

9-Line SCSI Bus Terminators

DESCRIPTION

The SiP5670 provides active bus termination suitable for all SCSI bus operational modes from SCSI-1 through SPI-4 (Ultra 320). The termination includes impedance matching of the SCSI bus to minimize signal reflections from the end of the bus, as well as required SCSI bus biasing for either S/E (Single Ended) or LVD (low voltage differential) operation.

The SiP5670 has nine (9) output channels (T1-T9). Each output channel provides termination for one SCSI data signal, parity signal or control signal. Two SiP5670 ICs provide complete termination for a narrow SCSI bus; three ICs provide complete termination for a wide SCSI bus.

An integrated mode change delay filter in the SiP5670 eliminates the need for a bulky 4.7 μ F low pass filter capacitor to be compliant with SPI-3 mode change timing requirements.

The SiP5670 senses the operational state of the SCSI bus via the DIFFSENS bus signal, and automatically switches to S/E or LVD operation as required. It cannot be used on an HPD (high power differential) SCSI bus, and goes into high impedance mode when the voltage on the DIFFSENS line indicates HPD operation. The SiP5670 also presents high impedance to the SCSI bus if the DISABLE pin is asserted, or if TERMPWR is removed from the IC.

The SiP5670 is available in a lead (Pb)-free QSOP-36 package for operation over the temperature range of 0 °C to 70 °C.

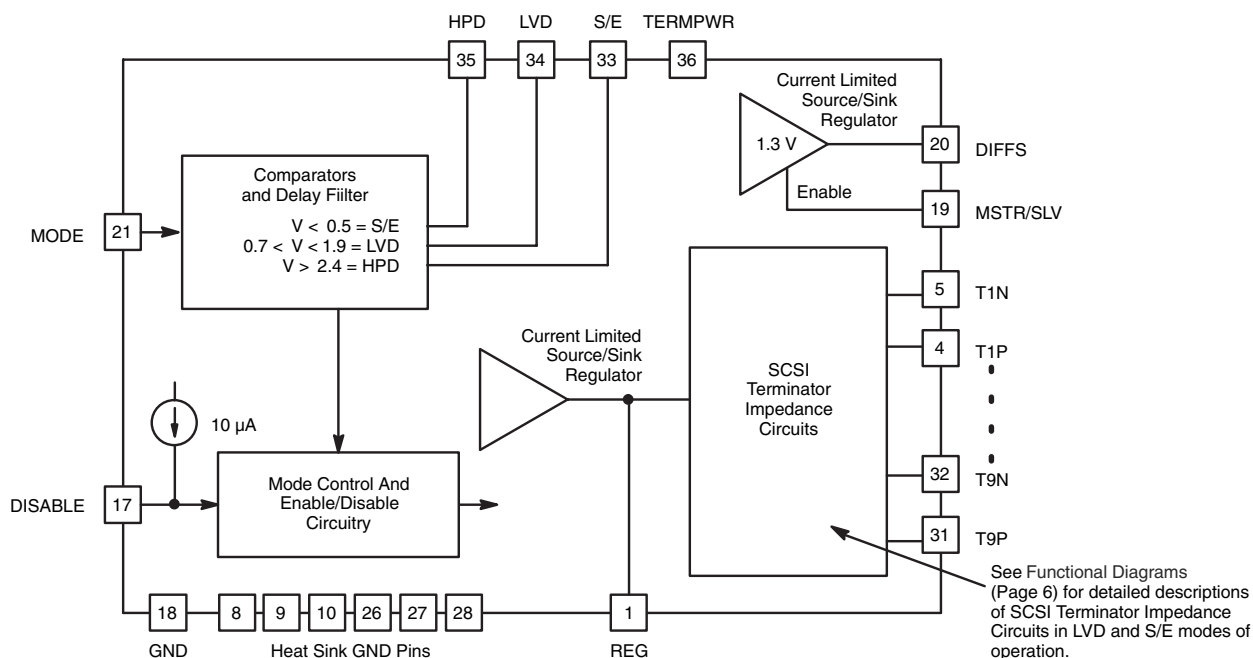

FEATURES

- Auto selection of S/E or LVD SCSI termination
- 2.7 V to 5.25 V TERMPWR range
- Meets SCSI-1, SCSI-2, SPI-2 (ULTRA-2), SPI-3 (ULTRA-160) and SPI-4 (ULTRA-320) standards
- Integrated SPI-3 mode change delay filter
- Differential failsafe bias
- Thermal package
- On-chip thermal shutdown circuit
- Master/slave input
- Active negation
- Hot swap compatible
- Pin compatible with UCC5670 and UCC5630
- QSOP-36 package

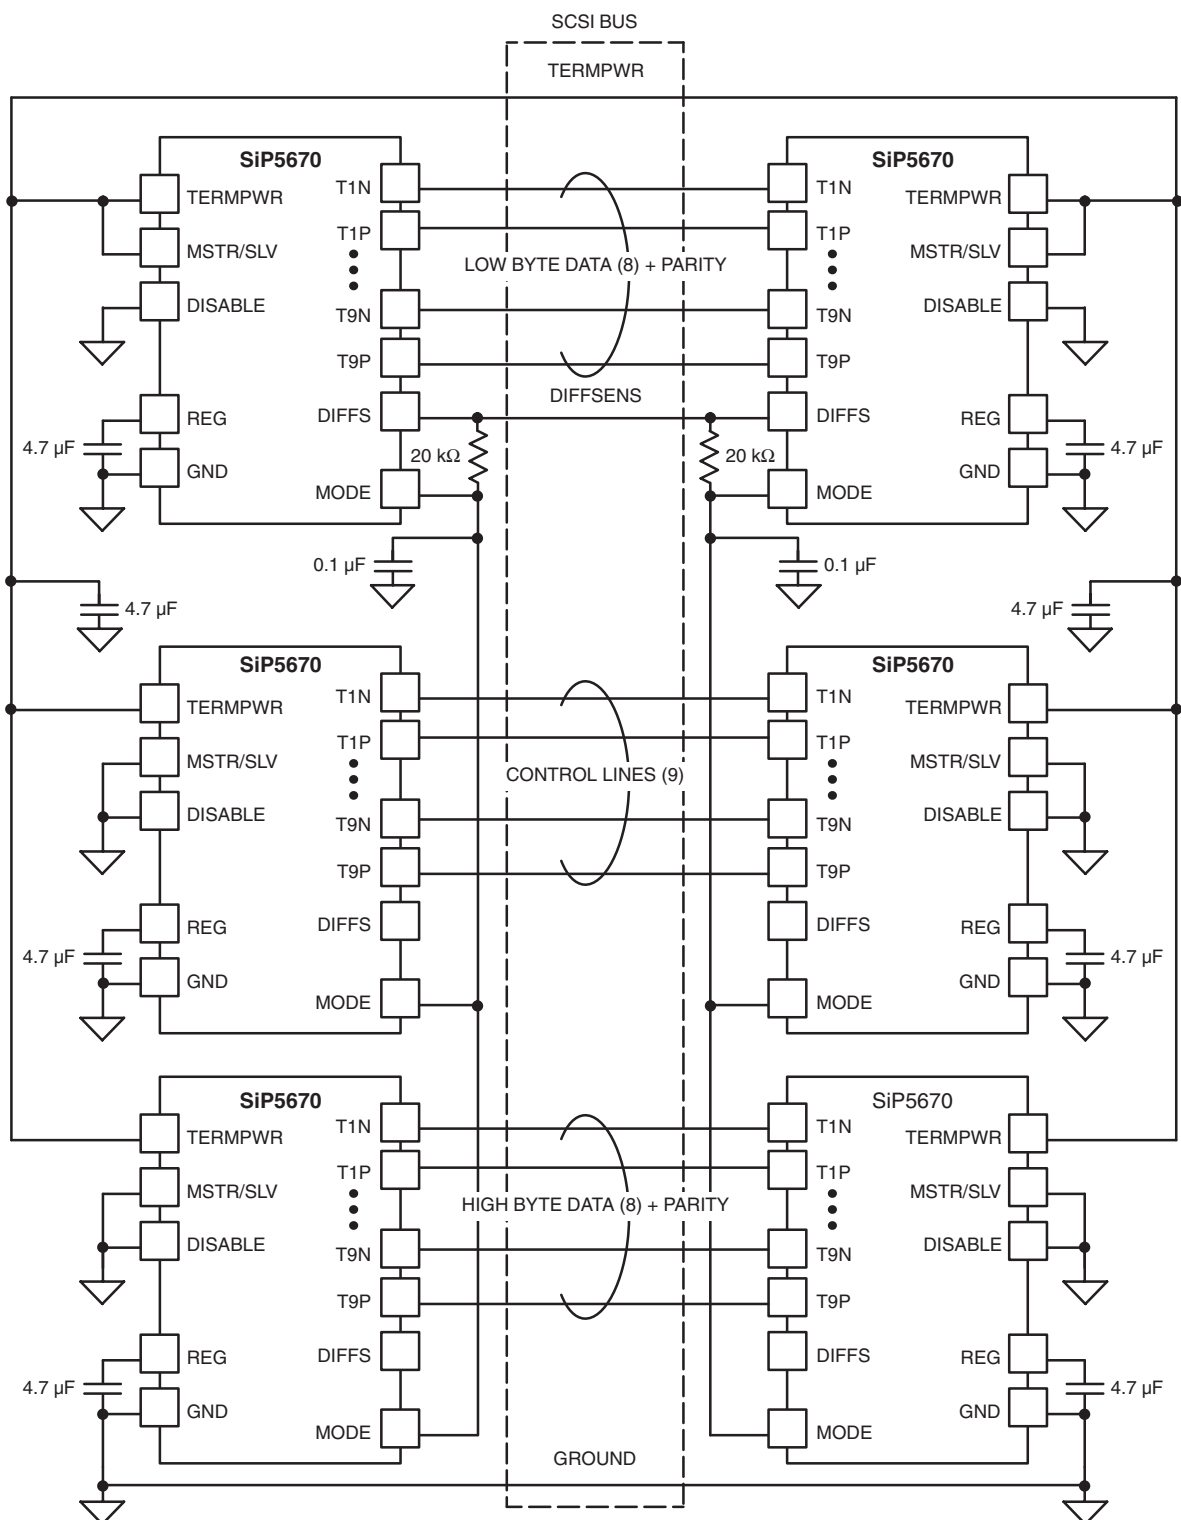

APPLICATIONS

- Disk array (RAID)
- Storage area networks (SAN)
- Network attached storage (NAS)
- SCSI cable
- Server and workstation
- Industrial computers
- High-end personal computers

FUNCTIONAL BLOCK DIAGRAM

TYPICAL APPLICATION DIAGRAM

ABSOLUTE MAXIMUM RATINGS (all voltages referenced to GND = 0 V)

Parameter	Limit	Unit
TERMPWR	6	V
TXN, TXP	- 0.3 to 6	
MODE, DISABLE, M/S, STATUS	- 0.3 to 6	
Storage Temperature	- 65 to 125	°C
Junction Temperature	150	

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING RANGE (all voltages referenced to GND = 0 V)

Parameter	Limit	Unit
TERMPWR	2.7 to 5.25	V
Operating Temperature Range (T _A)	0 to 70	°C

Notes:

- The algebraic convention whereby the most negative value is a minimum and the most positive a maximum is used in this datasheet.
- Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.
- MODE = 3 V and/or DISABLE = 3 V and/or TERMPWR = 0 V.
- Guaranteed by design, not subject to production test.
- V_{CM} applied simultaneously to line PLUS and Line MINUS pins of all SCSI channels T1-T9.
- V_{CM} applied simultaneously to line MINUS pins of all SCSI channels T1-T9.

PIN CONFIGURATION AND ORDERING INFORMATION

SiP5670 (QSOP-36)

ORDERING INFORMATION

Part Number	Temperature Range	Marking
SiP5670CG-T1-E3	0 °C to 70 °C	SiP5670CG

PIN DESCRIPTION

Pin Number	Name	Function
1	REG	SCSI regulator output. Connect a 4.7 μ F bypass capacitor from this pin to GND.
2, 3	N/C	No connect.
4, 6, 11, 13, 15, 22, 24, 29, 31	TXP; X = 1...9	Positive terminator channel pins. Provide positive signal line termination in LVD operation, and are connected to GND through low impedance in S/E operation. In HPD, DISABLE, or power off condition these pins present high impedance to the SCSI Bus.
5, 7, 12, 14, 16, 23, 25, 30, 32	TXN; X = 1...9	Negative terminator channel pins. Provide negative signal line termination in LVD operation, and line termination for S/E operation. In HPD, DISABLE, or power off condition these pins present high impedance to the SCSI Bus.
8, 9, 10, 26, 27, 28	H/S GND	Heat sink ground. Should be connected to as large a grounded heat sink area on the PC board as is practical.
17	DISABLE	Chip disable. There is a small (nominal 10 μ A) pull up current on this pin. Pull this pin to GND to enable bus termination. When this pin is left floating or pulled high all SCSI channel pins present high impedance to the SCSI bus, and the SCSI regulator and DIFFSENS regulator are both disabled.
18	GND	Electrical ground connection for the terminator IC. Connect to the ground lines of the SCSI bus
19	MSTR/SLV	Master/slave. If this pin is tied to TERMPWR the output of the 1.3 V regulator for DIFFSENS is enabled. If this pin is tied to GND the output of the 1.3 V regulator for DIFFSENS is inhibited.
20	DIFFS	DIFFSENS regulator output. Connect to the DIFFSENS line of the SCSI bus to bias the mode selection function.
21	MODE	SCSI MODE select pin. Connect to the DIFFSENS line of the SCSI bus to sense the present mode of operation on the bus. An internal time delay filter is provided, but it is recommended to decouple MODE from the DIFFSENS signal with a 20 k Ω /0.1 μ F anti-aliasing filter for reliable operation in noisy environments.
33, 34, 35	S/E, LVD, HPD	Status output pins. Respective pins are high when the terminator detects the corresponding mode of operation on the SCSI Bus, and low otherwise.
36	TERMPWR	Power for the terminator IC. Connect to the TERMPWR lines on the SCSI bus and decouple with a 4.7 μ F capacitor to GND at the IC.

DETAILED DESCRIPTION

The SiP5670 is a multimode active terminator IC, which detects the operating mode of the SCSI bus, and switches to the appropriate termination configuration accordingly.

Three SiP5670 terminators are required at each end of a wide SCSI bus to terminate 27 lines (18 data, 9 control). In LVD mode the SiP5670 provides 105 Ω differential impedance and 112 mV differential bias between each T-/T+ pair of terminator lines. In S/E mode the SiP5670 provides 108 Ω impedance and 2.7 V pull-up on each T- pin, and low impedance to ground on each T+ pin. In HPD mode the SiP5670 disconnects from the bus and presents high impedance to all T-/T+ lines.

Each SiP5670 IC has a 1.3 V DIFFSENS Regulator output that can be used to drive the DIFFSENS line of a SCSI bus. Since only one DIFFSENS regulator is required at each end of the SCSI bus each SiP5670 includes a MASTER/SLAVE pin to enable or disable its DIFFSENS regulator. The DIFFSENS regulator attempts to drive the DIFFSENS control signal to 1.3 V, but is current limited so that S/E or HPD devices on the SCSI bus can override the DIFFSENS regulator and put the bus into S/E or HPD mode of operation.

The MODE pin senses the operational state of the SCSI bus by detecting the voltage on the DIFFSENS control line. There is an integrated 200 mS glitch filter on the MODE input for reliable operation in noisy environments.

On power up, the SiP5670 initially defaults to a high impedance state on the termination pins. If the MODE pin detects S/E or LVD level on the DIFFSENS signal of the

SCSI bus the SiP5670 will wait a standard delay (200 ms typical) before changing its operating mode. During regular operation if the MODE pin detects another bus mode change the SiP5670 again waits a standard delay before changing its operating mode. This Mode Change Delay is implemented in accordance with SCSI standards SPI-3 and higher.

Three status lines (S/E, LVD, and HPD) are provided by the SiP5670. One and only one status line is asserted high when its corresponding mode has been detected; the other two status lines are driven low. The mode detection function continues to work even when the SiP5670 is in disconnect mode.

The DISABLE pin is used to connect/disconnect the SiP5670. If it is pulled to GROUND the SiP5670 is in connect mode, and operates as a terminator. If it is pulled to TERMPWR or left open the device is in disconnect mode and presents high impedance to the SCSI bus. In disconnect mode the DIFFSENS regulator is disabled but the mode detection circuitry continues to function and the status lines continue to indicate which mode is detected.

The SiP5670 operates within SCSI specifications with the TERMPWR voltage between 2.7 V and 5.25 V, which enables it to operate in both 5 V and 3.3 V systems. The 2.7 V lower limit guarantees correct performance in a 3.3 V system.
