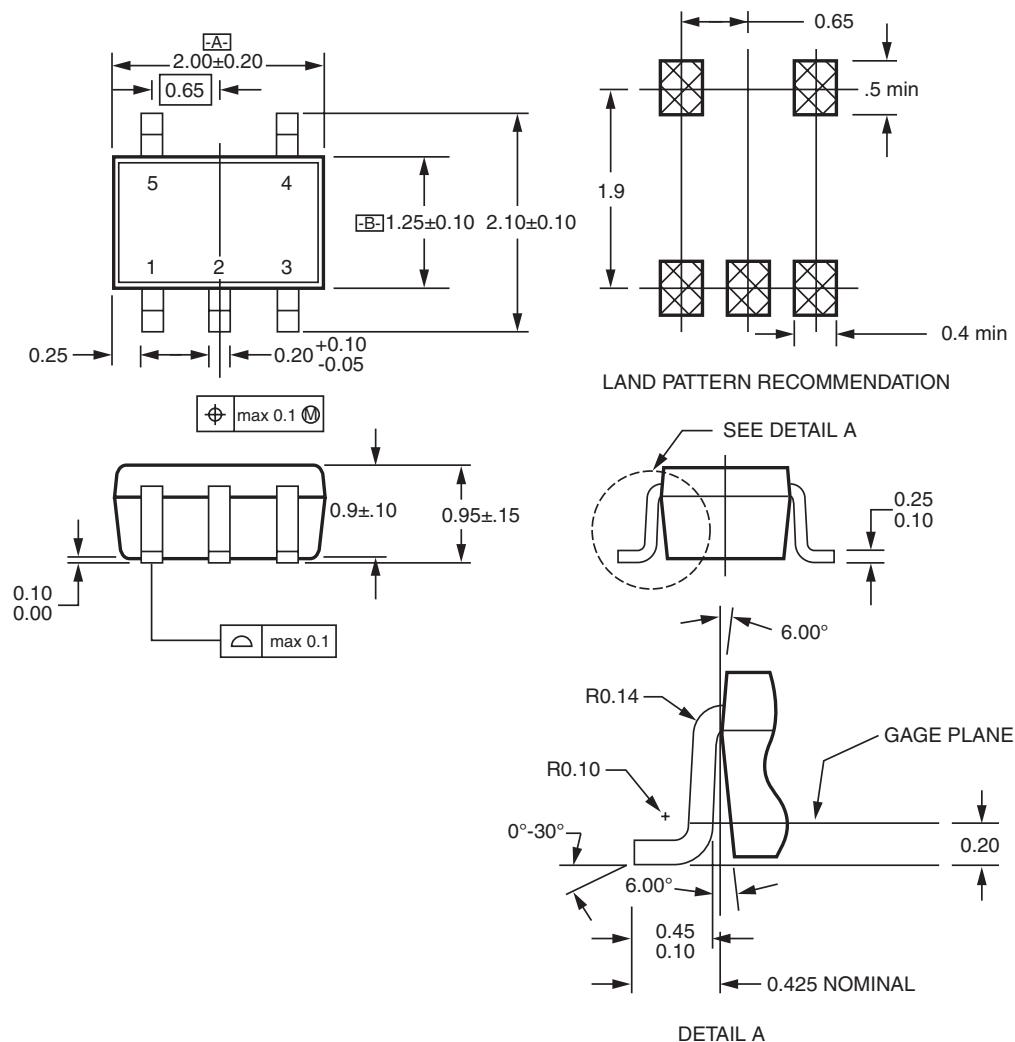

The proximity of the output capacitor is especially important to achieve optimal noise compensation from the onboard error amplifier, especially during high load conditions.

A large copper area in the local ground will provide the heat sinking discussed above when high power dissipation significantly increases the temperature of the device.

Component-side copper provides significantly better thermal performance for this surface-mount device, compared to that obtained when using only copper planes on the underside.

Mechanical Dimensions

5 Lead SC70

NOTES:

- A. CONFORMS TO EIAJ REGISTERED OUTLINE DRAWING SC88A.
- B. DIMENSIONS DO NOT INCLUDE BURRS OR MOLD FLASH.
- C. DIMENSIONS ARE IN MILLIMETERS.
