1. Outline

The S1V3G340 is an LSI ideally suited to voice guidance products integrating high-compression, high-quality audio decoding functions, an external SPI flash memory interface, and a DA converter. Use of a Speech data creation tool dedicated to the S1V3034x enables the generation of high quality audio data from texts with ease without the bother of studio recording. Using external SPI flash memory makes it easy to switch voice data. When an additional sound is required, it can respond by transmitting voice data from a host. The S1V3G340 features general-purpose output ports for flexible system design. All the functions are controlled by commands over a serial interface and thus easily added onto any existing systems with a host processor. The S1V3G340 is pin compatible with the S1V3034x Series and S1V3S344, allowing interchangeability to suit system configurations.

The S1V3G340 enables faster Time-to-Market for products with voice guidance functions.

2. Features

2. Features

- Audio reproduction
 - High quality decoding (In EPSON's original format)
 - Bit rate: 40 kbps, 32 kbps, 24 kbps, 16 kbps
 - Sampling rate: 16 kHz
- Sequencer Messages
 - A sequence with up to 64 phrases can be set (no restriction on phrase combination)
 - Programmable delay time between phrases: 0 ms or 20 to 2047 ms (in 1-ms steps)
- External SPI flash memory interface
 - Clock-synchronized serial interface (SPI)
- GPO
 - x7
- Host Interface
 - Synchronous Serial Interface
 - Asynchronous serial interface (UART)
(Supported only when system clock is 32.768 kHz.)
 - I2C interface
 - Command Control
- 16-bit DA converter
 - Sampling rate(f_s): 16 kHz
 - Input bit: 16 bits
- System clock
 - Frequency (direct input): 32.768 kHz or 12.288 MHz
 - Frequency (oscillator): 32.768 kHz
- Package
 - 52-pin QFP (10 mm x 10 mm) with 0.65 mm pitch-pins
- Supply voltage
 - 2.2 to 5.5 V (I/O and Core Power Supply)

3. Pinout Diagram

4. Pin Description

4. Pin Description

- Symbols

I = Input pin

O = Output pin

IO = Bi-directional pin

P = Power Pin

Z = High Impedance

- I/O Cells

Symbol	Function
IC	LVC MOS Input
IH	LVC MOS Schmitt level Input
O1	Output Buffer (2 mA / -2 mA output current when 5.0 V(typ.))
O2	Output Buffer (4.0 mA / -0.4 mA output current when 5.0 V(typ.))
T1	3-state Output Buffer (2 mA / -2 mA output current when 5.0 V(typ.))
T2	3-state Output Buffer (4.0 mA / -4.0 mA output current when 5.0 V(typ.))
BC1	Bi-directional IO Buffer (2 mA / -2 mA output current when 5.0 V(typ.))
LLIN	Transparent Input (1.8 V)
LLOT	Transparent Output (1.8 V)
HLIN	Transparent Input (HVDD)
ITST1	Test input with pull-down resistor (120 kΩ when 1.8 V (typ))

Pin Name	Pin (52)	I/O	I/O Cell Type	State at NRESET=L	I/O Power	Function
Serial Interface						
SIS/RXD/SDA	47	IO	BC1	Z	HVDD	[Clock synchronous] Serial Data Input [Asynchronous] Serial Data Input [I2C] Data input/output
SCKS/SCL	48	I	IC	Z	HVDD	[Clock synchronous] Serial Clock Input [Asynchronous] H-level fixed [I2C] Serial Clock Input
SOS/TXD	45	O	T2	See section 5.3	HVDD	[Clock synchronous] Serial Data Output [Asynchronous] Serial Data Output [I2C] Open
NSCSS	49	I	IC	Z	HVDD	[Clock synchronous] Slave Device Select Input (L active) [Asynchronous] L fixed [I2C] L fixed
MSGRDY	43	O	O1	L	HVDD	Serial Output Data Ready (H active)
SHISEL0	39	I	IC	Z	HVDD	Serial interface selection SHISEL[1:0] = LL: Clock synchronous SHISEL[1:0] = *H: Asynchronous SHISEL[1:0] = HL: I2C

4. Pin Description

Standby mode control						
STBYEXIT	41	I	IC	Z	HVDD	STANDBY mode exit control Input (L: Exit STANDBY mode, H: Continue STANDBY mode)
Audio output						
HPOP	24	O	T2	Z	HVDD	Audio output
HPON	16	O	T2	Z	HVDD	Audio output (Can be set so that output stops when SNGLEND = H (L level).)
SPHMT	5	O	O1	See Function	HVDD	PWM output interval output (Active only while PWM waveform is output from output pin HPO. Inactive for NRESET = L. Active level polarity can be defined to suit input pin HMTPOL settings. L active for HMTPOL = L, H active for HMTPOL = H)
General-purpose GPO pins						
GP00	12	O	O1	L	HVDD	General-purpose output
GP01	17	O	O1	L	HVDD	General-purpose output
GP02	18	O	O1	L	HVDD	General-purpose output
GP03	19	O	O1	L	HVDD	General-purpose output
GP04	20	O	O1	L	HVDD	General-purpose output
GP05	21	O	O1	L	HVDD	General-purpose output
GP06	22	O	O1	L	HVDD	General-purpose output
External SPI flash memory interface						
SMCS	33	O	O1	L	HVDD	SPI flash memory chip select
SMSCK	50	O	O2	L	HVDD	SPI flash memory serial clock
SMSI	38	I	IC	Z	HVDD	SPI flash memory serial data in
SMSO	37	O	O1	L	HVDD	SPI flash memory serial data out
System clock						
CLKI	31	I	IC	Z	HVDD	Clock input (See section 5.2)
OSCI	36	I	LLIN	Z	-	Oscillator connector pin (See section 5.2)
OSCO	35	O	LLOT	-	-	Oscillator connector pin (See section 5.2)
CLKSEL	25	I	IC	Z	HVDD	System clock frequency selection (L: 32.768 kHz, H: 12.288 MHz) (See section 5.2)
OSCEN	27	I	IC	Z	HVDD	System clock source selection (L: CLKI input, H: oscillator (OSCI/OSCO)) (See section 5.2)
Hardware reset						
NRESET	8	I	IH	Z	HVDD	Hardware reset input (L active)
Mode setting						
SNGLEND	29	I	IC	Z	HVDD	Audio output mode selection (L: differential output, H: single end output)
HMTPOL	28	I	IC	Z	HVDD	SPHMT polarity selection (L active for L: SPHMT, H active for H: SPHMT)

4. Pin Description

Test input/output						
TESTEN	6	I	ITST1	Pull-down	-	Test pin (Connected to VSS during normal operations)
VCP	32	O	LLOT	-	-	Test pin (Open during normal operations)
TSTIN2	11	I	IC	Z	HVDD	Test pin (Connected to VSS during normal operations)
TSTIN0	9	I	IC	Z	HVDD	Test pin (Connected to VSS during normal operations)
FSOUT	15	O	T1	Z	HVDD	Test pin (Open during normal operations)
SPISWP	46	I	IC	Z	HVDD	Test pin (Connected to VSS during normal operations)
Internal voltage drop regulator						
CE	51	I	HLIN	Z	HVDD	Test pin (Connected to HVDD during normal operations)
VOUT	4	O	-	-	-	Internal voltage drop regulator output pin (1.8 V) (Connect 1 μ F capacitor between VOUT and RVSS.)

Pin name	Pin (52)	I/O	Function
Power supply			
HVDD	1, 14, 30, 44	P	IO cell power supply
VSS	13, 26, 34, 40, 52	P	Internal area and IO cell GND
RVDD	3	P	Internal voltage drop regulator power supply
RVSS	2	P	Internal voltage drop regulator GND
Unused pins			
NC	7, 23, 42,	NC	Unused pins

5. Function Description

5.1 Standard Application System

Figure 5.1 Standard application system

Figure 5.1 shows a standard S1V3G340 application system. The host controls the S1V3G340 with commands (message protocol) issued via the serial interface. After Power On Reset, the S1V3G340 outputs audio from the internal DA converter while performing internal processing including decoding of the audio data from the SPI flash memory and the compressed audio data transmitted from the host.

For more information on commands, see “S1V3034x Series Message Protocol Specification.”

For more information on voice guidance creation tools, see “EPSON Speech IC Voice Guidance Creation Tool User Guide.”

5. Function Description

5.2 System Clock

The S1V3G340 system clock frequency can be set to either 32.768 kHz or 12.288 MHz. The clock source can be set to be either direct input (input from CLKI pin) or oscillator (connected to OSCI/OSCO pin). Note that only 32.768 kHz oscillators can be used. The frequency and clock source settings are defined by the input pin CLKSEL and OSCEN settings. Table 5.1 shows system clock mode settings.

Table 5.1 System clock mode settings

Mode setting		Clock frequency	Clock pin settings		
CLKSEL	OSCEN		CLKI	OSCI	OSCO
0	0	32.768 kHz	32.768 kHz input	L level input	Open
0	1	32.768 kHz	L level input	Connect 32.768 kHz oscillator	
1	0	12.288 MHz	12.288 MHz input	L level input	Open
1	1	12.288 MHz	Must not be selected.		

5.3 Serial Interface

The S1V3G340 serial interface can be set to clock synchronous, asynchronous (UART), or I2C.

- Clock synchronous
Supports slave mode.
Data length: 8-bit, fixed, MSB first
- Asynchronous (UART)
Data length: 8-bit, fixed, LSB first
Start bit: 1-bit, fixed
Stop bit: 1-bit or 2-bit, selectable (default: 1-bit)
Parity bit: Even, odd, or none, selectable (default: none)
Baud rate [bps]: 460 k, 230 k, 115 k, 57.6 k, 38.4 k, 19.2 k, 9.6 k (default: 9.6 kbps)
- I2C
Supports I2C slave mode.
Maximum transfer speed: 83.3 kHz (when I2C bus rising time is 480 ns or less)

Serial interface selection is defined by the input pin SHISEL[1:0] settings.

Table 5.2 lists serial interface mode settings.

Table 5.2 Serial interface mode settings

SHISEL		Interface	Serial interface pin settings			
1	0		SCKS	SIS	SOS	NSCSS
0	0	Clock synchronous	Serial clock input	Data input	Data output	Slave selection input
0	1	UART	H-level input	Data input	Data output	L-level input
1	1					
1	0	I2C	Serial clock input	Data input/output	(Open)	L-level input

5. Function Description

Table 5.3 shows the pin states when hardware resetting is enabled (NRESET=L).

Table 5.3 States when hardware resetting is enabled (serial interface)

SHISEL		Interface	States for NRESET=L (L: L-level output, H: H-level output, Z; High-impedance)			
1	0		SCKS	SIS	SOS	NSCSS
0	0	Clock synchronous	Z	Z	Dependent on NSCSS input level L (when NSCSS = L) Z (when NSCSS = H)	Z
0	1	UART	Z	Z	H	Z
1	1					
1	0	I2C	Z	Z	Z	Z

Note:

- The asynchronous serial interface (UART) is not available when the selected system clock frequency is 12.288 MHz.
- The maximum transfer speed of the I2C interface is 83.3 kHz. This maximum transfer speed is based on the I2C bus rising time of 480 ns or less. It should be noted that the maximum transfer speed will be lower if the I2C bus rising time exceeds 480 ns due to the load capacity and pull-up resistance.
- When using the I2C interface, it is recommended to use the sequence playback.

6. Electrical Characteristics

6.1 Absolute Maximum Rating

(VSS = 0V)

Parameter	Symbol	Rate Value	Unit
Supply Voltage	HVDD	VSS-0.3 to 7.0	V
	RVDD	VSS-0.3 to 7.0	V
Input Voltage	HVI	VSS-0.3 to HVDD+0.5	V
Output Voltage	HVO	VSS-0.3 to HVDD+0.5	V
Output Current/Pin	IOUT	±10	mA
Storage Temperature	Tstg	-65 to +150	°C

6.2 Recommended Operating Conditions

(VSS = 0V)

Parameter	Symbol	Min.	Typ.	Max.	Unit
Supply Voltage	HVDD	2.2	-	5.5	V
	RVDD	2.2	-	5.5	V
Input Voltage	HVI	VSS	-	HVDD	V
Output Voltage	HVO	VSS	-	HVDD	V
Ambient Temperature	Ta	-40	25	85	°C

6. Electrical Characteristics

6.3 DC Characteristics

6.3.1 DC Characteristics for 5.0 V ± 0.5 V Supply Voltage

(HVDD / RVDD = 5.0 ± 0.5 V, VSS = 0 V, Ta = -40°C to 85°C)

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit

*2: Static current under the recommended operating conditions (Ta=25°C).

6. Electrical Characteristics

6.4 AC Characteristics

6.4.1 System Clock Timing (32.768 kHz)

Figure 6.1 System clock timing (32.768 kHz)

Symbol	Parameter	Min.	Typ.	Max.	Unit
f_{osc}	Input clock frequency	-	32.768	-	kHz
T_{osc}	Input clock period	-	$1/f_{osc}$	-	ms
t_{pwh}	Input clock pulse width high	$0.45 \cdot T_{osc}$	-	$0.55 \cdot T_{osc}$	ms
t_{pwl}	Input clock pulse width low	$0.45 \cdot T_{osc}$	-	$0.55 \cdot T_{osc}$	ms
t_r	Input clock rising time (10% → 90%)	-	-	5.0	μs
t_f	Input clock falling time (90% → 10%)	-	-	5.0	μs
t_{Cjper}	Input clock period jitter (*2, 4)	-5.0	-	5.0	ns
$t_{Cjcycle}$	Input clock cycle jitter (*1, 3, 4)	-5.0	-	5.0	ns
*1	$t_{Cjcycle} = t_{cycle1} - t_{cycle2}$				
*2	The input clock period jitter is the displacement relative to the center period (reciprocal of center frequency).				
*3	The input clock cycle jitter is difference in period between adjacent cycles.				
*4	The jitter characteristics must meet both t_{Cjper} and $t_{Cjcycle}$ characteristics.				
*	Great care must be taken to ensure that overshooting or undershooting does not occur for the clock.				

6.4.2 System Clock Timing (12.288 MHz)

Figure 6.2 System clock timing (12.288 MHz)

Symbol	Parameter	Min.	Typ.	Max.	Unit
f_{OSC}	Input clock frequency	-	12.288	-	MHz
T_{OSC}	Input clock period	-	$1/f_{osc}$	-	μs
t_{pwh}	Input clock pulse width high	$0.45 \cdot T_{osc}$	-	$0.55 \cdot T_{osc}$	μs
t_{pwl}	Input clock pulse width low	$0.45 \cdot T_{osc}$	-	$0.55 \cdot T_{osc}$	μs
t_r	Input clock rising time (10% $\rightarrow$ 90%)	-	-	5.0	ns
t_f	Input clock falling time (90% $\rightarrow$ 10%)	-	-	5.0	ns
t_{CJper}	Input clock period jitter (*2, 4)	-400	-	400	ps
$t_{CJcycle}$	Input clock cycle jitter (*1, 3, 4)	-400	-	400	ps
*1	$t_{CJcycle} = t_{cycle1} - t_{cycle2}$				
*2	The input clock period jitter is the displacement relative to the center period (reciprocal of center frequency).				
*3	The input clock cycle jitter is difference in period between adjacent cycles.				
*4	The jitter characteristics must meet both t_{CJper} and $t_{CJcycle}$ characteristics.				
*	Great care must be taken to ensure that overshooting or undershooting does not occur for the clock.				

6. Electrical Characteristics

6.4.3 Power-on / Reset Timing

Figure 6.3 Power on / reset timing

Symbol	Item		Min.	Max.	Unit
t ₁	Minimum delay from the HVDD power-on to the CLKI/OSCI rising edge before NRESET release.	Input clock source: CLKI	100	-	μs
		Input clock source: OSCI	10	-	ms
t ₂	The minimum NRESET assertion on system power up.		2	-	T _{OSC} (*1)
t ₃	NRESET synchronization time (Number of clock cycles before the reset signal is applied internally.)		2	-	T _{OSC} (*1)
*1	T _{OSC} is the CLKI / OSCI clock period.				

Note: The circuit must be initialized with NRESET after initiating power supply. The internal circuit state cannot be guaranteed when switching the HVDD from off to on, due to power supply noise and other factors.

6.4.4 Command Receipt Timing

Figure 6.4 Command receipt timing

The system starts up after t_1 time following hardware reset.

Then ISC_TEST_REQ/RESP message flow can be used.

Symbol	Parameter	Min.	Max.	Unit
t_1	Length of time from initialization to message acceptance ready state (*1)	120	-	ms
*1	There should be no problem about sending padding bytes during the t_1 period.			

6. Electrical Characteristics

6.4.5 Serial Interface (Clock Synchronous)

Figure 6.5 Clock synchronous serial interface timing

Symbol	Parameter	Min.	Max.	Unit
t_1	NSCSS falling time to SCKS falling time	100	-	ns
t_2	SCKS cycle time	1.0	-	μ s
t_3	SCKS rising time to NSCSS rising time	100	-	ns
t_5	SIS setup time	30	-	ns
t_6	SIS hold time	30	-	ns
t_7	SCKS falling time to SOS going active	-	50	ns
t_8	NSCSS falling time to SOS going active	-	50	ns
t_9	NSCSS rising time to SOS going Hi-Z	-	50	ns

6.4.6 Serial Interface (I2C)

Figure 6.6 I2C timing

Symbol	Parameter	Min.	Max.	Unit
t_c	SCL clock frequency (*1)	12.0	-	μs
t_{ch}	SCL clock pulse width high	6.0	-	μs
t_{cl}	SCL clock pulse width low (*1)	6.0	-	μs
t_{su}	SDA input setup time	0.5	-	μs
t_h	SDA input hold time	0	-	μs
t_d	SDA output delay time (*1)	-	5.5	μs
t_{ss}	START condition start time	2.5	-	μs
t_{se}	START condition completion time	2.5	-	μs
t_{ps}	STOP condition start time	2.5	-	μs
t_{pe}	STOP condition completion time	2.5	-	μs
*1	These numerical values are based on the I2C bus rising time of 480 ns or less. It should be noted that the numerical values will be greater if the I2C bus rising time exceeds 480 ns due to the load capacity and pull-up resistance.

6.4.7.2 Host flash access timing

Figure 6.8 Host flash access timing

Symbol	Item	Min.	Max.	Unit
t_1	Delay time from NSCSS input to SMCS output	-	50	ns
t_2	Delay time from NSCSS input to SMCS output	-	50	ns
t_3	Delay time from SCKS input to SMSCK output	-	50	ns
t_4	Delay time from SCKS input to SMSCK output	-	50	ns
t_5	Delay time from SIS input to SMSO output	-	50	ns
t_6	Delay time from SIS input to SMSO output	-	50	ns
t_7	Delay time from SMSI input to SOS output	-	50	ns
t_8	Delay time from SMSI input to SOS output	-	50	ns
In flash access mode, the serial communication interface signal is connected to the SPI flash memory interface. For details of flash access mode, refer to the "Flash Access Specifications."				

7. External Connection Examples

7.1 System Clock

The S1V3G340 system clock frequency can be set to either 32.768 kHz or 12.288 MHz. Likewise, the clock source can be set to either direct input (input from CLKI pin) or oscillator (connected to OSCI/OSCO pin). Note that only 32.768 kHz oscillators can be used. External connection examples are shown below for various clock supply configurations.

7.1.1 Direct Input

Figure 7.1 shows an example of an external connection in which the clock signal input to the CLKI pin is used as the clock source.

Figure 7.1 System clock external connection example (CLKI pin)

The CLKI pin receives 32.768 kHz or 12.288 MHz clock signal input generated by an oscillator.

The CLKSEL pin should be set to Low level for 32.768 kHz and to High level for 12.288 MHz.

The OSCEN pin should be set to Low level.

The OSCI pin should be set to Low level.

The OSCO pin should not be connected.

Note that the asynchronous serial interface (UART) is not available if the system clock frequency is set to 12.288 MHz.

7.1.2 Oscillator (32.768 kHz)

Figure 7.2 shows an example of an external connection in which a 32.768 kHz oscillator is used as the clock source.

Figure 7.2 Example of external system clock connection (32.768 kHz oscillator)

The 32.768 kHz oscillator and oscillator circuit is connected to the OSCI and OSCO pins as shown in Figure 7.2.

The CLKSEL pin should be set to Low level.

The OSCEN pin should be set to High level.

The CLKI pin should be set to Low level.

Table 7.1 gives typical external circuit constants for a 32.768 kHz oscillator. These will vary, depending on individual oscillator characteristics (e.g., components and circuit board patterns used). The values given in Table 7.1 are examples only and do not constitute performance guarantees.

Table 7.1 32.768 kHz oscillator external circuit constant examples

X'tal	32.768 kHz oscillator	Crystal (Epson Toyocom FC-135)
Cg	Gate capacity	10 pF
Cd	Drain capacity	10 pF
Rf	Feedback resistance	10 MΩ
Rd	Drain resistance	200 kΩ

7. External Connection Examples

7.2 Serial Interface

7.2.1 Clock Synchronous

Figure 7.3 Example of serial interface external connection (clock synchronous)

When using a clock synchronous serial interface, set both input pins SHISEL0 and SHISEL1 to Low level.

SOS is active when NSCSS is Low level. SOS will be high impedance when NSCSS is High level. Multiple slave devices can be connected through a general output port or host serial interface slave device selection signal as shown in Figure 7.3. When controlling the NSCSS pin via a host general port, set to Low level immediately before sending a message and to High level once a message is received.

MSGRDY is an output signal that indicates a command from the S1V3G340 is ready to be sent. This signal can be used as an interrupt signal sent to the host to warn the host to reduce loads to prepare for message receipt. For more information on MSGRDY output timing, see “S1V3034x Series Message Protocol Specification.”

STBYEXIT is an input signal to implement recovery from standby mode to normal operating mode. For more information on STBYEXIT input timing, see “S1V3034x Series Message Protocol Specification.”

7.2.2 Asynchronous (UART)

Figure 7.4 Serial interface external connection example (asynchronous)

When using an asynchronous serial interface (UART), the SHISEL0 input pin should be set to High level and SHISEL1 should be set to Low level. Note that the UART interface is not available when the system clock frequency is 12.288 MHz.

The initial interface settings are as shown below.

Start bit length: 1 bit

Stop bit length: 1 bit

Parity bit: None

Baud rate: 9.6 kbps

The interface settings can be changed using the ISC_UART_CONFIG_REQ message. Interface settings set via this message will be maintained until a hardware reset. A hardware reset restores interface settings to the initial default values shown above. The ISC_UART_CONFIG_REQ message can be used if necessary. For additional information, see “S1V3034x Series Message Protocol Specification.”

MSGRDY is an output signal indicating that a command to be sent from the S1V3G340 is ready to be sent. For more information on the data receiving flow on the host side and the MSGRDY output timing, see “S1V3034x Series Message Protocol Specification.”

STBYEXIT is an input signal used to implement recovery from standby mode to normal operating mode. For more information on the STBYEXIT input timing, see “S1V3034x Series Message Protocol Specification.”

7. External Connection Examples

7.2.3 I2C

Figure 7.5 Serial interface external connection example (I2C)

If I2C is used, set the SHISEL0 input pin to Low level and SHISEL1 to High level.

MSGRDY is an output signal indicating that a command to be sent from the S1V3G340 is ready to be sent. For more information on the data receiving flow on the host side and the MSGRDY output timing, see “S1V3034x Series Message Protocol Specification.”

STBYEXIT is an input signal used to implement recovery from standby mode to normal operating mode. For more information on the STBYEXIT input timing, see “S1V3034x Series Message Protocol Specification.”

8. Package Dimensions

8.1 QFP13-52

Symbol	Dimension in Millimeters		
	Min	Non	Max

9. Reference Material

9.1 Circuit Application Example

Figure 9.1 shows a typical S1V3G340 circuit application.

Figure 9.1 S1V3G340 circuit application example

*1: The system clock input unit connection configuration will vary, depending on the clock frequency and clock source used. Refer to section 7.1 for more information.

*2: The serial interface connection configuration will vary, depending on the interface type used. Refer to section 7.2 for additional information.

9.2 Circuit Application Example (Audio Output Unit)

Figure 9.2 shows a typical audio output unit circuit application.

Figure 9.2 S1V3G340 circuit application example (audio output unit)

The connection from the HPOP/HPON pins to the secondary LPF (510 Ω, 39 nF) should be as short as possible. The secondary LPF capacitor (39 nF) GND connection to the VSS should also be as short as possible.

The speaker amplifier peripheral circuit and circuit constants shown in Figure 9.2 are provided solely for reference and do not constitute performance guarantees.

9. Reference Material

9.3 Mute Start/Release Timing

It is recommended to control the mute function of the speaker amplifier by using the general-purpose input/output port in order to minimize noise at power ON/OFF and in standby. The following shows an example of mute control timing in each operation condition.

9.3.1 System Reset Active ⇒ Release

Symbol	Item	Min.	Max.	Unit
t_1	NRESET release time to MUTE release time	150	-	ms

Note: In the above timing chart, the MUTE pin is at the Low level and MUTE is active.

9.3.2 Standby Mode

The following shows an example of the MUTE control flow before and after standby mode.

- Transition to standby mode
MUTE enabled → STANDBY_ENTRY_REQ issued → STBYEXIT: High
- End of standby mode
STBYEXIT: Low → STANDBY_EXIT_IND received → MUTE released

Note: In the above timing chart, the MUTE pin is at the Low level and MUTE is active.

* Refer to the Message Protocol Specification for details of standby mode.

9.4 Power Supply Precautions

Always initialize the circuit with NRESET after initiating power supply. The internal circuit state cannot be guaranteed when switching the HVDD from off to on due to power supply noise and other factors.

CMOS devices may suffer from what is known as “latch-up.” This is a phenomenon in which the PNP bonds (thyristor configuration) inside the CMOS IC conduct, resulting in large currents between VDD and VSS and ultimately damaging the CMOS.

Latch-up occurs when the voltage applied to the input/output pins exceeds rated values, resulting in large currents within the component, or when the VDD pin voltage exceeds the ratings, causing internal components to yield. If the voltage exceeds the ratings even momentarily in these cases, a large current will arise between VDD and VSS once latch-up occurs, resulting in potential overheating and smoke generation. Always observe the following precautions:

- (1) Never raise the input/output pin voltage level above the supply voltage or above the range specified for electrical characteristics. Avoid lowering below VSS.
- (2) Make sure the device is not subject to abnormal noise.
- (3) The potential for unused input pins should be pegged to VDD or VSS.
- (4) Do not short-circuit the output.

9.5 Clock direct input precautions

Noise will be input to the power supply if the overshoot or undershoot in the clock is excessive when using an external direct clock input. This may cause the internal regulator output to fluctuate, possibly resulting in internal circuit damage or malfunction.

Clock overshoot and undershoot must be kept within the input voltage range indicated in Section “6.1 Absolute maximum rating.” If overshoot or undershoot is present, this should be addressed using a damping resistance or low pass filter.

The same prevention measures are required for external signals other than the clock external input, but particular caution is necessary for the clock due to the high frequency.

Figure 9.3 Typical clock input overshoot/undershoot prevention measures

9.6 Precautions on Mounting

The following shows the precautions when designing the board and mounting the IC.

9.6.1 Oscillation Circuit

Oscillation characteristics change depending on conditions such as components used (oscillator, R_f , R_d , C_g , C_d) and board pattern. In particular, when a ceramic or crystal oscillator is used, evaluate the components adequately under real operating conditions by mounting them on the board before the external resistor (R_f , R_d) and capacitor (C_g , C_d) values are finally decided.

Disturbances of the oscillation clock due to noise may cause a malfunction. To prevent this, the following points should be taken into consideration.

- Components that are connected to the OSCI and OSCO pins, such as oscillator, resistors and capacitors, should be connected in the shortest line.
- Whenever possible, configure digital signal lines with at least three millimeters clearance from the OSCI and OSCO and the components and lines connected to these pins. In particular, signals that are switched frequently must not be placed near these pins, components, and lines. The same applies to all layers on the multi-layered board as the distance between the layers is around 0.1 to 0.2 mm. Furthermore, do not configure digital signal lines in parallel with these components and lines when arranging them on the same or another layer of the board. Such an arrangement is strictly prohibited, even with clearance of three millimeters or more. Also, avoid arranging digital signal lines across these components and signal lines.
- Shield the OSCI and OSCO pins and lines connected to those pins as well as the adjacent layers of the board using VSS. As shown in Figure 9.4, shield the wired layers as much as possible. Whenever possible, make the whole adjacent layers the ground layers, or ensure there is adequate shielding to a radius of five millimeters around the above pins and lines. Do not configure digital signal lines in parallel with components and lines even if such components and lines on other layers.

Figure 9.4 Example of oscillation circuit VSS pattern

9.6.2 Reset Circuit

The power-on reset signal which is input to the NRESET pin changes depending on conditions (power rise time, component used, board pattern, etc.). Decide the constant of the capacitor and resistor after enough tests have been completed with the application product. With regard to the pull-up resistance of the NRESET pin, if the impedance is high, noise can generate a malfunction; therefore, the constants must be determined in careful consideration of resistance value variations.

9.6.3 Power Supply Circuit

Sudden power supply variation due to noise may cause malfunction. Consider the following points to prevent this:

- The power supply should be connected to the HVDD/RVDD and VSS/RVSS pins with pattern as short and large as possible.
- When connecting between the HVDD/RVDD – VSS/RVSS pins with a bypass capacitor, the HVDD/RVDD and VSS/RVSS pins should be connected as short as possible. The bypass capacitor will vary depending on the system, but should be several μF to several tens of μF .
- Connect a 1 μF bypass capacitor between VOUT and RVSS, and connect the VOUT and RVSS pins as short as possible.

Figure 9.5 Bypass capacitor connection example

9.6.4 Arrangement of Signal Lines

In order to prevent generation of electromagnetic induction noise caused by mutual inductance, do not arrange a large current signal line near the circuits that are sensitive to noise such as the oscillation unit.

When a signal line is parallel with a high-speed line in long distance or intersects a high-speed line, noise may be generated by mutual interference between the signals and it may cause a malfunction. Do not arrange a high-speed signal line especially near circuits that are sensitive to noise such as the oscillation unit.

9.6.5 Noise-Induced Erratic Operations

If erratic IC operations appear to be attributable to noise, consider the following three points.

- **NRESET pin**
Low-level noise on this pin resets the IC. However, the IC may not always be reset normally, depending on the input waveform. Due to circuit design, this situation tends to occur when the reset input is in the high state, with high impedance.
- **SCKS pin**
The SCKS pin is a synchronous clock input of a clock synchronous serial interface. If a noise goes into this pin, depending on the input waveform, it will be recognized as valid data, and will become the cause of malfunction. When connecting between the host and serial interface (SCKS, SIS, SOS and NSCSS) pins, these should be connected as short as possible.
- **Power supplies**
If noise lower than the rated voltage enters one of these power-supply lines, the IC may operate erratically. Take collective measures in board design; for example, by using solid patterns for power supply lines, adding decoupling capacitors to eliminate noise, or incorporating surge/noise counteracting devices into the power supply lines.

9.6.6 Others

Although the basic reliability of the S1V3G340 is designed to comply with EIAJ and MIL standards, please pay careful attention to the following points when actually mounting the chip on a board.

Since OSCI and OSCO pins are constructed to use the internal transistors directly, the pins are susceptible to mechanical damage during the board-mounting process. Moreover, the pins may also be susceptible to electrical damage caused by such disturbances (listed below) whose electrical strength are varying gradually with time and can exceed the absolute maximum rated voltage (2.5 V) of the IC.

- Electromagnetic induction noise from the utility power supply in the reflow process during board-mounting, rework process after board-mounting, or individual characteristics evaluation (experimental confirmation), and
- Electromagnetic induction noise from the tip of a soldering iron

Especially when using a soldering iron, make sure that the IC GND and soldering iron GND are at the same potential before soldering.
