

---

The following document contains information on Cypress products. Although the document is marked with the name "Spansion", the company that originally developed the specification, Cypress will continue to offer these products to new and existing customers.

**Continuity of Specifications**

There is no change to this document as a result of offering the device as a Cypress product. Any changes that have been made are the result of normal document improvements and are noted in the document history page, where supported. Future revisions will occur when appropriate, and changes will be noted in a document history page.

**Continuity of Ordering Part Numbers**

Cypress continues to support existing part numbers. To order these products, please use only the Ordering Part Numbers listed in this document.

**For More Information**

Please contact your local sales office for additional information about Cypress products and solutions.

**About Cypress**

Cypress (NASDAQ: CY) delivers high-performance, high-quality solutions at the heart of today's most advanced embedded systems, from automotive, industrial and networking platforms to highly interactive consumer and mobile devices. With a broad, differentiated product portfolio that includes NOR flash memories, F-RAM™ and SRAM, Traveo™ microcontrollers, the industry's only PSoC® programmable system-on-chip solutions, analog and PMIC Power Management ICs, CapSense® capacitive touch-sensing controllers, and Wireless BLE Bluetooth® Low-Energy and USB connectivity solutions, Cypress is committed to providing its customers worldwide with consistent innovation, best-in-class support and exceptional system value.

# FMB MB9A110A Series

MB9AF114LA/MA/NA, MB9AF115MA/NA, MB9AF116MA/NA

*Data Sheet (Full Production)*

---

**Notice to Readers:** This document states the current technical specifications regarding the Spansion product(s) described herein. Spansion Inc. deems the products to have been in sufficient production volume such that subsequent versions of this document are not expected to change. However, typographical or specification corrections, or modifications to the valid combinations offered may occur.

## Notice On Data Sheet Designations

SpanSion Inc. issues data sheets with Advance Information or Preliminary designations to advise readers of product information or intended specifications throughout the product life cycle, including development, qualification, initial production, and full production. In all cases, however, readers are encouraged to verify that they have the latest information before finalizing their design. The following descriptions of SpanSion data sheet designations are presented here to highlight their presence and definitions.

### Advance Information

The Advance Information designation indicates that SpanSion Inc. is developing one or more specific products, but has not committed any design to production. Information presented in a document with this designation is likely to change, and in some cases, development on the product may discontinue.

SpanSion Inc. therefore places the following conditions upon Advance Information content:

“This document contains information on one or more products under development at SpanSion Inc. The information is intended to help you evaluate this product. Do not design in this product without contacting the factory. SpanSion Inc. reserves the right to change or discontinue work on this proposed product without notice.”

### Preliminary

The Preliminary designation indicates that the product development has progressed such that a commitment to production has taken place. This designation covers several aspects of the product life cycle, including product qualification, initial production, and the subsequent phases in the manufacturing process that occur before full production is achieved. Changes to the technical specifications presented in a Preliminary document should be expected while keeping these aspects of production under consideration. SpanSion places the following conditions upon Preliminary content:

“This document states the current technical specifications regarding the SpanSion product(s) described herein. The Preliminary status of this document indicates that product qualification has been completed, and that initial production has begun. Due to the phases of the manufacturing process that require maintaining efficiency and quality, this document may be revised by subsequent versions or modifications due to changes in technical specifications.”

### Combination

Some data sheets contain a combination of products with different designations (Advance Information, Preliminary, or Full Production). This type of document distinguishes these products and their designations wherever necessary, typically on the first page, the ordering information page, and pages with the DC Characteristics table and the AC Erase and Program table (in the table notes). The disclaimer on the first page refers the reader to the notice on this page.

### Full Production (No Designation on Document)

When a product has been in production for a period of time such that no changes or only nominal changes are expected, the Preliminary designation is removed from the data sheet. Nominal changes may include those affecting the number of ordering part numbers available, such as the addition or deletion of a speed option, temperature range, package type, or VIO range. Changes may also include those needed to clarify a description or to correct a typographical error or incorrect specification.

SpanSion Inc. applies the following conditions to documents in this category:

“This document states the current technical specifications regarding the SpanSion product(s) described herein. SpanSion Inc. deems the products to have been in sufficient production volume such that subsequent versions of this document are not expected to change. However, typographical or specification corrections, or modifications to the valid combinations offered may occur.”

Questions regarding these document designations may be directed to your local sales office.

# FM3 MB9A110A Series

## ■ DESCRIPTION

The MB9A110A Series are a highly integrated 32-bit microcontroller that target for high-performance and cost-sensitive embedded control applications.

The MB9A110A Series are based on the ARM Cortex-M3 Processor and on-chip Flash memory and SRAM, and peripheral functions, including Motor Control Timers, ADCs and Communication Interfaces (UART, CSIO, I<sup>2</sup>C, LIN).

The products which are described in this data sheet are placed into TYPE1 product categories in " FM3 Family PERIPHERAL MANUAL ".

Note: ARM and Cortex are the registered trademarks of ARM Limited in the EU and other countries.

## ■ FEATURES

### • 32-bit ARM Cortex-M3 Core

- Processor version: r2p1
- Up to 40MHz Frequency Operation
- Integrated Nested Vectored Interrupt Controller (NVIC): 1 NMI (non-maskable interrupt) and 48 peripheral interrupts and 16 priority levels
- 24-bit System timer (Sys Tick): System timer for OS task management

### • On-chip Memories

#### [Flash memory]

- Up to 512 Kbyte
- Read cycle: 0wait-cycle
- Security function for code protection

#### [SRAM]

This Series contain a total of up to 32Kbyte on-chip SRAM. On-chip SRAM is composed of two independent SRAM (SRAM0,SRAM1) . SRAM0 is connected to I-code bus and D-code bus of Cortex-M3 core. SRAM1 is connected to System bus.

- SRAM0: Up to 16 Kbytes
- SRAM1: Up to 16 Kbytes

### • Multi-function Serial Interface (Max 8channels)

- 4 channels with 16steps × 9bit FIFO (ch.4-ch.7), 4 channels without FIFO (ch.0-ch.3)
- Operation mode is selectable from the followings for each channel.
  - UART
  - CSIO
  - LIN
  - I<sup>2</sup>C

#### [UART]

- Full-duplex double buffer
  - Selection with or without parity supported
  - Built-in dedicated baud rate generator
  - External clock available as a serial clock
  - Hardware Flow control : Automatically control the transmission by CTS/RTS (only ch.4)\*
  - Various error detection functions available (parity errors, framing errors, and overrun errors)
- \* : MB9AF111LA, F312LA and F314LA do not support Hardware Flow control

#### [CSIO]

- Full-duplex double buffer
- Built-in dedicated baud rate generator
- Overrun error detection function available

#### [LIN]

- LIN protocol Rev.2.1 supported
- Full-duplex double buffer
- Master/Slave mode supported
- LIN break field generation (can be changed 13-16bit length)
- LIN break delimiter generation (can be changed 1-4bit length)
- Various error detection functions available (parity errors, framing errors, and overrun errors)

#### [I<sup>2</sup>C]

Standard-mode (Max 100kbps) / Fast-mode (Max 400Kbps) supported

- **External Bus Interface\***

- Supports SRAM, NOR Flash device
- Up to 8 chip selects
- 8/16-bit Data width
- Up to 25-bit Address bit
- Maximum area size : Up to 256 Mbytes
- Supports Address/Data multiplex
- Supports external RDY function
- \* : MB9AF111LA, F312LA and F314LA do not support External Bus Interface

- **DMA Controller (8channels)**

The DMA Controller has an independent bus from the CPU, so CPU and DMA Controller can process simultaneously.

- 8 independently configured and operated channels
- Transfer can be started by software or request from the built-in peripherals
- Transfer address area: 32bit(4Gbytes)
- Transfer mode: Block transfer/Burst transfer/Demand transfer
- Transfer data type: byte/half-word/word
- Transfer block count: 1 to 16
- Number of transfers: 1 to 65536

- **A/D Converter (Max 16channels)**

[12-bit A/D Converter]

- Successive Approximation type
- Built-in 3units\*
- Conversion time: 1.0μs@5V
- Priority conversion available (priority at 2levels)
- Scanning conversion mode
- Built-in FIFO for conversion data storage (for SCAN conversion: 16steps, for Priority conversion: 4steps)
- \* : MB9AF111LA, F112LA , F114LA built-in 2units

- **Base Timer (Max 8channels)**

Operation mode is selectable from the followings for each channel.

- 16-bit PWM timer
- 16-bit PPG timer
- 16/32-bit reload timer
- 16/32-bit PWC timer

### • Multi-function Timer (Max 2units)

The Multi-function timer is composed of the following blocks.

- 16-bit free-run timer × 3ch/unit
- Input capture × 4ch/unit
- Output compare × 6ch/unit
- A/D activation compare × 3ch/unit
- Waveform generator × 3ch/unit
- 16-bit PPG timer × 3ch/unit

The following function can be used to achieve the motor control.

- PWM signal output function
- DC chopper waveform output function
- Dead timer function
- Input capture function
- A/D converter activate function
- DTIF (Motor emergency stop) interrupt function

### • Quadrature Position/Revolution Counter (QPRC) (Max 2units)

The Quadrature Position/Revolution Counter (QPRC) is used to measure the position of the position encoder. Moreover, it is possible to use up/down counter.

- The detection edge of the three external event input pins AIN, BIN and ZIN is configurable.
- 16-bit position counter
- 16-bit revolution counter
- Two 16-bit compare registers

### • Dual Timer (32/16bit Down Counter)

The Dual Timer consists of two programmable 32/16-bit down counters. Operation mode is selectable from the followings for each timer channel.

- Free-running
- Periodic (=Reload)
- One-shot

### • Watch Counter

The Watch counter is used for wake up from Low-Power Consumption mode.

- Interval timer: up to 64s(Max)@ Sub Clock : 32.768kHz

### • Watch dog Timer (2channels)

A watchdog timer can generate interrupts or a reset when a time-out value is reached.

This series consists of two different watchdogs, a "Hardware" watchdog and a "Software" watchdog.

The "Hardware" watchdog timer is clocked by the built-in low speed CR oscillator. Therefore, the "Hardware" watchdog is active in any low-power consumption modes except STOP mode.

- **External Interrupt Controller Unit**

- Up to 16 external interrupt input pins.
- Include one non-maskable interrupt (NMI) input pin.

- **General-Purpose I/O Port**

This series can use its pins as general-purpose I/O ports when they are not used for external bus or peripherals. Moreover, the port relocate function is built in. It can set which I/O port the peripheral function can be allocated to.

- Capable of pull-up control per pin
  - Capable of reading pin level directly
  - Built-in the port relocate function
  - Up to 83 fast General Purpose I/O Ports @ 100pin Package
  - Some ports are 5V tolerant I/O (MB9AF115MA/NA, MB9AF116MA/NA only)
- Please see "■PIN DESCRIPTION" to confirm the corresponding pins.

- **CRC (Cyclic Redundancy Check) Accelerator**

The CRC accelerator calculates the CRC which has a heavy software processing load, and achieves a reduction of the integrity check processing load for reception data and storage.

CCITT CRC16 and IEEE-802.3 CRC32 are supported.

- CCITT CRC16 Generator Polynomial: 0x1021
- IEEE-802.3 CRC32 Generator Polynomial: 0x04C11DB7

- **Clock and Reset**

[Clocks]

Selectable from five clock sources (2 external oscillators, 2 built-in CR oscillators, and Main PLL).

- Main Clock : 4MHz to 48MHz
- Sub Clock : 32.768kHz
- Built-in high-speed CR Clock: 4MHz
- Built-in low-speed CR Clock : 100kHz
- Main PLL Clock

[Resets]

- Reset requests from INITX pins
- Power-on reset
- Software reset
- Watchdog timers reset
- Low-voltage detector reset
- Clock supervisor reset

- **Clock Super Visor (CSV)**

Clocks generated by built-in CR oscillators are used to supervise abnormality of the external clocks.

- External clock failure (clock stop) is detected, reset is asserted.
- External frequency anomaly is detected, interrupt or reset is asserted.

- **Low-Voltage Detector (LVD)**

This Series include 2-stage monitoring of voltage on the VCC. When the voltage falls below the voltage that has been set, Low-Voltage Detector generates an interrupt or reset.

- LVD1: error reporting via interrupt
- LVD2: auto-reset operation

- **Low-Power Consumption Mode**

Three Low-Power Consumption modes supported.

- SLEEP
- TIMER
- STOP

- **Debug**

- Serial Wire JTAG Debug Port (SWJ-DP)
- Embedded Trace Macrocells (ETM).\*

\*: MB9AF111LA/MA, F312LA/MA, F314LA/MA, F315MA and F316MA support only SWJ-DP.

- **Power Supply**

- VCC = 2.7V to 5.5V: Correspond to the wide range voltage.

## ■ PRODUCT LINEUP

### • Memory size

| Product name         | MB9AF111LA/MA/NA | MB9AF112LA/MA/NA | MB9AF114LA/MA/NA |
|----------------------|------------------|------------------|------------------|
| On-chip Flash memory | 64Kbytes         | 128Kbytes        | 256Kbytes        |
| On-chip SRAM         | 16Kbytes         | 16Kbytes         | 32Kbytes         |

| Product name         | MB9AF115MA/NA | MB9AF116MA/NA |

Note: All signals of the peripheral function in each product cannot be allocated by limiting the pins of package.  
It is necessary to use the port relocate function of the I/O port according to your function use.  
See "■ ELECTRICAL CHARACTERISTICS 4.AC Characteristics (3)Built-in CR Oscillation Characteristics" for accuracy of built-in CR.

## PIN ASSIGNMENT

### FPT-100P-M23

#### <Note>

The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

## • FPT-100P-M06

## &lt;Note&gt;

The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

## • FPT-80P-M37

## &lt;Note&gt;

The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

## • FPT-64P-M38/M39

## &lt;Note&gt;

The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

## • BGA-112P-M04

## &lt;Note&gt;

The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

## • LCC-64P-M24

## &lt;Note&gt;

The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

## ■ LIST OF PIN FUNCTIONS

### • List of pin numbers

The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin

| Pin No   |         |         |         |                   | Pin name             | I/O circuit type | Pin state type |
|----------|---------|---------|---------|-------------------|----------------------|------------------|----------------|
| LQFP-100 | QFP-100 | BGA-112 | LQFP-80 | LQFP-64<br>QFN-64 |                      |                  |                |
| 1        | 79      | B1      | 1       | 1                 | VCC                  | -                |                |
| 2        | 80      | C1      | 2       | 2                 | P50                  | E                | H              |

\* : 5V tolerant I/O on MB9AF115MA/NA and MB9AF116MA/NA

• List of pin functions

The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

| Module       | Pin name | Function                                                     | Pin No   |         |         |         |                |

| A    | <p>The diagram illustrates a complex I/O circuit for Type A. It features two external pins, X1 and X0. Pin X1 is connected to a pull-up resistor, a P-channel MOSFET (P-ch), and a feedback resistor. Pin X0 is connected to a pull-up resistor, a P-channel MOSFET (P-ch), and an N-channel MOSFET (N-ch). The P-ch MOSFETs are connected to digital outputs. The N-ch MOSFET is connected to ground. The feedback resistor is connected to a digital input. Standby mode control is connected to a digital input and a clock input. Pull-up resistor control is connected to a digital input and a digital output.</p> | <ul style="list-style-type: none"> <li>• It is possible to select the main oscillation / GPIO function</li> </ul> <p>When the main oscillation is selected.</p> <ul style="list-style-type: none"> <li>• Oscillation feedback resistor : Approximately 1M<math>\Omega</math></li> <li>• With Standby mode control</li> </ul> <p>When the GPIO is selected.</p> <ul style="list-style-type: none"> <li>• CMOS level output.</li> <li>• CMOS level hysteresis input</li> <li>• With pull-up resistor control</li> <li>• With standby mode control</li> <li>• Pull-up resistor : Approximately 50k<math>\Omega</math></li> <li>• <math>I_{OH} = -4mA</math>, <math>I_{OL} = 4mA</math></li> </ul> |
| B    | <p>The diagram illustrates a simple I/O circuit for Type B. It features an external pin connected to a pull-up resistor, which is then connected to a digital input through a resistor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                              | <ul style="list-style-type: none"> <li>• CMOS level hysteresis input</li> <li>• Pull-up resistor : Approximately 50k<math>\Omega</math></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## ■ HANDLING PRECAUTIONS

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Spansion semiconductor devices.

### 1. Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

#### Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

#### Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

#### Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

##### (1) Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

##### (2) Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device.

Therefore, avoid this type of connection.

##### (3) Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

#### Latch-up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNP junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

**CAUTION:** The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

- (1) Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
- (2) Be sure that abnormal current flows do not occur during the power-on sequence.

## Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

## Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

## Precautions Related to Usage of Devices

Spansion semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

**CAUTION:** Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

## 2. Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Spansion's recommended conditions. For detailed information about mount conditions, contact your sales representative.

### Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Spansion recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

### Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Spansion recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Spansion ranking of recommended conditions.

## Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

## Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

- (1) Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
- (2) Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.  
When you open Dry Package that recommends humidity 40% to 70% relative humidity.
- (3) When necessary, SpanSion packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
- (4) Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

## Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the SpanSion recommended conditions for baking.

Condition: 125°C/24 h

## Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

- (1) Maintain relative humidity in the working environment between 40% and 70%. Use of an apparatus for ion generation may be needed to remove electricity.
- (2) Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
- (3) Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).  
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
- (4) Ground all fixtures and instruments, or protect with anti-static measures.
- (5) Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

### 3. Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

(1) Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

(2) Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

(3) Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

(4) Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

(5) Smoke, Flame

CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of SpanSion products in other special environmental conditions should consult with sales representatives.

Please check the latest handling precautions at the following URL.

## ■ HANDLING DEVICES

- Power supply pins

In products with multiple VCC and VSS pins, respective pins at the same potential are interconnected within the device in order to prevent malfunctions such as latch-up. However, all of these pins should be connected externally to the power supply or ground lines in order to reduce electromagnetic emission levels, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating.

Moreover, connect the current supply source with each Power supply pin and GND pin of this device at low impedance. It is also advisable that a ceramic capacitor of approximately 0.1  $\mu\text{F}$  be connected as a bypass capacitor between each Power supply pin and GND pin, between AVCC pin and AVSS pin near this device.

- Stabilizing power supply voltage

A malfunction may occur when the power supply voltage fluctuates rapidly even though the fluctuation is within the recommended operating conditions of the VCC power supply voltage. As a rule, with voltage stabilization, suppress the voltage fluctuation so that the fluctuation in VCC ripple (peak-to-peak value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the VCC value in the recommended operating conditions, and the transient fluctuation rate does not exceed 0.1 V/ $\mu\text{s}$  when there is a momentary fluctuation on switching the power supply.

- Crystal oscillator circuit

Noise near the X0/X1 and X0A/X1A pins may cause the device to malfunction. Design the printed circuit board so that X0/X1, X0A/X1A pins, the crystal oscillator, and the bypass capacitor to ground are located as close to the device as possible.

It is strongly recommended that the PC board artwork be designed such that the X0/X1 and X0A/X1A pins are surrounded by ground plane as this is expected to produce stable operation.

Evaluate oscillation of your using crystal oscillator by your mount board.

- Using an external clock

When using an external clock, the clock signal should be driven to the X0,X0A pin only and the X1,X1A pin should be kept open.

- Handling when using Multi function serial pin as I<sup>2</sup>C pin

If it is using the multi function serial pin as I<sup>2</sup>C pins, P-ch transistor of digital output is always disabled. However, I<sup>2</sup>C pins need to keep the electrical characteristic like other pins and not to connect to the external I<sup>2</sup>C bus system with power OFF.

- **C Pin**

This series contains the regulator. Be sure to connect a smoothing capacitor ( $C_s$ ) for the regulator between the C pin and the GND pin. Please use a ceramic capacitor or a capacitor of equivalent frequency characteristics as a smoothing capacitor.

However, some laminated ceramic capacitors have the characteristics of capacitance variation due to thermal fluctuation (F characteristics and Y5V characteristics). Please select the capacitor that meets the specifications in the operating conditions to use by evaluating the temperature characteristics of a capacitor.

A smoothing capacitor of about  $4.7\mu\text{F}$  would be recommended for this series.

- **Mode pins (MD0)**

Connect the MD pin (MD0) directly to VCC or VSS pins. Design the printed circuit board such that the pull-up/down resistor stays low, as well as the distance between the mode pins and VCC pins or VSS pins is as short as possible and the connection impedance is low, when the pins are pulled-up/down such as for switching the pin level and rewriting the Flash memory data. It is because of preventing the device erroneously switching to test mode due to noise.

- **Notes on power-on**

Turn power on/off in the following order or at the same time.

If not using the A/D converter, connect  $\text{AVCC} = \text{VCC}$  and  $\text{AVSS} = \text{VSS}$ .

Turning on :  $\text{VCC} \rightarrow \text{AVCC} \rightarrow \text{AVRH}$

Turning off :  $\text{AVRH} \rightarrow \text{AVCC} \rightarrow \text{VCC}$

- **Serial Communication**

There is a possibility to receive wrong data due to the noise or other causes on the serial communication. Therefore, design a printed circuit board so as to avoid noise.

Consider the case of receiving wrong data due to noise, perform error detection such as by applying a checksum of data at the end. If an error is detected, retransmit the data.

- **Differences in features among the products with different memory sizes and between Flash products and MASK products**

The electric characteristics including power consumption, ESD, latch-up, noise characteristics, and oscillation characteristics among the products with different memory sizes and between Flash products and MASK products are different because chip layout and memory structures are different.

If you are switching to use a different product of the same series, please make sure to evaluate the electric characteristics.

## ■ BLOCK DIAGRAM

\*1: For the MB9AF111LA/MA, F112LA/MA, MB9AF114LA/MA, MB9AF115MA and MB9AF116MA, ETM is not available.

\*2: For the MB9AF111LA, F112LA and MB9AF114LA, the External Bus Interface and 12-bit A/D Converter (unit 2) are not available. And the Multi-function Serial Interface does not support hardware flow control in these products.

**■ MEMORY SIZE**

See "●Memory size" in "■PRODUCT LINEUP" to confirm the memory size.

## ■ MEMORY MAP

### • Memory Map (1)

## • Memory Map (2)

## ■ PIN STATUS IN EACH CPU STATE

The terms used for pin status have the following meanings.

- INITX=0  
This is the period when the INITX pin is the "L" level.
- INITX=1  
This is the period when the INITX pin is the "H" level.
- SPL=0  
This is the status that the standby pin level setting bit (SPL) in the standby mode control register (STB\_CTL) is set to "0".
- SPL=1  
This is the status that the standby pin level setting bit (SPL) in the standby mode control register (STB\_CTL) is set to "1".
- Input enabled  
Indicates that the input function can be used.
- Internal input fixed at "0"  
This is the status that the input function cannot be used. Internal input is fixed at "L".
- Hi-Z  
Indicates that the pin drive transistor is disabled and the pin is put in the Hi-Z state.
- Setting disabled  
Indicates that the setting is disabled.
- Maintain previous state  
Maintains the state that was immediately prior to entering the current mode.  
If a built-in peripheral function is operating, the output follows the peripheral function.  
If the pin is being used as a port, that output is maintained.
- Analog input is enabled  
Indicates that the analog input is enabled.
- Trace output  
Indicates that the trace function can be used.

## • List of Pin Status

| Pin status type | Function group                                       | Power-on reset or low-voltage detection state      | INITX input state                 | Device internal reset state       | Run mode or SLEEP mode state | Timer mode or STOP mode state                                                                 |                                                                                               |
|-----------------|------------------------------------------------------|----------------------------------------------------|-----------------------------------|-----------------------------------|------------------------------|-----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
|                 |                                                      | Power supply unstable                              | Power supply stable               |                                   | Power supply stable          | Power supply stable                                                                           |                                                                                               |
|                 |                                                      | -                                                  | INITX=0                           | INITX=1                           | INITX=1                      | INITX=1                                                                                       |                                                                                               |
|                 |                                                      | -                                                  | -                                 | -                                 | -                            | SPL=0                                                                                         | SPL=1                                                                                         |

| "H" level total maximum output current               | $\Sigma I_{OH}$      | -              | - 100                              | mA   |             |
| "H" level total average output current <sup>*6</sup> | $\Sigma I_{OHAV}$    | -              | - 50                               | mA   |             |
| Power consumption                                    | $P_D$                | -              | 300                                | mW   |             |
| Storage temperature                                  | $T_{STG}$            | - 55           | + 150                              | °C   |             |

\*1 : These parameters are based on the condition that  $V_{SS} = AV_{SS} = 0.0V$ .

\*2 :  $V_{CC}$  must not drop below  $V_{SS} - 0.5V$ .

\*3 : Be careful not to exceed  $V_{CC} + 0.5 V$ , for example, when the power is turned on.

\*4 : The maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

\*5 : The average output current is defined as the average current value flowing through any one of the corresponding pins for a 100 ms period.

\*6 : The total average output current is defined as the average current value flowing through all of corresponding pins for a 100ms.

\*7 :

- See "■LIST OF PIN FUNCTIONS" and "■I/O CIRCUIT TYPE" about +B input available pin.
- Use within recommended operating conditions.
- Use at DC voltage (current) the +B input.
- The +B signal should always be applied a limiting resistance placed between the +B signal and the device.
- The value of the limiting resistance should be set so that when the +B signal is applied the input current to the device pin does not exceed rated values, either instantaneously or for prolonged periods.
- Note that when the device drive current is low, such as in the low-power consumption modes, the +B input potential may pass through the protective diode and increase the potential at the VCC and AVCC pin, and this may affect other devices.
- Note that if a +B signal is input when the device power supply is off (not fixed at 0V), the power supply is provided from the pins, so that incomplete operation may result.
- The following is a recommended circuit example (I/O equivalent circuit).

#### <WARNING>

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

## 2. Recommended Operating Conditions

(V<sub>SS</sub> = AV<sub>SS</sub> = 0.0V)

\*1 : See " · C Pin" in "■HANDLING DEVICES" for the connection of the smoothing capacitor.

\*2 : In between less than the minimum power supply voltage and low voltage reset/interrupt detection voltage or more, instruction execution and low voltage detection function by built-in High-speed CR(including Main PLL is used) or built-in Low-speed CR is possible to operate only.

### <WARNING>

The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

### 3. DC Characteristics

#### • Current rating

(V<sub>cc</sub> = AV<sub>cc</sub> = 2.7V to 5.5V, V<sub>ss</sub> = AV<sub>ss</sub> = 0V, Ta = - 40°C to + 105°C)

|                                                                      |                     | Min   | Typ | Max |          |         |
| PLL oscillation stabilization wait time (LOCK UP time)* <sup>1</sup> | t <sub>LOCK</sub>   | 100   | -   | -   | μs       |         |
| PLL input clock frequency                                            | f <sub>PLLI</sub>   | 4     | -   | 16  | MHz      |         |
| PLL multiple rate                                                    | -                   | 13    | -   | 75  | multiple |         |
| PLL macro oscillation clock frequency                                | f <sub>PLLO</sub>   | 200   | -   | 300 | MHz      |         |
| Main PLL clock frequency* <sup>2</sup>                               | F <sub>CLKPLL</sub> | -     | -   | 40  | MHz      |         |

\*1 : Time from when the PLL starts operating until the oscillation stabilizes.

\*2 : For more information about Main PLL clock (CLKPLL), see "CHAPTER 2-1: Clock" in "FM3 Family PERIPHERAL MANUAL".

## (4-2) Operating Conditions of Main PLL (In the case of using the built-in high speed CR for the input clock of the main PLL)

(V<sub>CC</sub> = 2.7V to 5.5V, V<sub>SS</sub> = 0V, T<sub>a</sub> = - 40°C to + 105°C)

| Parameter                                                            | Symbol              | Value |     |     | Unit     | Remarks |
|----------------------------------------------------------------------|---------------------|-------|-----|-----|----------|---------|
|                                                                      |                     | Min   | Typ | Max |          |         |
| PLL oscillation stabilization wait time (LOCK UP time)* <sup>1</sup> | t <sub>LOCK</sub>   | 100   | -   | -   | μs       |         |
| PLL input clock frequency                                            | f <sub>PLLI</sub>   | 3.8   | 4   | 4.2 | MHz      |         |
| PLL multiple rate                                                    | -                   | 50    | -   | 71  | multiple |         |
| PLL macro oscillation clock frequency                                | f <sub>PLLO</sub>   | 190   | -   | 300 | MHz      |         |
| Main PLL clock frequency* <sup>2</sup>                               | F <sub>CLKPLL</sub> | -     | -   | 40  | MHz      |         |

\*1 : Time from when the PLL starts operating until the oscillation stabilizes.

\*2 : For more information about Main PLL clock (CLKPLL), see "CHAPTER 2-1: Clock" in "FM3 Family PERIPHERAL MANUAL".

When setting PLL multiple rate, please take the accuracy of the built-in high-speed CR clock into account and prevent the master clock from exceeding the maximum frequency.

(5) Reset Input Characteristics

(V<sub>CC</sub> = 2.7V to 5.5V, V<sub>SS</sub> = 0V, Ta = - 40°C to + 105°C)

| Parameter        | Symbol             | Pin name | Conditions | Value |     | Unit | Remarks |
|------------------|--------------------|----------|------------|-------|-----|------|---------|
|                  |                    |          |            | Min   | Max |      |         |
| Reset input time | t <sub>INITX</sub> | INITX    | -          | 500   | -   | ns   |         |

(6) Power-on Reset Timing

(V<sub>CC</sub> = 2.7V to 5.5V, V<sub>SS</sub> = 0V, Ta = - 40°C to + 105°C)

| Parameter                           | Symbol | Pin name        | Value |       | Unit | Remarks |
|-------------------------------------|--------|-----------------|-------|-------|------|---------|
|                                     |        |                 | Min   | Max   |      |         |
| Power supply rising time            | Tr     | V <sub>CC</sub> | 0     | -     | ms   |         |
| Power supply shut down time         | Toff   |                 | 1     | -     | ms   |         |
| Time until releasing Power-on reset | Tprt   |                 | 0.446 | 0.744 | ms   |         |

Glossary

- V<sub>CC\_minimum</sub> : Minimum V<sub>CC</sub> of recommended operating conditions
- V<sub>DH\_minimum</sub> : Minimum release voltage of Low-Voltage detection reset.  
See "8. Low-Voltage Detection Characteristics"

### (7) External Bus Timing

#### • External bus clock output Characteristics

( $V_{CC} = 2.7V$  to  $5.5V$ ,  $V_{SS} = 0V$ ,  $T_a = -40^{\circ}C$  to  $+105^{\circ}C$ )

| Parameter                | Symbol             | Pin name | Conditions              | Value |     | Unit |
|--------------------------|--------------------|----------|-------------------------|-------|-----|------|
|                          |                    |          |                         | Min   | Max |      |
| Output frequency         | t <sub>CYCLE</sub> | MCLKOUT  | V <sub>CC</sub> ≥ 4.5 V | -     | 40  | MHz  |
|                          |                    |          | V <sub>CC</sub> < 4.5 V | -     | 32  | MHz  |
| Minimum clock cycle time | -                  |          | V <sub>CC</sub> ≥ 4.5 V | 25    | -   | ns   |
|                          |                    |          | V <sub>CC</sub> < 4.5 V | 31.25 | -   | ns   |

Note: The external bus clock output is a divided clock of HCLK. For more information about setting of clock divider, see "CHAPTER 12: External Bus Interface" in "FM3 Family PERIPHERAL MANUAL"

When external bus clock is not output, this characteristic does not give any effect on external bus operation.

#### • External bus signal input/output Characteristics

( $V_{CC} = 2.7V$  to  $5.5V$ ,  $V_{SS} = 0V$ ,  $T_a = -40^{\circ}C$  to  $+105^{\circ}C$ )

| Parameter                     | Symbol   | Conditions | Value               | Unit | Remarks |
|-------------------------------|----------|------------|---------------------|------|---------|
| Signal input characteristics  | $V_{IH}$ | -          | $0.8 \times V_{CC}$ | V    |         |
|                               | $V_{IL}$ |            | $0.2 \times V_{CC}$ | V    |         |
| Signal output characteristics | $V_{OH}$ |            | $0.8 \times V_{CC}$ | V    |         |
|                               | $V_{OL}$ |            | $0.2 \times V_{CC}$ | V    |         |

• Separate Bus Access Asynchronous SRAM Mode

(V<sub>CC</sub> = 2.7V to 5.5V, V<sub>SS</sub> = 0V, T<sub>a</sub> = - 40°C to + 105°C)

| Parameter                             | Symbol                   | Pin name               | Conditions                                       | Value                 |                       | Unit |
|---------------------------------------|--------------------------|------------------------|--------------------------------------------------|-----------------------|-----------------------|------|
|                                       |                          |                        |                                                  | Min                   | Max                   |      |

- Notes:
- The above characteristics apply to CLK synchronous mode.
  - t<sub>CYCP</sub> indicates the APB bus clock cycle time.  
About the APB bus number which Multi-function Serial is connected to, see "■BLOCK DIAGRAM" in this data sheet.
  - These characteristics only guarantee the same relocate port number.  
For example, the combination of SCKx\_0 and SOTx\_1 is not guaranteed.
  - When the external load capacitance C<sub>L</sub> = 30pF.

\*1 : R and C represent the pull-up resistance and load capacitance of the SCL and SDA lines, respectively.

V<sub>p</sub> indicates the power supply voltage of the pull-up resistance and I<sub>OL</sub> indicates V<sub>OL</sub> guaranteed current.

\*2 : The maximum t<sub>HDDAT</sub> must satisfy that it doesn't extend at least "L" period (t<sub>LOW</sub>) of device's SCL signal.

\*3 : Fast-mode I<sup>2</sup>C bus device can be used on Standard-mode I<sup>2</sup>C bus system as long as the device satisfies the requirement of "t<sub>SUDAT</sub> ≥ 250 ns".

\*4 : t<sub>CYCP</sub> is the APB bus clock cycle time.

About the APB bus number that I2C is connected to, see "■BLOCK DIAGRAM" in this data sheet.

To use Standard-mode, set the APB bus clock at 2 MHz or more.

To use Fast-mode, set the APB bus clock at 8 MHz or more.

## (13) ETM timing

(V<sub>CC</sub> = 2.7V to 5.5V, V<sub>SS</sub> = 0V, T<sub>a</sub> = - 40°C to + 105°C)

| Parameter                 | Symbol        | Pin name                | Conditions             | Value |     | Unit | Remarks |
|---------------------------|---------------|-------------------------|------------------------|-------|-----|------|---------|
|                           |               |                         |                        | Min   | Max |      |         |

\*1 : The conversion time is the value of sampling time (T<sub>s</sub>) + compare time (T<sub>c</sub>).

The condition of the minimum conversion time is the following.

AV<sub>cc</sub> ≥ 4.5V, HCLK=40MHz sampling time: 300ns, compare time: 700ns

AV<sub>cc</sub> < 4.5V, HCLK=40MHz sampling time: 500ns, compare time: 700ns

Ensure that it satisfies the value of the sampling time (T<sub>s</sub>) and compare clock cycle (T<sub>ck</sub>).

For setting of the sampling time and compare clock cycle, see "CHAPTER 1-1: A/D Converter" in "FM3 Family PERIPHERAL MANUAL Analog Macro Part".

The A/D Converter register is set at APB bus clock timing. The sampling clock and compare clock are set at Base clock (HCLK).

About the APB bus number which the A/D Converter is connected to, see "■BLOCK DIAGRAM" in this data sheet.

\*2 : A necessary sampling time changes by external impedance.

Ensure that it set the sampling time to satisfy (Equation 1)

\*3 : The compare time (T<sub>c</sub>) is the value of (Equation 2)

(Equation 1)  $T_s \geq (R_{AIN} + R_{ext}) \times C_{AIN} \times 9$

$T_s$  : Sampling time

$R_{AIN}$  : input resistor of A/D = 2k $\Omega$        $4.5 \leq AV_{CC} \leq 5.5$

input resistor of A/D = 3.8k $\Omega$        $2.7 \leq AV_{CC} < 4.5$

$C_{AIN}$  : input capacity of A/D = 12.9pF       $2.7 \leq AV_{CC} \leq 5.5$

$R_{ext}$  : Output impedance of external circuit

(Equation 2)  $T_c = T_{cck} \times 14$

$T_c$  : Compare time

$T_{cck}$  : Compare clock cycle

• Definition of 12-bit A/D Converter Terms

- Resolution : Analog variation that is recognized by an A/D converter.
- Integral Nonlinearity : Deviation of the line between the zero-transition point (0b000000000000 ↔ 0b000000000001) and the full-scale transition point (0b111111111110 ↔ 0b111111111111) from the actual conversion characteristics.
- Differential Nonlinearity : Deviation from the ideal value of the input voltage that is required to change the output code by 1 LSB.

## 6. Low-voltage detection characteristics

### • Low-voltage detection reset

(Ta = - 40°C to + 105°C)

| Parameter        | Symbol | Conditions | Value |      |      | Unit | Remarks            |
|------------------|--------|------------|-------|------|------|------|--------------------|
|                  |        |            | Min   | Typ  | Max  |      |                    |
| Detected voltage | VDL    | -          | 2.25  | 2.45 | 2.65 | V    | When voltage drops |
| Released voltage | VDH    | -          | 2.30  | 2.50 | 2.70 | V    | When voltage rises |

### • Interrupt of low-voltage detection

(Ta = - 40°C to + 105°C)

| Parameter                   | Symbol            | Conditions  | Value |     |                          | Unit | Remarks            |

\* : t<sub>CYCP</sub> indicates the APB2 bus clock cycle time.

## 7. Flash Memory Write/Erase Characteristics

### (1) Write / Erase time

(V<sub>CC</sub> = 2.7V to 5.5V, T<sub>a</sub> = - 40°C to + 105°C)

| Parameter                     |                   | Value |      | Unit | Remarks                                     |
|-------------------------------|-------------------|-------|------|------|---------------------------------------------|
|                               |                   | Typ*  | Max* |      |                                             |
| Sector erase time             | Large Sector      | 0.7   | 3.7  | s    | Includes write time prior to internal erase |
|                               | Small Sector      | 0.3   | 1.1  |      |                                             |
| Half word (16 bit) write time |                   | 12    | 384  | μs   | Not including system-level overhead time.   |
| Chip erase time               | 64K/128K/256KByte | 5.2   | 23.6 | s    | Includes write time prior to internal erase |
|                               | 384K/512KByte     | 8     | 38.4 | s    |                                             |

\* : The typical value is immediately after shipment, the maximum value is guarantee value under 100,000 cycle of erase/write.

### (2) Erase/write cycles and data hold time

| Erase/write cycles (cycle) | Data hold time (year) | Remarks |
|----------------------------|-----------------------|---------|
| 1,000                      | 20*                   |         |
| 10,000                     | 10*                   |         |
| 100,000                    | 5*                    |         |

\* : At average + 85°C

## 8. Return Time from Low-Power Consumption Mode

### (1) Return Factor: Interrupt

The return time from Low-Power consumption mode is indicated as follows. It is from receiving the return factor to starting the program operation.

- Return Count Time

( $V_{CC} = 2.7V$  to  $5.5V$ ,  $T_a = -40^{\circ}C$  to  $+105^{\circ}C$ )

| Parameter                                                       | Symbol | Value      |      | Unit    | Remarks |
|-----------------------------------------------------------------|--------|------------|------|---------|---------|
|                                                                 |        | Typ        | Max* |         |         |
| SLEEP mode                                                      | Ticnt  | $t_{CYCC}$ |      | ns      |         |
| High-speed CR TIMER mode,<br>Main TIMER mode,<br>PLL TIMER mode |        | 40         | 80   | $\mu s$ |         |
| Low-speed CR TIMER mode                                         |        | 453        | 737  | $\mu s$ |         |
| Sub TIMER mode                                                  |        | 453        | 737  | $\mu s$ |         |
| STOP mode                                                       |        | 453        | 737  | $\mu s$ |         |

\* : The maximum value depends on the accuracy of built-in CR.

- Operation example of return from Low-Power consumption mode (by external interrupt\*)

\* : External interrupt is set to detecting fall edge.

- Operation example of return from Low-Power consumption mode (by internal resource interrupt\*)

\* : Internal resource interrupt is not included in return factor by the kind of Low-Power consumption mode.

- Notes:
- The return factor is different in each Low-Power consumption modes. See "CHAPTER 6: Low Power Consumption Mode" and "Operations of Standby Modes" in FM3 Family PERIPHERAL MANUAL about the return factor from Low-Power consumption mode.
  - When interrupt recovers, the operation mode that CPU recovers depends on the state before the Low-Power consumption mode transition. See "CHAPTER 6: Low Power Consumption Mode" in "FM3 Family PERIPHERAL MANUAL".

(2) Return Factor: Reset

The return time from Low-Power consumption mode is indicated as follows. It is from releasing reset to starting the program operation.

- Return Count Time

( $V_{CC} = 2.7V$  to  $5.5V$ ,  $T_a = -40^{\circ}C$  to  $+105^{\circ}C$ )

| Parameter                                                       | Symbol | Value |      | Unit | Remarks |
|-----------------------------------------------------------------|--------|-------|------|------|---------|
|                                                                 |        | Typ   | Max* |      |         |
| SLEEP mode                                                      | Trcnt  | 308   | 444  | μs   |         |
| High-speed CR TIMER mode,<br>Main TIMER mode,<br>PLL TIMER mode |        | 308   | 444  | μs   |         |
| Low-speed CR TIMER mode                                         |        | 428   | 684  | μs   |         |
| Sub TIMER mode                                                  |        | 428   | 684  | μs   |         |
| STOP mode                                                       |        | 428   | 684  | μs   |         |

\* : The maximum value depends on the accuracy of built-in CR.

- Operation example of return from Low-Power consumption mode (by INITX)

- Operation example of return from low power consumption mode (by internal resource reset\*)

\*: Internal resource reset is not included in return factor by the kind of Low-Power consumption mode.

- Notes:
- The return factor is different in each Low-Power consumption modes. See "CHAPTER 6: Low Power Consumption Mode" and "Operations of Standby Modes" in FM3 Family PERIPHERAL MANUAL.
  - When interrupt recoveries, the operation mode that CPU recoveries depends on the state before the Low-Power consumption mode transition. See "CHAPTER 6: Low Power Consumption Mode" in "FM3 Family PERIPHERAL MANUAL".
  - The time during the power-on reset/low-voltage detection reset is excluded. See "(6) Power-on Reset Timing in 4. AC Characteristics in ■ELECTRICAL CHARACTERISTICS" for the detail on the time during the power-on reset/low -voltage detection reset.
  - When in recovery from reset, CPU changes to the high-speed CR run mode. When using the main clock or the PLL clock, it is necessary to add the main clock oscillation stabilization wait time or the main PLL clock stabilization wait time.
  - The internal resource reset means the watchdog reset and the CSV reset.

64-pin plastic LQFP  
(FPT-64P-M38)

Note 1) \* : These dimensions do not include resin protrusion.  
 Note 2) Pins width and pins thickness include plating thickness.  
 Note 3) Pins width do not include tie bar cutting remainder.

| 53     | ■BLOCK DIAGRAM                                                                                      | Modified the block diagram                                                                                                                                                                                                                                |
| 54     | ■MEMORY SIZE                                                                                        | Changed to the following description<br>See "●Memory size" in "■PRODUCT LINEUP" to confirm the memory size.                                                                                                                                               |
| 55     | ■MEMORY MAP<br>· Memory map(1)                                                                      | Modified the area of "External Device Area"                                                                                                                                                                                                               |
| 56, 57 | ■MEMORY MAP<br>· Memory map(2)(3)                                                                   | Added the summary of Flash memory sector and the note                                                                                                                                                                                                     |
| 64, 65 | ■ELECTRICAL CHARACTERISTICS<br>1. Absolute Maximum Ratings                                          | · Added the Clamp maximum current<br>· Added the output current of P80 and P81<br>· Added about +B input                                                                                                                                                  |
| 66     | ■ELECTRICAL CHARACTERISTICS<br>2. Recommended Operation Conditions                                  | · Modified the minimum value of Analog reference voltage<br>· Added Smoothing capacitor<br>· Added the note about less than the minimum power supply voltage                                                                                              |
| 67, 68 | ■ELECTRICAL CHARACTERISTICS<br>3. DC Characteristics<br>(1) Current rating                          | · Changed the table format<br>· Added Main TIMER mode current<br>· Added Flash Memory Current<br>· Moved A/D Converter Current                                                                                                                            |
| 71     | ■ELECTRICAL CHARACTERISTICS<br>4. AC Characteristics<br>(3) Built-in CR Oscillation Characteristics | Added Frequency stability time at Built-in high-speed CR                                                                                                                                                                                                  |
| 72     | ■ELECTRICAL CHARACTERISTICS<br>4. AC Characteristics<br>(4-1)(4-2) Operating Conditions of Main PLL | · Added Main PLL clock frequency<br>· Added the figure of Main PLL connection                                                                                                                                                                             |
| 73     | ■ELECTRICAL CHARACTERISTICS<br>4. AC Characteristics<br>(6) Power-on Reset Timing                   | · Added Time until releasing Power-on reset<br>· Changed the figure of timing                                                                                                                                                                             |
| 75-77  | ■ELECTRICAL CHARACTERISTICS<br>4. AC Characteristics<br>(7) External Bus Timing                     | Modified Data output time                                                                                                                                                                                                                                 |
| 82-89  | ■ELECTRICAL CHARACTERISTICS<br>4. AC Characteristics<br>(8) CSIO/UART Timing                        | · Modified from UART Timing to CSIO/UART Timing<br>· Changed from Internal shift clock operation to Master mode<br>· Changed from External shift clock operation to Slave mode                                                                            |
| 96     | ■ELECTRICAL CHARACTERISTICS<br>5. 12bit A/D Converter                                               | · Added the typical value of Integral Nonlinearity, Differential Nonlinearity, Zero transition voltage and Full-scale transition voltage<br>· Modified Stage transition time to operation permission<br>· Modified the minimum value of Reference voltage |
| 101    | ■ELECTRICAL CHARACTERISTICS<br>9. Return Time from Low-Power Consumption Mode                       | Added Return Time from Low-Power Consumption Mode                                                                                                                                                                                                         |
| 105    | ■ORDERING INFORMATION                                                                               | Change to full part number                                                                                                                                                                                                                                |
| 106    | ■PACKAGE DIMENSIONS                                                                                 | Deleted FPT-64P-M24, FPT-64P-M23, FPT-80P-M21, FPT-100P-M20                                                                                                                                                                                               |

**Colophon**

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for any use that includes fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for any use where chance of failure is intolerable (i.e., submersible repeater and artificial satellite). Please note that Spansion will not be liable to you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products. Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions. If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the US Export Administration Regulations or the applicable laws of any other country, the prior authorization by the respective government entity will be required for export of those products.
