

General Description

The MAX3679A is a low-jitter precision clock generator with the integration of three LVPECL and one LVCMOS outputs optimized for Ethernet applications. The device integrates a crystal oscillator and a phase-locked loop (PLL) clock multiplier to generate high-frequency clock outputs for Ethernet applications.

Maxim's proprietary PLL design features ultra-low jitter (0.36ps_{RMS}) and excellent power-supply noise rejection, minimizing design risk for network equipment.

Applications

Ethernet Networking Equipment

Pin Configuration appears at end of data sheet.

Features

- ♦ Crystal Oscillator Interface: 25MHz
- ♦ CMOS Input: 25MHz
- **♦** Output Frequencies for Ethernet 62.5MHz, 125MHz, 156.25MHz, 312.5MHz
- - 0.14ps_{RMS} (1.875MHz to 20MHz) 0.36ps_{RMS} (12kHz to 20MHz)
- **♦ Excellent Power-Supply Noise Rejection**
- **♦ No External Loop Filter Capacitor Required**

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX3679AETJ+	-40°C to +85°C	32 TQFN-EP*

+Denotes a lead(Pb)-free/RoHS-compliant package. *EP = Exposed pad.

ABSOLUTE MAXIMUM RATINGS

Supply Voltage Range VCC, VCCA,
VDDO_A, VCCO_A, VCCO_B0.3V to +4.0V
Voltage Range at REF_IN, IN_SEL,
SELA[1:0], SELB[1:0], RES[1:0],
QAC_OE, QA_OE, QB0_OE, QB1_OE,
MR, BYPASS0.3V to (V _{CC} + 0.3V)
Voltage Range at X_IN Pin0.3V to +1.2V

Voltage Range at GNDO_A0.3V	to +0.3V
Voltage Range at X_OUT0.3V to (VC	c - 0.6V)
Current into QA_C	±50mA
Current into QA, QA, QB0, QB0, QB1, QB1	56mA
Continuous Power Dissipation ($T_A = +70^{\circ}C$)	
32-Pin TQFN (derate 34.5mW/°C above +70°C)	2759mW
Operating Junction Temperature Range55°C to	+150°C
Storage Temperature Range65°C to	+160°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

 $(V_{CC} = +3.0 \text{V to } +3.6 \text{V}, T_A = -40 ^{\circ}\text{C} \text{ to } +85 ^{\circ}\text{C}, \text{ unless otherwise noted.}$ Typical values are at $V_{CC} = +3.3 \text{V}, T_A = +25 ^{\circ}\text{C}, \text{ unless otherwise noted.}$ (Notes 1, 2, and 3)

NIXI/N

Detailed Description

The MAX3679A is a low-jitter clock generator designed to operate at Ethernet frequencies. It consists of an on-chip crystal oscillator, PLL, programmable dividers, LVCMOS output buffer, and LVPECL output buffers. Using a low-frequency clock (crystal or CMOS input) as a reference, the internal PLL generates a high-frequency output clock with excellent jitter performance.

Crystal Oscillator

An integrated oscillator provides the low-frequency reference clock for the PLL. This oscillator requires an external crystal connected between X_IN and X_OUT. Crystal frequency is 25MHz.

REF_IN Buffer

An LVCMOS-compatible clock source can be connected to REF_IN to serve as the reference clock.

The LVCMOS REF_IN buffer is internally biased to allow AC- or DC-coupling. It is designed to operate up to 320MHz.

PLL

The PLL takes the signal from the crystal oscillator or reference clock input and synthesizes a low-jitter, high-frequency clock. The PLL contains a phase-frequency detector (PFD), a lowpass filter, and a 625MHz voltage-controlled oscillator (VCO). The VCO output is connected to the PFD input through a feedback divider. The PFD compares the reference frequency to the divided-down VCO output (fvcO/25) and generates a control signal that keeps the VCO locked to the reference clock. The high-frequency VCO output clock is sent to the output dividers. To minimize noise-induced jitter, the VCO supply (VCCA) is isolated from the core logic and output buffer supplies.

Output Dividers

The output divider is programmable to allow a range of output frequencies. See Table 2 for the divider input settings. The output dividers are automatically set to divide by 1 when the MAX3679A is in bypass mode (BYPASS = 0).

LVPECL Drivers

The high-frequency outputs—QA, QB0, and QB1—are differential PECL buffers designed to drive transmission lines terminated with 50Ω to V_{CC} - 2.0V. The maximum operating frequency is specified up to 320MHz. Each output can be individually disabled, if not used. The outputs go to a logic 0 when disabled.

LVCMOS Driver

QA_C, the LVCMOS output, is designed to drive a single-ended high-impedance load. The maximum operating frequency is specified up to 160MHz. This output can be disabled by the QAC_OE pin if not used and goes to a high impedance when disabled.

Reset Logic/POR

During power-on, the power-on reset (POR) signal is generated to synchronize all dividers. An external master reset (MR) signal is not required.

Applications Information Power-Supply Filtering

The MAX3679A is a mixed analog/digital IC. The PLL contains analog circuitry susceptible to random noise. In addition to excellent on-chip power-supply noise rejection, the MAX3679A provides a separate power-supply pin, V_{CCA}, for the VCO circuitry. Figure 2 illustrates the recommended power-supply filter network for V_{CCA}. The purpose of this design technique is to ensure clean input power supply to the VCO circuitry and to improve the overall immunity to power-supply noise. This network requires that the power supply is +3.3V ±5%. Decoupling capacitors should be used on all other supply pins for best performance.

Output Divider Configuration

Table 2 shows the input settings required to set the output dividers. Leakage in the OPEN case must be less than 1μ A. Note that when the MAX3679A is in bypass mode (BYPASS set low), the output dividers are automatically set to divide by 1.

Table 1. Output Frequency Determination

XO OR CMOS INPUT FREQUENCY (MHz)	FEEDBACK DIVIDER, M	VCO FREQUENCY (MHz)	OUTPUT DIVIDER, NA AND NB	OUTPUT FREQUENCY (MHz)	APPLICATIONS	
			÷2	312.5		
O.E.	25 25 625	O.F.	COE	÷4	÷4 156.25	Ethernet
25 25		023	÷5	125	Linemei	
			÷10	62.5]	

Table 2. Output Divider Configuration

INF	NA/NB DIVIDER	
SELA1/SELB1	SELA0/SELB0	NA/NO DIVIDEN
0	0	÷2*
1	0	÷4
1	1	÷5
0	OPEN	÷10

^{*}Maximum guaranteed output frequency is 160MHz for CMOS and 320MHz for LVPECL output.

Figure 3. Crystal Layout

Crystal Selection

The crystal oscillator is designed to drive a fundamental mode, AT-cut crystal resonator. See Table 3 for recommended crystal specifications. See Figure 4 for external capacitance connection.

Table 3. Crystal Selection Parameters

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS
Crystal Oscillation Frequency	fosc		25		MHz
Shunt Capacitance	Co		2.0	7.0	pF
Load Capacitance	CL		18		pF
Equivalent Series Resistance (ESR)	R _S			50	Ω
Maximum Crystal Drive Level				300	μW

Figure 4. Crystal, Capacitors Connection

Crystal Input Layout and Frequency Stability

The crystal, trace, and two external capacitors should be placed on the board as close as possible to the MAX3679A's X_IN and X_OUT pins to reduce crosstalk of active signals into the oscillator.

The layout shown in Figure 3 gives approximately 3pF of trace plus footprint capacitors per side of the crystal (Y1). The dielectric material is FR4 and dielectric thickness of the reference board is 15 mils. Using a 25MHz crystal and the capacitor values of C22 = 27pF and C23 = 33pF, the measured output frequency accuracy is -14ppm at +25°C ambient temperature.

Interfacing with LVPECL Outputs

The equivalent LVPECL output circuit is given in Figure 8. These outputs are designed to drive a pair of 50Ω transmission lines terminated with 50Ω to $V_{TT} = V_{CC}$ - 2V. If a separate termination voltage (V_{TT}) is not available, other

Figure 5. Thevenin Equivalent of Standard PECL Termination

Figure 6. AC-Coupled PECL Termination

Figure 7. Simplified REF_IN Pin Circuit Schematic

termination methods can be used such as shown in Figures 5 and 6. Unused outputs should be disabled and can be left open. For more information on LVPECL terminations and how to interface with other logic families, refer to Application Note 291: *HFAN-01.0: Introduction to LVDS, PECL, and CML*.

Interface Models

Figures 7, 8, and 9 show examples of interface models.

Layout Considerations

The inputs and outputs are critical paths for the MAX3679A, and care should be taken to minimize discontinuities on these transmission line. Here are some suggestions for maximizing the MAX3679A's performance:

- An uninterrupted ground plane should be positioned beneath the clock I/Os.
- Ground pin vias should be placed close to the IC and the input/output interfaces to allow a return current path to the MAX3679A and the receive devices.
- Supply decoupling capacitors should be placed close to the MAX3679A supply pins.
- Maintain 100Ω differential (or 50Ω single-ended) transmission line impedance out of the MAX3679A.
- Use good high-frequency layout techniques and a multilayer board with an uninterrupted ground plane to minimize EMI and crosstalk.

Refer to the MAX3679A Evaluation Kit for more information.

Exposed-Pad Package

The exposed pad on the 32-pin TQFN package provides a very low inductance path for return current traveling to the PCB ground plane. The pad is also electrical ground on the MAX3679A and must be soldered to the circuit board ground for proper electrical performance.
