mikroBuffer PROTO ™

Additional board

All Mikroelektronika's development systems feature a large number of peripheral modules expanding microcontroller's range of application and making the process of program testing easier. In addition to these modules, it is also possible to use numerous additional modules linked to the development system through the I/O port connectors. Some of these additional modules can operate as stand-alone devices without being connected to the microcontroller.

mikroBuffer PROTO

The mikroBuffer PROTO additional board is used to amplify an analog voltage signal by using a unity gain amplifier. The amplified signal is then sent to the microcontroller analog inputs.

Key features:

- Analog signal unity gain;
- Low power consumption; and
- 3.3V or 5V power supply voltage.

Figure 1: mikroBuffer PROTO board

How to connect the board?

The mikroBuffer PROTO additional board can be easily connected to a microcontroller via a 1x6 connector CN1. Connectors CN2 and CN3 are used to establish connection between the board and a device that generates analog voltage signal to be amplified. The board is powered with 3.3V or 5V DC power supply voltage via the CN4 connector.
