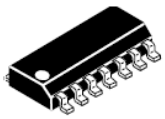
Dual High-speed CAN Transceiver

The CM0902 is a SMARTMOS dual high-speed (up to 1 Mbit/s) CAN transceiver device, providing the physical interface between the CAN protocol controller of an MCU and the physical dual wire CAN bus. Both channels are completely independent, featuring CAN bus wake-up on each CAN interface, and TXD dominant timeout functionality (33CM0902 only).

The CM0902 is packaged in a 14-pin SOIC, with industry standard pin out, and offers excellent EMC and ESD performance without the need for external filter components.The CM0902 comes in two variants: 33CM0902 and 34CM0902 for Automotive and Industrial applications respectively.

CM0902

CAN HIGH-SPEED TRANSCEIVER



EF SUFFIX (PB-FREE)
98ASB42565B
14-PIN SOICN

Features

- Very low-current consumption in standby mode
- Compatible with +3.3 V or +5.0 V MCU interface
- Standby mode with remote CAN wake-up
- Pin and function compatible with market standard

Cost efficient robustness:

- High system level ESD performance
- Very high electromagnetic immunity and low electromagnetic emission without common mode choke or other external components.

Fail-safe behaviors:

- TXD Dominant timeout (33CM0902 only)
- Ideal passive behavior when unpowered, CAN bus leakage current <10 μA.
- V_{DD} and V_{IO} monitoring

Automotive Applications (33CM0902)

- Supports automotive CAN high-speed applications
- Body electronics
- Power train
- Chassis and safety
- Infotainment
- Diagnostic equipment
- Accessories

Industrial Applications (34CM0902)

- Transportation
- Backplanes
- Lift/elevators
- Factory automation
- Industrial process control

Table of Contents

1 Orderable Parts

This section describes the part numbers available to be purchased along with their differences.

Table 1. Orderable Part Variations

Part Number [1]	Temperature (T_A)	Package	TXD dominant protection
MC33CM0902WEF	-40 °C to 125 °C	SOIC 14 pins	Available
MC34CM0902WEF	-40 °C to 85 °C		Not Available

Notes
1. To Order parts in Tape & Reel, add the R2 suffix to the part number.

Valid orderable part numbers are provided on the web. To determine the orderable part numbers for this device, go to http://www.freescale.com and perform a part number search.

3 Pin Connections

3.1 Pinout

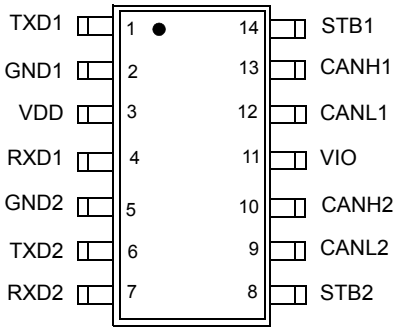

Figure 1. 14-Pin SOIC Pinout

3.2 Pin Definitions

A functional description of each pin can be found in the Functional Pin Description section beginning on page 15.

Table 2. CM0902 Pin Definitions

Pin Number	Pin Name	Pin Function	Definition
1	TXD1	Input	CAN1 bus transmit data pin
2	GND1	Ground	Ground 1
3	VDD	Input	5.0 V input supply for CAN driver and receiver
4	RXD1	Output	CAN1 bus receive data pin
5	GND2	Ground	Ground 2
6	TXD2	Input	CAN2 bus transmit data pin
7	RXD2	Output	CAN2 bus receive data pin
8	STB2	Input	Standby input for CAN2 mode selection
9	CANL2	Input/Output	CAN2 low pin
10	CANH2	Input/Output	CAN2 high pin
11	VIO	Input	Input supply for the digital input output pins
12	CAN L1	Input/Output	CAN1 low pin
13	CAN H1	Input/Output	CAN1 high pin
14	STB1	Input	Standby input for CAN1 mode selection

4 General Product Characteristics

4.1 Maximum Ratings

Table 3. Maximum Ratings

All voltages are with respect to ground unless otherwise noted. Exceeding these ratings may cause a malfunction or permanent damage to the device.

Symbol	Description (Rating)	Min.	Max.	Unit	Notes
ELECTRICAL RATINGS					
V_{DD}	V_{DD} Logic Supply Voltage		7.0	V	
V_{IO}	Input/Output Logic Voltage		7.0	V	
V_{STB1} V_{STB2}	Standby pin Input Voltage		7.0	V	
V_{TXD1} V_{TXD2}	TXD Maximum Voltage Range		7.0	V	
V_{RXD1} V_{RXD2}	RXD Maximum Voltage Range		7.0	V	
V_{CANH1} V_{CANH2}	CANH Bus Pin Maximum Range	-40	40	V	
V_{CANL1} V_{CANL2}	CANL Bus Pin Maximum Range	-40	40	V	
V_{ESD}	ESD Voltage • Human Body Model (HBM) (all pins except CANHx and CANLx pins) • Human Body Model (HBM) (CANHx, CANLx pins) • Machine Model (MM) • Charge Device Model (CDM) (corner pins) • System level ESD • 330 Ω / 150 pF unpowered according to IEC61000-4-2: • 330 Ω / 150 pF unpowered according to OEM LIN, CAN, FLexray Conformance • 2.0 kΩ / 150 pF unpowered according to ISO10605.2008 • 2.0 kΩ / 330 pF powered according to ISO10605.2008		V ±2000 ±8000 ±200 ±500(±750) kV 10 10 10 8.0		(2)

Notes

2. ESD testing is performed in accordance with the Human Body Model (HBM) (C_{ZAP} = 100 pF, R_{ZAP} = 1500 Ω), the Machine Model (MM) (C_{ZAP} = 200 pF, R_{ZAP} = 0 Ω), and the Charge Device Model.

4.2 Thermal Characteristics

Table 4. Thermal Ratings

Symbol	Description (Rating)	Min.	Typ.	Max.	Unit	Notes
THERMAL RATINGS						
T_A T_J	Operating Temperature • Ambient • Junction	 -40 -40		 125 150	°C	
T_{STG}	Storage Temperature	-55		150	°C	
T_{PPRT}	Peak Package Reflow Temperature During Reflow	–		–	°C	
THERMAL RESISTANCE AND PACKAGE DISSIPATION RATINGS						
$R_{\theta JA}$	Junction-to-Ambient, Natural Convection, Single-layer Board	–		140	°C/W	
T_{SD}	Thermal Shutdown		185	–	°C	
T_{SDH}	Thermal Shutdown Hysteresis	–	10		°C	

4.3 Electrical Characteristics

4.3.1 Static Electrical Characteristics

Table 5. Static Electrical Characteristics

Characteristics noted under conditions 4.5 V ≤ V_{DD} ≤ 5.5 V, 2.8 V ≤ V_{IO} ≤ 5.5 V, -40 °C ≤ T_A ≤ 125 °C, GND = 0.0 V, R on CANx bus (R_L) = 60 Ω, unless otherwise noted. Typical values noted reflect the approximate parameter at T_A = 25 °C under nominal conditions, unless otherwise noted.

4.4 Operating Conditions

This section describes the operating conditions of the device. Conditions apply to all the following data, unless otherwise noted.

Table 7. Operating Conditions

All voltages are with respect to ground unless otherwise noted. Exceeding these ratings may cause a malfunction or permanent damage to the device.

Symbol	Ratings	Min.	Max.	Unit	Notes
V_{DD_F}	Functional Operating V_{DD} voltage	V_{DD_UV}	7.0	V	(6)
V_{DD_OP}	Parametric Operating V_{DD} voltage	4.5	5.5	V	
V_{IO_F}	Functional Operating V_{IO} voltage	V_{IO_UV}	7.0	V	(6)
V_{IO_OP}	Parametric Operating V_{IO} voltage	2.8	5.5	V	

Notes

6. Functional operating voltage is defined as device functional or CAN in recessive state

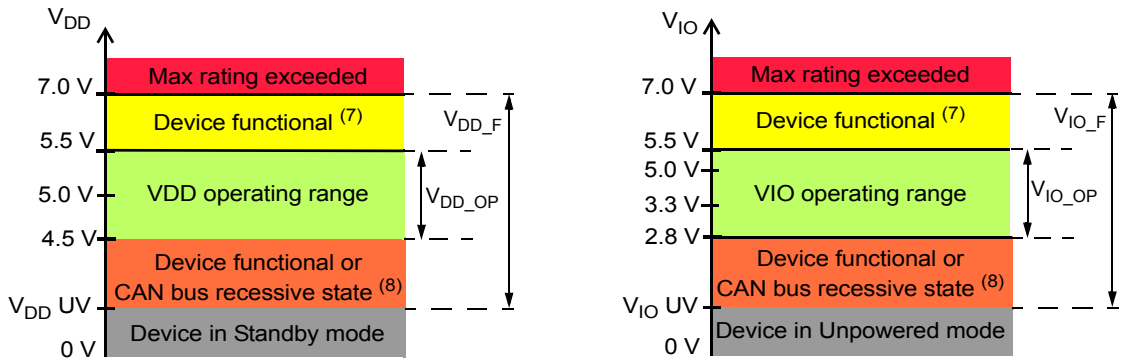

Figure 8. Supply Voltage Operating Range

Notes

7. **Device functional**: Device can operate in this voltage range without damage. Electrical characteristics are not fully guaranteed in this range.
8. **Device functional or CAN bus recessive state**: Device is either functional (see Note 1), or is maintained in recessive state. No false dominant state on CAN bus; dominant state is only controlled by TXDx low level.

5 General IC Functional Description and Application Information

The CM0902 is a SMARTMOS two channel high-speed CAN transceiver, providing the physical interface between the CAN protocol controller of an MCU and the physical two-wire CAN bus, featuring CAN bus wake-up on each CAN channel and TXD dominant timeout (33CM0902 version only). The two CAN physical layers are packaged in a 14-pin SOIC with market standard pin out, and offer excellent EMC and ESD performance without the need for external filter components. These meet the ISO 11898-2 and ISO11898-5 standards, and provide low leakage on CAN bus while unpowered.

The device is supplied from VDD, while VIO allows automatic operation with 5.0 V and 3.3 V microcontrollers interface.

5.1 Features

- Very low current consumption in standby mode
- Automatic adaptation to 3.3 V or 5.0 V MCU communication
- Standby mode with remote CAN wake-up
- Pin and function compatible with market standard
- Cost efficient robustness:
  - High system level ESD performance
  - Very high electromagnetic Immunity and low electromagnetic emission without common mode choke or other external components.
- Fail-safe behaviors:
  - TXD Dominant timeout (33CM0902 only)
  - Ideal passive behavior when unpowered, CAN bus leakage current <10 μA.
- V_{DD} and V_{IO} monitoring

5.2 Functional Block Diagram

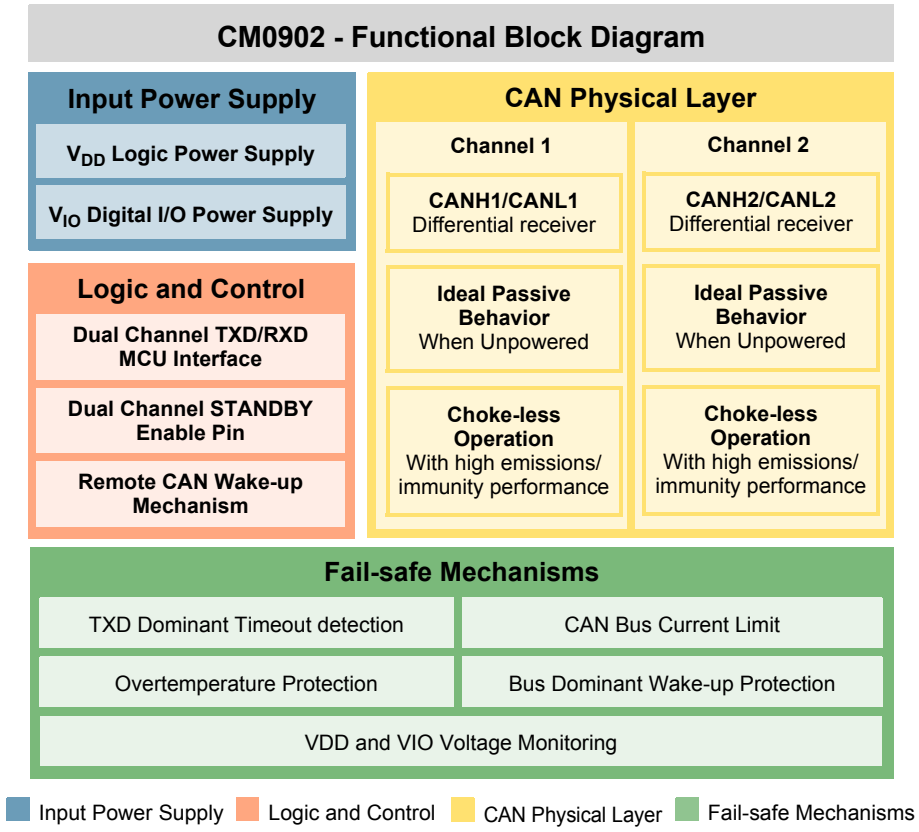

Figure 9. Functional Block Diagram

5.3 Functional Description

5.3.1 V_{DD} Power Supply

This is the supply for the CANHx and CANLx bus drivers, the bus differential receiver and the bus biasing voltage circuitry. V_{DD} is monitored for undervoltage conditions. See Fail-safe Mechanisms.

When the device is in standby mode, the consumption on VDD is extremely low (Refer to IVDD).

5.3.2 V_{IO} Digital I/O Power Supply

This is the supply for the TXDx, RXDx, and STBx digital input outputs pins. V_{IO} also supplies the low power differential wake-up receivers and filter circuitry. This allows detecting and reporting bus wake-up events with device supplied only from V_{IO}. V_{IO} is monitored for undervoltage conditions. See Fail-safe Mechanisms.

When the device is in Standby mode, the consumption on V_{IO} is extremely low (Refer to IVIO).

5.3.3 STB1 and STB2

STBx are the input pins to control the CANx interface mode. When STBx is high or floating, the respective CANx interface is in Standby mode. When STBx is low, the CANx interface is set in Normal mode. STBx has an internal pull-up to the VIO pin, so if STBx is left open, the CANx is set to the predetermined Standby mode.

5.3.4 TXD1 and TXD2

TXDx is the device input pin to control the CANx bus level. In the application, this pin is connected to one of the microcontroller's transmit pins. When TXDx is high or floating, the CANHx and CANLx drivers are OFF in Normal mode, setting the bus in a recessive state. When TXDx is low, the CANHx and CANLx drivers are activated and the bus is set to a dominant state. TXDx has a built-in timing protection on the 33CM0902 version, which disables the bus when TXDx is dominant for more than tX_{DOM}.

In Standby mode, TXDx has no effect on the respective CANx interface.

5.3.5 RXD1 and RXD2

RXDx is the bus output level report pin. This pin connects to one of the microcontroller's receive pins in the application. RXDx is a push-pull structure in Normal mode. When the respective CANx bus is in a recessive state, RXDx is high, and low when the bus is dominant.

In Standby mode, the push-pull structure is disabled, RXDx is pulled up to VIO via a resistor ($R_{PU-RXD1}$), and is in a high level. When the bus wake-up is detected, the push-pull structure resumes and RXDx reports a wake-up via a toggling mechanism (refer to Figure 5).

5.3.6 CANH1 / CANL1 and CANH2 / CANL2

These are the CAN bus pins and each channel 1 or 2 is fully independent from each other. CANLx is a low-side driver to GND, and CANHx is a high-side driver to VDD. In Normal mode and TXDx high, the CANHx and CANLx drivers are OFF, and the voltage at CANHx and CANLx is approx. 2.5 V, provided by the internal bus biasing circuitry. When TXDx is low, CANLx is pulled to GND and CANHx to VDD, creating a differential voltage on the CAN bus.

CANHx and CANLx drivers are OFF in Standby mode, and pulled to GND via the CANx interface R_{IN} resistors (ref to parameter Input Resistance). CANHx and CANLx are high-impedance with extremely low leakage to GND in device unpowered mode, making the device ideally passive when unpowered. CANHx and CANLx have integrated ESD protection and extremely high robustness versus external disturbance, such as EMC and electrical transients. These pins have current limitation and thermal protection.

6 Functional Operation

6.1 Operating Modes

The CM0902 provides two CAN, each one capable of independently operating in two modes: Standby and Normal.

6.1.1 Normal Mode

This mode is selected when the STBx pin is low. In this mode, the device is able to transmit information from TXDx to the bus and report the bus level on the RXDx pin. When TXDx is high, CANHx and CANLx drivers are off and the bus is in the recessive state (unless it is in an application where another device drives the bus to the dominant state). When TXDx is low, CANHx and CANLx drivers are ON and the bus is in the dominant state.

6.1.2 Standby Mode

This mode is selected when the STBx pin is high or floating. The device is not able to transmit information from TXDx to the bus and it cannot report accurate bus information in this mode. The device can only report bus wake-up events via the RXDx toggling mechanism.

When both CAN interfaces are in Standby mode, the power consumption from V_{DD} and V_{IO} is extremely low. The CANHx and CANLx pins are pulled to GND via the internal R_{IN} resistors in this mode.

6.1.2.1 Wake-up Mechanism

The CM0902 includes bus monitoring circuitry to detect and report bus wake-ups. To activate a wake-up report, three events must occur on the CAN bus:

- event 1: a dominant level for a time longer than t_{WU_FLT1} followed by
- event 2: a recessive level (event 2) longer than t_{WU_FLT2} followed by
- event 3: a dominant level (event 3) longer than t_{WU_FLT2}.

The RXD pin reports the bus state (bus dominant => RXD low, bus recessive => RXD high). The delay between bus dominant and RXD low, and bus recessive and RXD high is longer than in Normal mode (refer to t_{TGLT}). The three events must occur within the t_{WU_TO} timeout.

Figure 5 “Wake-up Pattern Timing Illustration” illustrates the wake-up detection and reporting (toggling) mechanism.

If the three events do not occur within the T_{WU_TO} timeout, the wake-up and toggling mechanism are not activated. This is illustrated in Figure 6. The three events and the timeout function avoid a permanent dominant state on the bus which would generate a permanent wake-up situation, and prevent the system from entering into Low-power mode.

6.1.3 Unpowered Mode

When V_{IO} is below $V_{IO\ UV}$, the device is in unpowered mode. Both CAN buses is in high-impedance and not able to transmit, receive, or report bus wake-up events through any of the buses.

6.2 Fail-safe Mechanisms

The device implements various protection, detection, and predictable fail-safe mechanisms explained below.

6.2.1 STB and TXD Input Pins

The STBx input pin has an internal integrated pull-up structure to the VIO supply pin. If STBx is open, the respective CANx interface is set to Standby mode to ensure predictable behavior and minimize system current consumption.

The TXDx input pin also has an internal integrated pull-up structure to the VIO supply pin. If TXDx is open, the CANx driver is set to the recessive state to minimize current consumption and ensure no false dominant bit is transmitted on the bus.

6.2.2 TXD Dominant Timeout Detection

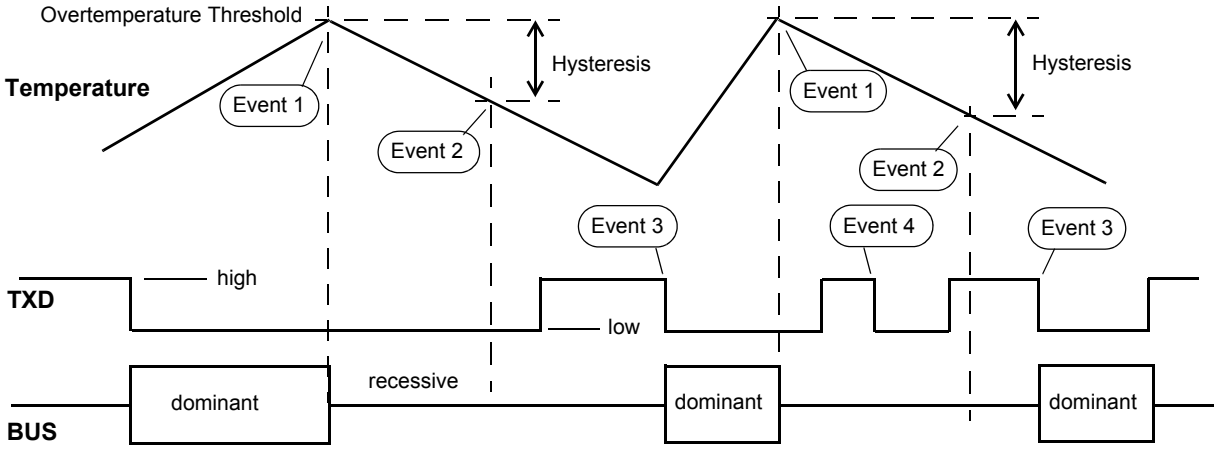
The 33CM0902 device implements a TXD dominant timeout detection and protection mechanism. If TXDx is set low for a time longer than the tX_{DOM} parameter, the CANx drivers are disabled and the CANx bus returns to the recessive state. This prevents the bus from being set to the dominant state permanently in case a fault sets the TXDx input to low level permanently. The device recovers when a high level is detected on TXDx (Refer to Figure 7).

6.2.3 CAN Current Limitation

The current flowing in and out of the CANHx and CANLx driver is limited to a maximum of 100 mA, in case of a short-circuit (parameter for I_{LIM1}).

6.2.4 CAN Overtemperature

If the driver temperature exceeds T_{SD}, the driver turns off to protect the device. A hysteresis is implemented in this protection feature. The device overtemperature and recovery conditions are shown in Figure 10. The driver remains disabled until the temperature has fallen below the OT threshold minus the hysteresis and a TXD high to low transition is detected. Since both CAN interfaces are fully independent, each driver requires a high to low transition of its own TXDx pin to re-enable the CAN driver.



Event 1: overtemperature detection. CAN driver disabled.
Event 2: temperature falls below “overtemperature. threshold minus hysteresis” => CAN driver remains disabled.
Event 3: temperature below “overtemperature. threshold minus hysteresis” and TxD high to low transition => CAN driver enabled.
Event 4: temperature above “overtemperature. threshold minus hysteresis” and TxD high to low transition => CAN driver remains disabled.

Figure 10. Overtemperature Behavior

6.2.5 V_{DD} and V_{IO} Supply Voltage Monitoring

The device monitors the V_{DD} and V_{IO} supply inputs.

The device is set in Standby mode if V_{DD} falls below $V_{DD\ UV}$ (VDD_UV). This ensures a predictable behavior due to the loss of V_{DD}. CAN drivers, receiver, or bus biasing cannot operate any longer. In this case, the bus wake-up is available as V_{IO} remains active.

If V_{IO} falls below $V_{IO\ UV}$ (VIO_UV), the device is set to an unpowered condition. This ensures a predictable behavior due to the loss of V_{IO}, CAN drivers, receivers, or bus biasing cannot operate any longer. This sets the bus in high-impedance and in ideal passive condition.

6.2.6 Bus Dominant State Behavior in Standby Mode

When the CAN interface is in Standby mode, a bus dominant condition due to a short-circuit or a fault in any of the CAN nodes, does not generate a permanent wake-up event, since the specific wake-up sequence and timeout protect the device from waking-up with an unwanted event.

6.3 Device Operation Summary

The following table summarizes the CAN interface operation and the state of the input/output pins, depending on the operating mode and power supply conditions.

STANDBY and NORMAL MODES

MODE	Description	V_{DD} Range	V_{IO} Range	STBx	TXDx	RXDx	CANx	Wake-up
Normal	Nominal supply and normal mode	from 4.5 V to 5.5 V	from 2.8 V to 5.5 V	Low	TXD High => bus recessive TXD Low => bus dominant	Report CAN state (bus recessive => RXD high, bus dominant => RXD low).	CANH and CANL drivers controlled by TXD input. Differential receiver reports the bus state on RXD pin. Biasing circuitry provides approx 2.5 V in recessive state.	Disabled
Standby	Nominal supply and standby mode	from 0.0 V to 5.5 V	from 2.8 V to 5.5 V	High or floating	No effect. on CAN bus.	Report bus wake up via toggling mechanism.	CAN driver and differential receiver disabled. Bus biased to GND via internal R_{IN} resistors.	Enabled

UNDERVOLTAGE and LOSS OF POWER CONDITIONS

Standby due to V_{DD} loss	Device in standby mode due to loss of V_{DD} (V_{DD} falls below $V_{DD\ UV}$)	from 0.0 to V_{DD_UV}. (10)	from 2.8 V to 5.5 V (11)	X (9)	X	Report bus wake up via toggling mechanism.	CAN driver and differential receiver disabled. Bus biased to GND via internal R_{IN} resistors.	Enabled
Unpowered due to V_{IO} loss	Device in unpowered state due to low V_{IO}. CAN bus high-impedance.	(10)	from 0.0 V to V_{IO_UV}	X	X	Pulled up to V_{IO} down to V_{IO} approx = 1.5 V, then released.	CAN driver and differential receiver disabled. High-impedance, with ideal passive behavior.	Not available.

Notes

9. STBx pin has no effect. CANx Interface enters in Standby mode.
10. V_{DD} consumption < 10 uA down to V_{DD} approx 1.5 V.
11. V_{IO} consumption < 10 uA down to V_{IO} approx 1.5 V. If STB is high or floating.

8 Packaging

8.1 Package Mechanical Dimensions

Package dimensions are provided in package drawings. To find the most current package outline drawing, go to www.freescale.com and perform a keyword search for the drawing's document number.

Table 8. Packaging Information

Package	Suffix	Package Outline Drawing Number

TITLE: 14LD SOIC N/B, 1.27 PITCH CASE-OUTLINE	DOCUMENT NO: 98ASB42565B	REV: J
	CASE NUMBER: 751A-04	04 DEC 2007
	STANDARD: JECDEC MS-012AB	

NOTES:

1. DIMENSIONS ARE IN MILLIMETERS.
2. DIMENSIONING AND TOLERANCING PER ASME Y14.5M–1994.
3. DATUMS A AND B TO BE DETERMINED AT THE PLANE WHERE THE BOTTOM OF THE LEADS EXIT THE PLASTIC BODY. DATUM T IS A SURFACE.
4. THIS DIMENSION DOES NOT INCLUDE MOLD FLASH, PROTRUSION OR GATE BURRS. MOLD FLASH, PROTRUSION OR GATE BURRS SHALL NOT EXCEED 0.15 MM PER SIDE. THIS DIMENSION IS DETERMINED AT THE PLANE WHERE THE BOTTOM OF THE LEADS EXIT THE PLASTIC BODY.
5. THIS DIMENSION DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.127 TOTOAL IN EXCESS OF THE LEAD WIDTH AT MAXIMUM MATERIAL CONDITION.

9 Revision History

Revision	Date	Description of Changes
1.0	6/2014	• Initial release
2.0	11/2014	• Data adjusted to match latest silicon
3.0	1/2015	• Changed ordering information from PC to MC
4.0	4/2015	• Added information for dual speed (up to 1 Mbit/s) • Added V_{REC_SM1} & V_{REC_SM2} (CANH, CANL recessive voltage, sleep mode) to Table 5 • Added driver symmetry V_{SYM1} & V_{SYM2} to Table 5 • Updated I_{IN_UPWR1} & I_{IN_UPWR2} in Table 5
