#### 1. Introduction

#### 1.1. About This Document

This design guide provides information for designing a custom system Carrier Board for COM Express Type 6 Module. It includes Signal Descriptions, Routing Guidelines and Trace Length Guidelines. The main purpose is designing Carrier Board for helping customers fast and easy using the module of Advantech to be designed.

### 1.2. Signal Table Terminology

Table 1 below describes the terminology used in this section for the Signal Description tables.

The "#" symbol at the end of the signal name indicates that the active or asserted state occurs when the signal is at a low voltage level. When "#" is not present, the signal is asserted when at a high voltage level.

The terms "Input" and "Output" and their abbreviations in Table 1 below refer to the Module's view, i.e. an input is an input for the Module and not for the Carrier-Board.

Table 1: Signal Table Terminology Descriptions

Term	Description		
I/O 3.3V	Bi-directional signal 3.3V tolerant		
I/O 5V	Bi-directional signal 5V tolerant		
13.3V	Input 3.3V tolerant		
I 5V	Input 5V tolerant		
I/O 3V3_SBY	Bi-directional 3.3V tolerant active during Suspend and running state.		
O 3.3V	Output 3.3V signal level		
O 5V	Output 5V signal level		
OD	Open drain output		
Р	Power input/output		
*_S0	Signal active during running state.		
PCIE	In compliance with PCI Express Base Specification		
USB	In compliance with the Universal Serial Bus Specification		
GbE	In compliance with IEEE 802.3ab 1000BASE-T Gigabit Ethernet		
SATA	In compliance with Serial ATA specification		
REF	Reference voltage output. May be sourced from a Module power plane.		
PDS	Pull-down strap. A Module output pin that is either tied to GND or is not		
	connected. Used to signal Module capabilities (pin-out type) to the Carrier Board.		

# 1.3. Terminology

Table 2: Conventions and Terminology

Terminology	Description			
AC '97 / HDA	Audio CODEC '97/High Definition Audio			
ACPI	Advanced Configuration Power Interface – standard to implement power			
	saving modes in PCAT systems			
ADD2	Advanced Digital Display, 2nd Generation			
ADD2/MEC	Advanced Digital Display, 2nd Generation, Media Expansion Card			
Basic Module	COM Express® 125mm x 95mm Module form factor.			
BIOS	Basic Input Output System - firmware in PC-AT system that is used to			
	initialize system components before handing control over to the operating			
	system.			
CAN	Controller-area network (CAN or CAN-bus) is a vehicle bus standard			
	designed to allow microcontrollers to communicate with each other within a			
	vehicle without a host computer.			
Carrier Board	An application specific circuit board that accepts a COM Express® Module.			
Compact Module	COM Express® 95mm x 95mm Module form factor			
CRT	Cathode Ray Tube			
DAC	Digital Analog Converter			
DDC	Display Data Control - VESA (Video Electronics Standards Association)			
	standard to allow identification of the capabilities of a VGA monitor			
DDI	Digital Display Interface- containing DisplayPort, HDMI/DVI and SDVO			
DNI	Do Not Install			
DP	DisplayPort is a digital display interface standard put forth by the Video			
	Electronics Standards Association (VESA). It defines a new license free,			
	royalty free, digital audio/video interconnect, intended to be used primarily			
	between a computer and its display monitor.			
DP	DisplayPort is a digital display interface standard put forth by the Video			
	Electronics Standards Association (VESA). It defines a new license free,			
	royalty free, digital audio/video interconnect, intended to be used primarily			
	between a computer and its display monitor.			
DVI	Digital Visual Interface - a Digital Display Working Group (DDWG) standard			
	that defines a standard video interface supporting both digital and analog			
	video signals. The digital signals use TMDS.			

Terminology	Description		
EAPI	Embedded Application Programming Interface		
	Software interface for COM Express® specific industrial functions		
	System information		
	Watchdog timer		
	• I2C Bus		
	Flat Panel brightness control		
	User storage area		
	• GPIO		
EDID	Extended Display Identification Data		
EDP	Embedded DisplayPort (eDP) is a digital display interface standard		
	produced by the Video Electronics Standards Association (VESA) for digital		
	interconnect of Audio and Video.		
EEPROM	Electrically Erasable Programmable Read-Only Memory		
EFT	Electrical Fast Transient		
EMI	Electromagnetic Interference		
ESD	Electrostatic Discharge		
Express Card	A PCMCIA standard built on the latest USB 2.0 and PCI Express buses.		
Extended Module	COM Express® 155mm x 110mm Module form factor.		
FR4	A type of fiber-glass laminate commonly used for printed circuit boards.		
Gb	Gigabit		
GbE	Gigabit Ethernet		
GPI	General Purpose Input		
GPIO	General Purpose Input Output		
GPO	General Purpose Output		
HDA	Intel High Definition Audio (HD Audio) refers to the specification released by		
	Intel in 2004 for delivering high definition audio that is capable of playing		
	back more channels at higher quality than AC97.		
HDMI	High Definition Multimedia Interface		
I2C	Inter Integrated Circuit – 2 wire (clock and data) signaling scheme allowing		
	communication between integrated circuits, primarily used to read and load		
	register values.		
DE	Integrated Device Electronics – parallel interface for hard disk drives –		
	also known as PATA		
Legacy Device	Relics from the PC-AT computer that are not in use in contemporary PC		
	systems: primarily the ISA bus, UART-based serial ports, parallel printer		
	ports, PS-2 keyboards, and mice.		
	Definitions vary as to what constitutes a legacy device. Some definitions		

	include IDE as a legacy device.		
Terminology	Description		
LAN	Local Area Network		
LPC	Low Pin-Count Interface: a low speed interface used for peripheral circuits		
	such as Super I/O controllers, which typically combine legacy-device		
	support into a single IC.		
LS	Least Significant		
LVDS	Low-Voltage Differential Signaling – widely used as a physical interface for		
	TFT flat panels.		
	LVDS can be used for many high-speed signaling applications. In this		
	document, it refers only to TFT flat-panel applications.		
MEC	Media Expansion Card		
Mini Module	COM Express® 84x55mm Module form factor		
MS	Most Significant		
NA	Not available		
NC	Not connected		
OBD-II	On-Board Diagnostics 2nd generation		
OEM	Original Equipment Manufacturer		
PATA	Parallel AT Attachment – parallel interface standard for hard-disk drives –		
	also known as IDE,AT Attachment, and as ATA		
PC-AT	"Personal Computer - Advanced Technology" - an IBM trademark term		
	used to refer to Intel x86 based personal computers in the 1990s		
PCB	Printed Circuit Board		
PCI	Peripheral Component Interface		
PCI Express (PCIe)	Peripheral Component Interface Express - next-generation high speed		
	Serialized I/O bus		
PCI Express Lane	One PCI Express Lane is a set of 4 signals that contains two differential		
	lines for Transmitter and two differential lines for Receiver. Clocking		
	information is embedded into the data stream.		
PD	Pull Down		
PEG	PCI Express Graphics		
PHY	Ethernet controller physical layer device		
Pin-out Type	A reference to one of seven COM Express® definitions for the signals that		
	appear on the COM Express® Module connector pins.		
PS2	"Personal System 2" - an IBM trademark term used to refer to Intel x86		
PS2 Keyboard	based personal computers in the 1990s. The term survives as a reference to		
PS2 Mouse	the style of mouse and keyboard interface that were introduced with the PS2		
	system.		

Terminology	Description		
PU	Pull Up		
ROM	Read Only Memory - a legacy term - often the device referred to as a		
	ROM can actually be written to, in a special mode. Such writable ROMs are		
	sometimes called Flash ROMs. BIOS is stored in ROM or Flash ROM.		
RTC	Real Time Clock – battery backed circuit in PC-AT systems that keeps		
	system time and date as well as certain system setup parameters		
S0, S1, S2, S3, S4, S5	Sleep States defined by the ACPI specificationS0 Full power, all devices		
	powered		
	S1 Sleep State, all context maintained		
	S2 Sleep State, CPU and Cache context lost		
	S3 Suspend to RAM System context stored in RAM; RAM is in standby		
	S4 Suspend to Disk System context stored on disk		
	S5 Soft Off Main power rail off, only standby power rail present		
SATA	Serial AT Attachment: serial-interface standard for hard disks		
SDVO	Serialized Digital Video Out is a proprietary technology introduced by Intel®		
	to add additional video signaling interfaces to a system. Being phased out		
SMBus	System Management Bus		
SO-DIMM	Small Outline Dual In-line Memory Module		
SPI	Serial Peripheral Interface		
TBD	To be determined		
TMDS	Transition Minimized Differential Signaling - a digital signaling protocol		
	between the graphics subsystem and display. TMDS is used for the DVI		
	digital signals. DC coupled		
TPM	Trusted Platform Module, chip to enhance the security features of a		
	computer system.		
UIM	User Identity Module		
USB	Universal Serial Bus		
VESA	Video Electronics Standards Association		
WDT	Watch Dog Timer

### 2.3. PCI Express

#### 2.3.1. COM Express A-B Connector and C-D Connector PCle Groups

COM Express Type 6 Modules have two groups of PCIe lanes. There is a group of up to eight lanes; six are located on COM Express A-B connector and two on C-D connector that are intended for general purpose use, such as interfacing the COM Express Module to Carrier Board PCIe peripherals. A second group of PCIe lanes is defined on the COM Express C-D connector.

This group is intended primarily for the PCIe Graphics interfaces (also referred to as the PEG interface), and is typically 16 PCIe lanes wide. For some Modules, the PEG lanes may be used for general purpose PCIe lanes if the external graphics interface is not in use. This usage is Module and Module chipset dependent.

#### 2.3.2. General Purpose PCle Signal Definitions

The general purpose PCI Express interface of the COM Express Type 6 Module on the COM Express A-B connector consists of up to 6 lanes plus 2 lanes on connector C-D, each with a receive and transmit differential signal pair designated from PCIE\_RX0 (+ and -) to PCIE\_RX7 (+ and -) and correspondingly from PCIE\_TX0 (+ and -) to PCIE\_TX7 (+ and -). The 8 lanes may be grouped into various link widths as defined in the COM Express spec.

Table 4: General Purpose PCI Express Signal Descriptions

		Express Card - Connect to WAKE# pin 11 of		
		Express Card socket.		
		N/C if not used.		

#### Notes:

1. SOM-6868 is not support.

#### 2.3.3. PCI Express Lane Configurations - Per COM Express Spec

According to the COM Express specification, the general purpose PCIe lanes on the A-B connector can be configured as up to eight PCI Express x1 links or may be combined into various combinations of x8, x4, x2 and x1 links that add up to a total of 8 lanes. These configuration possibilities are based on the COM Express Module's chip-set capabilities.

The COM Express specification defines a "fill order" from mapping PCIe links that are wider than x1 onto the COM Express pins. For example, the spec requires that a x4 PCI Express link be mapped to COM Express PCI Express lanes 0,1,2 and 3. Refer to the COM Express specification for details.

Note: All PCI Express devices are required to work in x1 mode as well as at their full capability. A x4 PCIe card for example is required by the PCI Express specification to be usable in x4 and / or x1 mode.

#### 2.3.4. PCI Express\* General Routing Guidelines

#### 2.3.4.1. PCI Express Insertion Loss Budget with Slot Card

PCI Express Insertion Loss Budget, 1.25 GHz with Carrier Board Slot Card

The module transmit and receive insertion loss budgets are different due to the presence of the coupling caps in the module transmit path. The module transmit path insertion loss budget shall be 4.65 dB (3.46 dB + 1.19 dB). The module receive path insertion loss budget shall be 3.46 dB. COM Express connector loss is accounted for separately.

The Carrier Board transmit and receive insertion loss budgets are the same in this case. The Carrier Board insertion loss budget shall be 4.40 dB. COM Express connector and slot card connector losses are accounted for separately.

The slot card transmit and receive insertion loss budgets are different due to the presence of the coupling caps in the slot card's transmit path. The slot card's transmit path insertion loss budget is 3.84 dB (2.65 dB + 1.19 dB) per the PCI Express Card Electromechanical Specification Revision 1.1. The slot card's receive path insertion loss budget is 2.65 dB per the same specification. Slot card connector loss is accounted for separately.

Segment	Loss (dB)	
	max. Length	Notes
	[mm/inches]	
L <sub>A</sub>	3.46	Allowance for 5.15 inches of module trace 3.45 dB loss @ 0.28 dB / GHz
	130/5.15	/ inch and 1.66 dB crosstalk allowance. Coupling caps not included.
Coupling	1.19	1.19 dB loss. From PCI Express Card Electromechanical Spec., Rev.
Caps		1.1, parameters (L <sub>ST</sub> – L <sub>SR</sub> ). Includes crosstalk allowance of 0.79 dB.
L <sub>B</sub>	0.25	COM Express connector at 1.25 GHz measured value: 0.25 dB loss.
L <sub>C</sub>	4.4	Allowance for 9 inches of Carrier Board trace 4.40 db loss @ 0.28 dB /
	228/9.0	GHz / inch and a 1.25 dB crosstalk allowance.
L <sub>D</sub>	1.25	1.25 dB loss. PCI Express Card Electromechanical Spec Rev 1.1 "guard
		band" allowance for slot connector – includes 1.0 dB connector loss.
L <sub>E</sub>	2.65	2.65 dB loss. From PCI Express Card Electromechanical Spec., Rev.
		1.1(without coupling caps; L <sub>AR</sub> ). Implied crosstalk allowance is 1.25 dB.
Total	13.20	13.20 dB loss.

#### PCI Express Insertion Loss Budget, 2.5 GHz with Carrier Board Slot Card

For "device up" PCIe Gen 2 operation, the Module PCIe maximum trace length is restricted to 5.0 inches and the Carrier Board maximum trace to 4.45 inches. Shorter lengths will yield additional margin and are encouraged where possible. Results assumed FR4 dielectrics.

Other dielectrics with lower losses could be considered, but were not simulated.

It should be noted that a use case exists that might result in reduced PCI Express bandwidth. This use case is tied to Carrier boards with a PCI Express slot (device up). PCI Express Gen 1 and Gen 2 signaling rates use the same PCI Express connector – there is no mechanical keying mechanism to identify the capabilities of the PCI Express slot or the PCI Express board plugged into the slot. This can lead to the situation where the Module and PCI Express board attempt a PCI Express Gen2 signaling rate connection over a Carrier that does not meet the routing guidelines for Gen 2 signaling rates. In a worst case scenario the devices might connect at Gen2 signaling rate with a high number of errors impacting the actual data throughput. It should be noted that there is a Carrier EEPROM on the Carrier which would allow the Module to determine the Carrier board capabilities but this is not a requirement in COM.0.

Segment	max. Length [mm/inches]	Notes
L <sub>A</sub>	127/5.0	Allowance for module trace. Coupling cap effects included within simulation.
L <sub>B</sub>		COM Express connector simulated at 2.5 GHz.
L <sub>C</sub>	113/4.45	Allowance for Carrier Board.
L <sub>D</sub>		PCI Express Card slot connector simulated at 2.5 GHz.
L <sub>E</sub>	80/3.15	Slot Card trace length from PCI Express Card Electromagnetical Spec., Rev. 1.1
Total	320/12.6	PCIe GEN2 Data clocked architecture

#### 2.3.4.2. PCI Express Insertion Loss Budget with Carrier Board PCIE Device

PCI Express Insertion Loss Budget, 1.25 GHz with Carrier Board PCIE Device

The module transmit and receive insertion loss budgets are different due to the presence of the coupling caps in the module transmit path. The module transmit path insertion loss budget shall be 4.65 dB (3.46 dB + 1.19 dB). The module receive path insertion loss budget shall be 3.46 dB. COM Express connector loss is accounted for separately.

The Carrier Board transmit and receive insertion loss budgets are different due to the presence of the coupling caps in the Carrier Board transmit path. The Carrier Board transmit path insertion loss budget shall be 9.49 dB (8.30 dB + 1.19 dB). The Carrier Board receive path insertion loss shall be 8.30 dB. COM Express connector loss is accounted for separately.

Segment	Loss (dB)		
	max. Length	Notes	
	[mm/inches]		
L <sub>A</sub>	3.46	Allowance for 5.15 inches of module trace 3.46 dB loss @ 0.28 dB / GHz / inch	
	131/5.15	and 1.66 dB crosstalk allowance. Coupling caps not included.	
Coupling	1.19	1.19 dB loss. From PCI Express Card Electromechanical Spec., Rev. 1.1,	
Caps		parameters (LST- LSR). Includes crosstalk allowance of 0.79 dB.	
L <sub>B</sub>	0.25	COM Express connector at 1.25 GHz measured value: 0.25 dB loss.	
L <sub>C</sub>	8.3	Allowance for 15.85 inches of Carrier Board trace 8.30 dB loss @ 0.28 dB / GHz /	
	113/4.45	inch and a 2.75 dB crosstalk allowance.	
Total	13.2	13.2dB loss	

#### PCI Express Insertion Loss Budget, 2.5 GHz with Carrier Board PCIE Device

For "device down" PCIe Gen 2 operation, the Module PCIe maximum trace length is restricted to 5.0 inches and the Carrier Board maximum trace to 8.0 inches. Shorter lengths will yield additional margin and are encouraged where possible. Results assumed FR4 dielectrics. Other dielectrics with lower losses could be considered, but were not simulated.

Segment	max. Length [mm/inches]	Notes
L <sub>A</sub>	127/5	Allowance for module trace. Coupling cap effects included within simulation.
L <sub>B</sub>		COM Express™ connector simulated at 2.5 GHz.
L <sub>C</sub>	203/8	Allowance for Carrier Board trace.
Total	330/13.0	PCIe GEN2 Data clocked architecture

#### Notes:

1. AC caps are recommended to be placed close to PCIe device side (avoid placing AC cpas on mid-bus).

## 2.4 PEG (PCI Express Graphics) \*SOM-6868 is not support PEG.

#### 2.4.1 PEG Signal Definitions

The PEG Port can utilize COM Express PCIe lanes 16-31 and is suitable to drive a link for an external high-performance PCI Express Graphics card, if implemented on the COM Express Module.

Graphics Cards implemented as x16 use COM Express PCle lanes 16-31; Graphics Cards implemented as x8 lanes should use COM Express PCle lanes 16-23. Each lane of the PEG Port consists of a receive and transmit differential signal pair designated 'PEG\_RX0' (+ and -) to 'PEG\_RX15' (+ and -) and correspondingly from 'PEG\_TX0' (+ and -) to 'PEG\_TX15' (+ and -). The corresponding signals can be found on the Module connector rows C and D.

1. SOM-6868 is not support PEG.

## 2.4.2. PEG\* General Routing Guidelines

#### **PEG Configuration**

The COM Express PCIe Graphics (PEG) Port is comprised of COM Express PCIe lanes 16-31.

The primary use of this set of signals is to interface to off-Module graphics controllers or cards.

If the PEG interface is not used for an external graphics card SDVO, it may be possible to use these PCIe lanes for other Carrier Board PCIe devices. The details of this usage are Module and Module chip-set dependent. Operation in a x1 link is also supported. Wider links (x2, x4, x8, x16) are chip-set dependent. Refer to the Module product documentation for details.

The COM Express specification defines a fill order for this set of PCle lanes. Larger link widths go to the lower lanes. Refer to the COM Express specification for details.

#### Using PEG Pins for General Purpose PCle Lanes

The COM Express PEG lanes may be used for general-purpose use if the PEG port is not being used as an interface to an external graphics device. The characteristics of this usage are Module and chip-set dependent.

Modules that employ desktop and mobile chip-sets with PEG capability can usually be set up to allow the COM Express PEG lanes to be configured as a single general purpose PCIe link, with link width possibilities of x1, x4, x8 or x16. The x1 configuration should always work; the wider links may be Module and chip-set dependent. Check with your vendor.

Modules based on server-class chip-sets may allow multiple links over the PEG lanes – for example, a x8 link on COM Express PCle lanes 16 through 23 and a x4 link over lanes 24 through 27. This is Module and chip-set dependent.

# 2.4.3. PEG\* Trace Length Guidelines

Figure 4: Topology for PCI Express Slot Card.

Figure 5: Topology for PCI Express Device Down.

Table 7: PCI Express\* Slot Card / Device Down Trace Length Guidelines

Parameter	Main Route Guidelines	Notes
Signal Group	PCI Express* expansion	2
Differential Impedance Target	NA	2
Single End	NA	2
Isolation to equivalent pairs	20 mils (MS) and 15 mils (DS)	2
Isolation to other signal groups	20 mils (MS) and 15 mils (DS)	2
Tx/Rx Spacing	20 mils	2
LA + LB	NA	2
Lc	Carrier Board Length	
Max length of LA+LB+LC	Slot Card: NA	2
	Device Down: NA	
Length matching	Differential pairs (intra-pair): Max. NA	2
	REFCLK+ and REFCLK- (intra-pair):Max. NA	
Reference Plane	GND referencing preferred	
	Min 40-mil trace edge-to-major plane edge spacing	
	GND stitching vias required next to signal vias if	
	transitioning layers between GND layers	
	Power referencing acceptable if stitching caps are	
	used	
Carrier Board Via Usage	Max. 2 vias per TX trace, Max. 4 vias per RX trace	2
AC coupling	The AC coupling capacitors for the TX lines are	1
	incorporated on the COM Express Module. The AC	
	coupling capacitors for RX signal lines have to be	
	implemented on the customer COM Express Carrier Board.	
	Capacitor type: X7R, 100nF ±10%, 16V, shape 0402.	

- 1. AC caps are recommended to be placed close to PCIe device side (avoid placing AC cpas on mid-bus).
- 2. SOM-6868 is not support PEG.

## 2.5 Digital Display Interfaces (DDI)

Module Types 6 use Digital Display Interfaces (DDI) to provide DisplayPort, HDMI/DVI, and SDVO interfaces. Type 6 Modules can contain up to 3 DDIs (DDI[1:3]) of which DDI[1:3] can support DisplayPort, HDMI/DVI and DDI[1] can support DisplayPort, HDMI/DVI, and SDVO.

The main difference is that SDVO is only supported DDI[1] for Type 6 Modules.

#### DisplayPort / HDMI / DVI

DisplayPort was developed by the Video Electronics Standard Association (VESA) in order to create a new digital display port interface to connect a video source to a display device.

DisplayPort can be used to transfer audio and video at the same time, but each one is optional and can be transmitted without the other. A bi-directional, half-duplex auxiliary channel carries device management and device control data for the Main Link, such as VESA EDID.

DisplayPort is nowadays on almost all COM Express Modules available as Dual-mode DisplayPort, that can directly emit single-link HDMI and DVI signals using an adapter, which contains a level shifter to adjust for the lower voltages required by DisplayPort. These adapters can be directly implemented on the Carrier Board to have an easy, simple and future proof implementation of HDMI and/or DVI or an inexpensive cable adapter can be directly connected on the Carrier Board's DisplayPort connector.

## 2.5.1. DDI Signal Definitions

Type 6 Modules up to 3 DisplayPort interfaces.

Each DisplayPort interface consists of 4 differential lanes, 1 auxiliary lane and 1 hot-plug-detect signal. The DDC\_AUX\_SEL pin should be routed to pin 13 of the DisplayPort connector, to enable Dual-Mode. When HDMI/DVI is directly done on the Carrier Board, this pin shall be pulled to 3.3V with a 100k Ohm resistor to configure the AUX pairs as DDC channels.

Table 8: Port / HDMI / DVI Pin-out of Type 6

Pin Name	DDI1	DDI2	DDI3	Function (DDIX)	Function (DDIX)
	Pin#	Pin#	Pin#	DisplayPort	HDMI / DVI
DDIX_PAIR0+	D26	D39	C39	DPX_LANE0+	TMDSX_DATA2+

DDIX_CTRLCLK_AUX-	D16	C33	C37	DPX_AUX-	HDMIX_CTRLDATA
DDIX_DDC_AUX_SEL	D34	C34	C38		

Note: Please verify in the Module's specification if DisplayPort or Dual-Mode DisplayPort is supported.

Table 9: DDI1 Signal Description

Signal	Pin#	Description	I/O	Notes
DDI1_PAIR0+	D26	DDI channel 1, differential pairs 0.	O PCIE	
DDI1_PAIR0-	D27	Carrier Board:	OPCIE	
		For DP, connect AC Coupling Capacitors 75~200		
		nF near COME to device or DP connector.		
		For HDMI / DVI, connect AC Coupling Capacitors		
		75~200 nF near COME and Level Shifter to HDMI or		
		DVI connector.		
		N/C if not used.		
DDI1_PAIR1+	D29	DDI channel 1, differential pairs 1.	O PCIE	
DDI1_PAIR1-	D30	Carrier Board:	OPCIE	
		For DP, connect AC Coupling Capacitors 75~200		
		nF near COME to device or DP connector.		
		For HDMI / DVI, connect AC Coupling Capacitors		
		75~200 nF near COME and Level Shifter to HDMI or		
		DVI connector.		
		N/C if not used.		
DDI1_PAIR2+	D32	DDI channel 1, differential pairs 2.	O PCIE	
DDI1_PAIR2-	D33	Carrier Board:	OPCIE	
		For DP, connect AC Coupling Capacitors 75~200		
		nF near COME to device or DP connector.		
		For HDMI / DVI, connect AC Coupling Capacitors		
		75~200 nF near COME and Level Shifter to HDMI or		
		DVI connector.		
		N/C if not used.		
DDI1_PAIR3+	D36	DDI channel 1, differential pairs 3.	O DOIE	
DDI1_PAIR3-	D37	Carrier Board:	O PCIE	
		For DP, connect AC Coupling Capacitors 75~200		
		nF near COME to device or DP connector.		
		For HDMI / DVI, connect AC Coupling Capacitors		
		75~200 nF near COME and Level Shifter to HDMI or		
		DVI connector.		
		N/C if not used.		

DDI1_HPD  C24  DDI channel 1, Hot-Plug Detect. Module has integrated current blocking circuit and PD resistor to GND Carrier Board: For DP, connector to device or DP connector HP pin. For HDMI / DVI, connect 3.3V to 5V Level Shifter to device, HDMI or DVI PD ping. NC if not used.  DDI1_CTRLCLK_AUX+ DDI6 DDC_AUX_SEL is no connect. Half-duplex bi-directional AUX channel for services such as link configuration or maintenance and EDID access. Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX- Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I2C function. DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCK_AUX- If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.	Signal	Pin#	Description	I/O	Notes
and PD resistor to GND Carrier Board: For DP, connector to device or DP connector HP pin. For HDMI / DVI, connect 3.3V to 5V Level Shifter to device, HDMI or DVI PD ping. NC if not used.  DDI1_CTRLCLK_AUX+ DDI6_DDC_AUX_SEL is no connect. Half-duplex bi-directional AUX channel for services such as link configuration or maintenance and EDID access. Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX-Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI PC function. DDC_AUX_SEL is pulled high. 3.3V Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLCLK_AUX- If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.	DDI1_HPD	C24	DDI channel 1, Hot-Plug Detect.	I 3.3V	
Carrier Board: For DP, connector to device or DP connector HP pin. For HDMI / DVI, connect 3.3V to 5V Level Shifter to device, HDMI or DVI PD ping. NC if not used.  DDI1_CTRLCLK_AUX+ DDI1_CTRLCLK_AUX- DDI6 DDC_AUX_SEL is no connect. Half-duplex bi-directional AUX channel for services such as link configuration or maintenance and EDID access. Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX-Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I²C function. DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX- If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			Module has integrated current blocking circuit	COMS	
For DP, connector to device or DP connector HP pin. For HDMI / DVI, connect 3.3V to 5V Level Shifter to device, HDMI or DVI PD ping. NC if not used.  DDI1_CTRLCLK_AUX+ DDI1_CTRLCLK_AUX- DDI6 DDC_AUX_SEL is no connect. Half-duplex bi-directional AUX channel for services such as link configuration or maintenance and EDID access. Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX-Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI   2C function. DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX- If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			and PD resistor to GND		
HP pin. For HDMI / DVI, connect 3.3V to 5V Level Shifter to device, HDMI or DVI PD ping. NC if not used.  DDI1_CTRLCLK_AUX+ DDI1_CTRLCLK_AUX- DDI6 DDC_AUX_SEL is no connect. Half-duplex bi-directional AUX channel for services such as link configuration or maintenance and EDID access. Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX-Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI   PC function. DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			Carrier Board:		
For HDMI / DVI, connect 3.3V to 5V Level Shifter to device, HDMI or DVI PD ping. NC if not used.  DDI1_CTRLCLK_AUX+ DDI1_CTRLCLK_AUX- D16 DDC_AUX_SEL is no connect. Half-duplex bi-directional AUX channel for services such as link configuration or maintenance and EDID access. Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX- Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I2C function. DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX- If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			For DP, connector to device or DP connector		
Shifter to device, HDMI or DVI PD ping. NC if not used.  DDI1_CTRLCLK_AUX+ DDI1_CTRLCLK_AUX- D16 DDC_AUX_SEL is no connect. Half-duplex bi-directional AUX channel for services such as link configuration or maintenance and EDID access. Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX- Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I2C function. DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			HP pin.		
DDI1_CTRLCLK_AUX+ DDI1_CTRLCLK_AUX- DDI1_CTRLCLK_AUX- DDI6 DDC_AUX_SEL is no connect. Half-duplex bi-directional AUX channel for services such as link configuration or maintenance and EDID access. Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX- Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I2C function. DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLCLK_AUX+ and DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX- If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			For HDMI / DVI, connect 3.3V to 5V Level		
DDI1_CTRLCLK_AUX+ DDI1_CTRLCLK_AUX- DDI6 DDC_AUX_SEL is no connect. Half-duplex bi-directional AUX channel for services such as link configuration or maintenance and EDID access. Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX- Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I2C function. DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLCLK_AUX+ and DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX- If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			Shifter to device, HDMI or DVI PD ping.		
DDI1_CTRLCLK_AUX-  D16  DDC_AUX_SEL is no connect. Half-duplex bi-directional AUX channel for services such as link configuration or maintenance and EDID access. Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX- Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I²C function. DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34  Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLCLK_AUX+. If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			NC if not used.		
Half-duplex bi-directional AUX channel for services such as link configuration or maintenance and EDID access.  Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX- Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I²C function. DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.	DDI1_CTRLCLK_AUX+	D15	DDI channel1, DP AUX function.	I/O PCIE	
services such as link configuration or maintenance and EDID access.  Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX- Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I2C function. DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.	DDI1_CTRLCLK_AUX-	D16	DDC_AUX_SEL is no connect.		
maintenance and EDID access.  Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX- Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I²C function. DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			Half-duplex bi-directional AUX channel for		
Module has integrated AC Coupling Capacitor, AUX+ PD resistor to GND and AUX- Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I <sup>2</sup> C function. I/O OD DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			services such as link configuration or		
Capacitor, AUX+ PD resistor to GND and AUX- Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I²C function. DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			maintenance and EDID access.		
AUX- Pull up to 3.3V. Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I²C function. I/O OD DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			Module has integrated AC Coupling		
Carrier Board: Connect to device or DP connector. N/C if not used.  DDI channel1, HDMI / DVI I²C function. I/O OD DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34  Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			Capacitor, AUX+ PD resistor to GND and		
Connect to device or DP connector.  N/C if not used.  DDI channel1, HDMI / DVI I2C function.  DDC_AUX_SEL is pulled high.  Carrier Board:  Connect 3.3V-5V Level Shifter to device,  HDMI or DVI connector.  N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of  DDI1_CTRLCLK_AUX+ and  DDI1_CTRLDATA_AUX  If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			AUX- Pull up to 3.3V.		
N/C if not used.  DDI channel1, HDMI / DVI I²C function.  DDC_AUX_SEL is pulled high.  Carrier Board:  Connect 3.3V-5V Level Shifter to device,  HDMI or DVI connector.  N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of  DDI1_CTRLCLK_AUX+ and  DDI1_CTRLDATA_AUX  If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			Carrier Board:		
DDI channel1, HDMI / DVI I²C function.  DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			Connect to device or DP connector.		
DDC_AUX_SEL is pulled high. Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34  Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			N/C if not used.		
Carrier Board: Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34  Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			DDI channel1, HDMI / DVI I2C function.	I/O OD	
Connect 3.3V-5V Level Shifter to device, HDMI or DVI connector. N/C if not used.  DDI1_DDC_AUX_SEL  D34  Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			DDC_AUX_SEL is pulled high.	3.3V	
HDMI or DVI connector.  N/C if not used.  DDI1_DDC_AUX_SEL  D34  Selects the function of  DDI1_CTRLCLK_AUX+ and  DDI1_CTRLDATA_AUX  If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			Carrier Board:	COMS	
DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			Connect 3.3V-5V Level Shifter to device,		
DDI1_DDC_AUX_SEL  D34 Selects the function of DDI1_CTRLCLK_AUX+ and DDI1_CTRLDATA_AUX If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			HDMI or DVI connector.		
DDI1_CTRLCLK_AUX+ and COMS  DDI1_CTRLDATA_AUX  If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			N/C if not used.		
DDI1_CTRLDATA_AUX  If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.	DDI1_DDC_AUX_SEL	D34	Selects the function of	I 3.3V	
If this input is floating the AUX pair is used for the DP AUX+/- signals. If pulled-high the AUX pair contains the CRTLCLK and CTRLDATA signals.			DDI1_CTRLCLK_AUX+ and	COMS

## 2.5.2 Digital Display Interfaces (DDI) Routing Guidelines

## 2.5.2.1. DisplayPort Routing Guidelines

Carriers that support DisplayPort (DisplayPort only or dual mode):

- DC blocking capacitors shall be placed on the Carrier for the DDI[n]\_PAIR[0:3] signals.
- The Carrier shall include a blocking FET on DDI[n]\_HPD to prevent back-drive current from damaging the Module.

When implementing DisplayPort on the Carrier Board, the DP\_AUX+ line shall have a pulldown resistor to GND. The resistor value should be  $100k\Omega$ . The DP\_AUX- line shall have a pull-up resistor to 2.5V. The resistor value should be  $100k\Omega$ . The resistors shall be placed on the DisplayPort connector side of the AC coupling capacitors. The DP\_HP signal shall include a blocking FET to prevent back-drive current damage. The DP\_HP signal shall be pulled-down to GND with a  $110k\Omega$  resistor.

The DDI signals can be used to support a variety of video interfaces. The circuits required to realize the different video interfaces will be determined by a future PICMG Carrier Design Guide subcommittee. At this time, they only requirement placed on Modules for the DDI signals is the maximum trace length specified below.

Max length of LA+LB	DDI differential pairs to DP connector: 5"	
	Embedded DisplayPort: 4"	
	AUX channel: 10"	
Length matching	Differential pairs (intra-pair): Max. ±2.5 mils	
	For each channel, match the lengths of the differential	
	pairs (Inter-Pair) to be within a 1-inch window (max	
	length – min length < 1 inch (2.54 cm)).	
Reference Plane	GND referencing preferred.	
	Min 40-mil trace edge-to-major plane edge	
	spacing.	
Carrier Board Via Usage	Max. 2 vias.	
AC coupling	Min = 75 nF	1
	Max = 200 nF	

1. AC caps are recommended to be placed close to device side (avoid placing AC cpas on mid-bus).

#### 2.5.2.2. HDMI / DVI Routing Guidelines

When implementing HDMI level shifters shall be used on the TMDS signals. Bi-directional level shifters shall be used between the 3.3V and 5V CTRLCLK and CTRLDATA signals with  $2.2k\Omega$  pull-ups to 3.3V and 5V. Carriers that support TMDS (DVI/HDMI):

- DDI[n]\_DDC\_AUX\_SEL shall be pulled to 3.3V on the Carrier with a 100K Ohm resistor to configure the DDI[n]\_AUX pair as the DDC channel.
- Bi-directional level translators shall be placed on the Carrier DDI[n]\_CTRLDATA\_AUX- and DDI[n]\_CTRLCLK\_AUX+ to convert the 3.3V DDC channel on the Module to the 5V DDC channel for the TMDS display.
- Pull-up resistors shall be placed on the Carrier from 3.3V (Module side of level translator) and 5V (display side of level translator) and the [n]\_CTRLDATA\_AUX- and DI[n]\_CTRLCLK\_AUX+ signals. The pull-up resistor should be 2k.
- Level translators Shall be placed on the Carrier DDI[n]\_PAIR[0:3] signals.
- DC blocking capacitors shall be placed on the Carrier for the DDI[n]\_PAIR[0:3] signals.
- The Carrier shall include a blocking FET on DDI[n]\_HPD to prevent back-drive current from damaging the module.

The DDI signals can be used to support a variety of video interfaces. The circuits required to realize the different video interfaces will be determined by a future PICMG Carrier Design Guide subcommittee. At this time, they only requirement placed on Modules for the DDI signals is the maximum trace length specified below.

	Max = 200 nF	

1. AC caps are recommended to be placed close to device side (avoid placing AC cpas on mid-bus).

#### 2.5.3. HDMI / DVI Level Shifter Requirements

The HDMI specification requires the receiver to be terminated to AVCC (nominally 3.3 V) through Rt (nominally 50  $\Omega$ ). The HDMI receiver requirements require the native HDMI signals from the SOC to be level shifted. This prevents electrical overstress of the driver and ensure that the receiver is operational within the receiver specifications defined in the *High Definition Multimedia Interface Specification 1.4a*.

#### 2.5.4. ESD Protection

HDMI signals are subjected to ESD strikes due to plugging in of the devices through the HDMI cable and frequent human contact that can destroy both the HDMI host and devices on the platform. Therefore these ports need to be protected.

There are a wide variety of ESD protection devices and ESD suppressors readily available in the market such as Metal Oxide Varistors (MOVs), Zener Diode, Transient Voltage Suppressor (TVS), Polymer devices and ESD diode arrays. With 1.65 Gbps of data rate, HDMI is very sensitive to parasitic capacitance. Excessive parasitic capacitance can severely degrade the signal integrity and lead to a compliance or operational failure. To maintain signal integrity, Intel recommends to use ESD suppressors or diode arrays having a low junction capacitance.

Recommended characteristics of an ideal ESD Protection Diode for HDMI:

- Able to withstand at least 8 kV of ESD strikes.
- Low capacitance <1 pF to minimize signal distortion at high data rates as higher capacitance degrade the HDMI signal quality.
- Fast response/rise time to protect from the fast rise time of ESD surge pulses.
- Low-leakage current to minimize static power consumption.
- Ensure the selected ESD solution will not violate HDMI Voff spec. In a low power state a power rail ESD diode can become forward biased as a result on the HDMI sink (panel) termination of 50  $\Omega$  to 3.3 V
- Some ESD devices may impact the trace impedance. Care should be taken while choosing such devices so that the differential-impedance target in the *HDMI 1.4 Specification* is not violated.

The *HDMI 1.4a Specification* requires that 8 kV of ESD strikes be tolerated.

The ESD protection devices should be placed as close to the HDMI connector as possible so that when ESD strikes occur, the discharges can be quickly absorbed or diverted to the ground/power plane before it is coupled to another signal path nearby.

Footprints for ESD components or diode arrays can be provided on board with no stubs and no more than 750 mils (19.05 mm) from the connector. The ESD components can be stuffed depending on the requirement.

# 2.6. LAN Interface

All COM Express Modules provide at least one LAN port. The 8-wire 10/100/1000BASE-T Gigabit Ethernet interface compliant to the IEEE 802.3-2005 specification is the preferred interface for this port, with the COM Express Module PHY responsible for implementing auto-negotiation of 10/100BASE-TX vs 10/100/1000BASE-T operation. The carrier may also support a 4-wire 10/100BASE-TX interface from the COM Express Module on an exception basis. Check with your vendor for 10/100 only implementations.

## 2.6.1. LAN Signal Definitions

The LAN interface of the COM Express Module consists of 4 pairs of low voltage differential pair signals designated from 'GBE0\_MDI0'(+ and -) to 'GBE0\_MDI3'(+ and -) plus additional control signals for link activity indicators. These signals can be used to connect to a 10/100/1000BASE-T RJ45 connector with integrated or external isolation magnetics on the Carrier Board. The corresponding LAN differential pair and control signals can be found on rows A and B of the Module's connector.

Table 16: LAN Interface Signal Descriptions

## 2.6.2. LAN Routing Guidelines

#### 10/100/1000 Ethernet Insertion Loss Budget

Figure 10: 10/100/1000 Ethernet Insertion Loss Budget

COM Express Ethernet implementations should conform to insertion loss values less than or equal to those shown in the table above. The insertion loss values shown account for frequency dependent material losses only. Cross talk losses are separate from material losses in the Gb Ethernet specification.

"Device Down" implementations, in which the Ethernet target device is implemented on the Carrier Board (for instance, an Ethernet switch), may add the insertion loss for the RJ45 Ethernet jack and integrated magnetics to the Carrier Board budget. This insertion loss value is typically 1 dB. The Carrier Board insertion loss budget then becomes LC + 1 dB, or 1.15 dB.

Table 17: 10/100/1000 Ethernet Insertion Loss Budget, 100 MHz

Segment	Loss (dB)	Notes
L <sub>A</sub>	0.08	Up to 3 inches of module trace @ 0.28 dB / GHz / inch
L <sub>B</sub>	0.02	COM Express connector at 100 MHz measured value
L <sub>C</sub>	0.15	Up to 5 inches of Carrier Board trace @ 0.28 dB / GHz / inch

	RX and TX pairs (inter-pair) - Max. ±15mils	
Reference Plane	GND referencing preferred	
Spacing from edge of plane	Min. 40mils	
Carrier Board Via Usage	Max. 2 vias.	

Notes:

## 2.6.4. Reference Ground Isolation and Coupling

The Carrier Board should maintain a well-designed analog ground plane around the components on the primary side of the transformer between the transformer and the RJ-45 receptacle. The analog ground plane is bonded to the shield of the external cable through the RJ-45 connector housing.

The analog ground plane should be coupled to the carrier's digital logic ground plane using a capacitive coupling circuit that meets the ground plane isolation requirements defined in the 802.3-2005 specification. It is recommended that the Carrier Board PCB design maintain a minimum 30 mil gap between the digital logic ground plane and the analog ground plane.

It's recommended to place an optional GND to SHIELDGND connection near the RJ-45 connector to improve EMI and ESD capabilities.

## 2.7. USB2.0 Ports

A COM Express Module must support a minimum of 4 USB Ports and can support up to 8 USB Ports. All of the USB Ports must be USB2.0 compliant. There are 4 over-current signals shared by the 8 USB Ports. A Carrier must current limit the USB power source to minimize disruption of the Carrier in the event that a short or over-current condition exists on one of the USB Ports. A Module must fill the USB Ports starting at Port 0. The USB SuperSpeed ports 0, 1, 2 and 3, if used, are to be paired with USB 2.0 ports 0, 1, 2 and 3 in the same order. The USB SuperSpeed ports use the same over current signaling mechanism as the USB 2.0 ports, but USB 3.0 allows up to 1A current per port instead of 500mA allowed in USB 2.0. Although USB 2.0 signals use differential signaling, the USB specification also encodes single ended state information in the differential pair, making EMI filtering somewhat challenging. Ports that are internal to the Carrier do not need EMI filters. A USB Port can be powered from the Carrier Main Power or from the Carrier Suspend Power. Main Power is used for USB devices that are accessed when the system is powered on. Suspend Power (VCC\_5V\_SBY) is used for devices that need to be powered when the Module is in Sleep-State S5. This would typically be for USB devices that support Wake-on-USB. The amount of current available on VCC\_5V\_SBY is limited so it should be used sparingly.

## 2.7.1.1. USB Over-Current Protection (USB\_x\_y\_OC#)

The USB Specification describes power distribution over the USB port, which supplies power for USB devices that are directly connected to the Carrier Board. Therefore, the host must implement over-current protection on the ports for safety reasons. Should the aggregate current drawn by the downstream ports exceed a permitted value, the over-current protection circuit removes power from all affected downstream ports. The over-current limiting mechanism must be resettable without user mechanical intervention. For more detailed information about this subject, refer to the 'Universal Serial Bus Specifications Revision 2.0', which can be found on the website http://www.usb.org.

Over-current protection for USB ports can be implemented by using power distribution switches on the Carrier Board that monitor the USB port power lines. Power distribution switches usually have a soft-start circuitry that minimizes inrush current in applications where highly capacitive loads are employed. Transient faults are internally filtered.

Additionally, they offer a fault status output that is asserted during over-current and thermal shutdown conditions. These outputs should be connected to the corresponding COM Express Modules USB over-current sense signals. Fault status signaling is an option at the USB specification. If you don't need the popup message in your OS you may leave the signals USB\_0\_1\_OC#, USB\_2\_3\_OC#, USB\_4\_5\_OC# and USB\_6\_7\_OC# unconnected.

Simple resettable PolySwitch devices are capable of fulfilling the requirements of USB overcurrent protection and therefore can be used as a replacement for power distribution switches.

Fault status signals are connected by a pullup resistor to VCC\_3V3\_SBY on COM Express Module. Please check your tolerance on a USB port with VCC\_5V supply.

#### 2.7.1.2. Powering USB devices during S5

The power distribution switches and the ESD protection shown in the schematics can be powered from Main Power or Suspend Power (VCC\_5V\_SBY). Ports powered by Suspend Power are powered during the S3 and S5 system states. This provides the ability for the COM Express Module to generate system wake-up events over the USB interface.

## 2.7.2. USB2.0 Routing Guidelines

#### **USB Insertion Loss Budget**

Figure 12: USB Insertion Loss Budget

COM Express USB implementations should conform to insertion loss values less than or equal to those shown in the table above. The insertion loss values shown account for frequency dependent material losses only. Cross talk losses are separate from material losses in the USB specification.

"Device Down" implementations, in which the USB target device is implemented on the Carrier Board, may add the ferrite and USB connector insertion loss values to the Carrier Board budget.

The Carrier Board insertion loss budget then becomes LC + LD, or 2.68 dB.

Table 20: USB Insertion Loss Budget, 400 MHz

Segment	Loss (dB)	Notes
L <sub>A</sub>	0.67	Up to 6 inches of module trace @ 0.28 dB / GHz / inch
L <sub>B</sub>	0.05	COM Express connector at 400 MHz measured value
L <sub>C</sub>	1.68	Up to 14 inches of Carrier Board trace @ 0.28 dB / GHz / inch
L <sub>D</sub>	1.00	USB connector and ferrite loss
L <sub>E</sub>	5.80	USB cable and far end connector loss, per source specification
Total	9.20	

#### 2.7.2.1. USB 2.0 General Design Considerations and Optimization

Use the following general routing and placement guidelines when laying out a new design. These guidelines help minimize signal quality and EMI problems.

- Do not route USB 2.0 traces under crystals, oscillators, clock synthesizers, magnetic devices or ICs that use and/or duplicate clocks.
- Separate signal traces into similar categories, and route similar signal traces together (such as routing differential-pairs together).
- Keep USB 2.0 signals clear of the core logic set. High current transients are produced during internal state transitions and can be very difficult to filter out.
- Follow the 20 x h rule by keeping traces at least [20 x (height above the plane)] mils away from the edge of the plane (VCC or GND). For an example stackup, the height above the plane is 4.5 mils (0.114 mm). This calculates to a 90-mil (2.286-mm) spacing requirement from the edge of the plane. This helps prevent the coupling of the signal onto adjacent wires and also helps prevent free radiation of the signal from the edge of the PCB.
- Avoid stubs on high-speed USB signals because stubs cause signal reflections and affect signal quality. If a stub is unavoidable in the design, the total of all the stubs on a particular line should not be greater than 200 mils (5.08 mm).

## 2.7.2.2. USB 2.0 Port Power Delivery

The following is a suggested topology for power distribution of VBUS to USB ports.

These circuits provide two types of protection during dynamic attach and detach situations on the bus: inrush current limiting (droop) and dynamic detach flyback protection. These two types require both bulk capacitance (droop) and filtering capacitance (for dynamic detach flyback voltage filtering). Intel recommends the following:

- Minimize the inductance and resistance between the coupling capacitors and the USB ports.
- Place capacitors as close as possible to the port and the power-carrying traces should be as wide as possible, preferably, a plane.
- Make the power-carrying traces wide enough that the system fuse blows on an over current event. If the system fuse is rated at 1 A, then the power-carrying traces should be wide enough to carry at least 1.5 A.

Figure 13: USB 2.0 Good Downstream Power Connection

#### 2.7.2.3. USB 2.0 Common Mode Chokes

Testing has shown that common mode chokes can provide required noise attenuation. A design should include a common mode choke footprint to provide a stuffing option in the event the choke is needed to pass EMI testing. Below figure shows the schematic of a typical common mode choke and ESD suppression components. Place the choke as close as possible to the USB connector signal pins.

Figure 14: USB 2.0 A Common Mode Choke

Common mode chokes distort full-speed and high-speed signal quality. As the common mode impedance increases the distortion increases, therefore test the effects of the common mode choke on full speed and high-speed signal quality. Common mode chokes with a target impedance of 80  $\Omega$  to 90  $\Omega$ , at 100 MHz, generally provide adequate noise attenuation.

Finding a common mode choke that meets the designer's needs is a two-step process:

- 1. Choose a part with the impedance value that provides the required noise attenuation. This is a function of the electrical and mechanical characteristics of the part chosen and the frequency and strength of the noise present on the USB traces that should be suppressed.
- 2. After obtaining a part that gives passing EMI results, the second step is to test the effect this part has on signal quality. Higher impedance common mode chokes generally have a greater damaging effect on signal quality, so care must be used when increasing the impedance without doing thorough testing. Thorough testing means that the signal quality must be checked for low-speed, full-speed, and highspeed USB operation.

Further common mode choke information can be found on the high-speed USB Platform Design Guides available at www.usb.org.

#### 2.7.2.4. EMI / ESD Protection

To improve the EMI behavior of the USB interface, a design should include common mode chokes, which have to be placed as close as possible to the USB connector signal pins.

Common mode chokes can provide required noise attenuation but they also distort the signal quality of full-speed and high-speed signaling. Therefore, common mode chokes should be chosen carefully to meet the requirements of the EMI noise filtering while retaining the integrity of the USB signals on the Carrier Board design.

To protect the USB host interface of the Module from over-voltage caused by electrostatic discharge (ESD) and electrical fast transients (EFT), low capacitance steering diodes and transient voltage suppression diodes have to be implemented on the Carrier Board design. In the USB reference schematics Figure 29 above, this is implemented by using 'SR05 RailClampR' surge rated diode arrays from Semtech (http://semtech.com).

Notes:

## 2.8. USB3.0

USB 3.0 is the third major revision of the Universal Serial Bus (USB) standard for computer connectivity. It adds a new transfer speed called SuperSpeed (SS) to the already existing LowSpeed (LS), FullSpeed (FS) and HighSpeed (HS).

USB 3.0 leverages the existing USB 2.0 infrastructure by adding two additional data pair lines to allow a transmission speed up to 5 Gbit/s, which is 10 times faster than USB 2.0 with 480 Mbit/s.

The additional data lines are unidirectional instead of the bidirectional USB 2.0 data lines. USB 3.0 is fully backward compatible to USB 2.0. USB 3.0 connectors are different from USB 2.0 connectors. The USB 3.0 connector is a super set of a USB 2.0 connector, with 4 additional pins that are invisible to USB 2.0 connectors. A USB 2.0 Type A plug may be used in a USB 3.0 Type A receptacle, but the USB 3.0 SuperSpeed functions will not be available.

#### 2.8.1.1. USB Over-Current Protection (USB\_x\_y\_OC#)

The USB Specification describes power distribution over the USB port, which supplies power for USB devices that are directly connected to the Carrier Board. Therefore, the host must implement over-current protection on the ports for safety reasons. Should the aggregate current drawn by the downstream ports exceed a permitted value, the over-current protection circuit removes power from all affected downstream ports. The over-current limiting mechanism must be resettable without user mechanical intervention. For more detailed information about this subject, refer to the 'Universal Serial Bus Specifications Revision 2.0', which can be found on the website http://www.usb.org.

Over-current protection for USB ports can be implemented by using power distribution switches on the Carrier Board that monitor the USB port power lines. Power distribution switches usually have a soft-start circuitry that minimizes inrush current in applications where highly capacitive loads are employed. Transient faults are internally filtered.

Additionally, they offer a fault status output that is asserted during over-current and thermal shutdown conditions. These outputs should be connected to the corresponding COM Express Modules USB over-current sense signals. Fault status signaling is an option at the USB specification. If you don't need the popup message in your OS you may leave the signals USB\_0\_1\_OC#, USB\_2\_3\_OC#, USB\_4\_5\_OC# and USB\_6\_7\_OC# unconnected.

Fault status signals are connected by a pullup resistor to VCC\_3V3\_SBY on COM Express Module. Please check your tolerance on a USB port with VCC\_5V supply.

USB 2.0 port's VCC current limit should be set to 500mA. For USB 3.0 implementations, the VCC current limit is raised to 1A. A different, USB 3.0 compatible, power switch is used.

#### 2.8.1.2. EMI / ESD Protection

To improve the EMI behavior of the USB interface, a design should include common mode chokes, which have to be placed as close as possible to the USB connector signal pins.

Common mode chokes can provide required noise attenuation but they also distort the signal quality of FullSpeed, HighSpeed and SuperSpeed signaling. Therefore, common mode chokes should be chosen carefully to meet the requirements of the EMI noise filtering while retaining the integrity of the USB signals on the Carrier Board design.

To protect the USB host interface of the Module from over-voltage caused by electrostatic discharge (ESD) and electrical fast transients (EFT), low capacitance steering diodes and transient voltage suppression diodes have to be implemented on the Carrier Board design.

## 2.8.2. USB3.0 Routing Guidelines

#### **USB3.0 Insertion Loss Budget**

Figure 16: USB3.0 Insertion Loss Budget

Table 23: USB3.0 Insertion Loss Budget

Segment	Loss (dB)	Notes
L <sub>A</sub>	1.94	Up to 3 inches of Module trace @ 2.5 GHz
L <sub>B</sub>	1.20	COM Express connector at 2.5 GHz
	2.04	Up to 5 inches of Carrier Board trace @ 2.5 GHz with Common-Mode
L <sub>C</sub>	3.64	Component
Total	6.78	

COM Express USB implementations should conform to insertion loss values less than or equal to those shown in the table above. The insertion loss values shown account for frequency dependent material losses only. Cross talk losses are separate from material losses in the USB specification.

"Device Down" implementations, in which the USB target device is implemented on the Carrier Board, may add the ferrite and USB connector insertion loss values to the Carrier Board budget.

The Carrier Board insertion loss budget then becomes LC + LD, or 2.68 dB.

Carrier Board Via Usage	Max. 3 vias per differential signal trace	

### 2.9. SATA

Support for up to four SATA ports is defined on the COM Express A-B connector. Support for a minimum of two ports is required for all Module Types. The COM Express Specification allows for both SATA-150 and SATA-300 implementations. Constraints for SATA-300 implementations are more severe than those for SATA-150. The COM Express Specification addresses both in the section on insertion losses.

SATA devices can be internal to the system or external. The eSATA specification defines the connector used for external SATA devices. The eSATA interface must be designed to prevent damage from ESD, comply with EMI limits, and withstand more insertion/removals cycles than standard SATA. A specific eSATA connector was designed to meet these needs. The eSATA connector does not have the "L" shaped key, and because of this, SATA and eSATA cables cannot be interchanged.

### 2.9.1. SATA Signal Definitions

Table 25: SATA Signal Definitions

Signal	Pin#	Description	I/O	Note
SATA0_RX+	A19	Serial ATA channel 0, Receive input differential pair.	ISATA

		to 3.3V		
		N/C if not used.		

Notes:

SOM-6868 is not support SATA2 and SATA3.

### 2.9.2. SATA Routing Guidelines

#### SATA Insertion Loss Budget

Figure 18: SATA Insertion Loss Budge

The Serial ATA source specification provides insertion loss figures only for the SATA cable. There are several cable types defined with insertion losses ranging from 6 dB up to 16 dB. Cross talk losses are separate from material losses in the SATA specification.

The COM Express SATA Insertion loss budgets presented below represent the material losses and do not include cross talk losses. The COM Express SATA Insertion loss budgets are a guideline: module and Carrier Board vendors should not exceed the values shown in the tables below.

Table 26: SATA Insertion Loss Budge

SATA Gen 1 Insertion Loss Budget, 1.5 GHz

Segment	Loss (dB)	Notes
L <sub>A</sub>	1.26	Up to 3.0 inches of module trace @ 0.28 dB / GHz / inch
Coupling Caps	0.40	
L <sub>B</sub>	0.25	COM Express connector at 1.5 GHz measured value
Lc	3.07	Up to 7.2 inches of Carrier Board trace @ 0.28 dB / GHz / inch
L <sub>D</sub>	6.00	Source specification cable and cable connector allowance
Total	10.98	

#### SATA Gen 2 Insertion Loss Budget, 3.0 GHz

Segment	Loss (dB)	Notes
L <sub>A</sub>	1.68	Up to 2.0 inches of module trace @ 0.28 dB / GHz / inch
Coupling Caps	0.40	
L <sub>B</sub>	0.38	COM Express connector at 3.0 GHz measured value
Lc	2.52	Up to 3.0 inches of Carrier Board trace @ 0.28 dB / GHz / inch
L <sub>D</sub>	6.00	Source specification cable and cable connector allowance
Total	10.98	

## 2.9.2.1. General SATA Routing Guidelines

Use the following general routing and placement guidelines when laying out a new design.

- SATA signals must be ground referenced. If changing reference plane is completely unavoidable (that is, ground reference to power reference), proper placement of stitching caps can minimize the adverse effects of EMI and signal quality performance caused by reference plane change. Stitching capacitors are small valued capacitors (1 µF or lower in value) that bridge the power and ground planes close to where a high-speed signal changes layers. Stitching caps provide a high frequency current return path between different reference planes. They minimize the impedance discontinuity and current loop area that crossing different reference planes created. The maximum number allowed for SATA to change reference plane is one.
- Route all traces over continuous GND planes, with no interruptions. Avoid crossing over anti-etch if at all possible. Any discontinuity or split in the ground plane can cause signal reflections and should be avoided.
- Minimize layer changes. If a layer change is necessary, ensure that trace matching for either transmit or receive pair occurs within the same layer. Intel recommends to use SATA vias as seldom as possible.
- DO NOT route SATA traces under power connectors, other interface connectors, crystals, oscillators, clock synthesizers, magnetic devices or ICs that use and/or duplicate clocks.
- DO NOT place stubs, test points, test vias on the route to minimize reflection. Utilize vias and connector pads as test points instead.
- For testability, route the TX and RX pairs for a given port on the same layer and close to each other to help ensure that the pairs share similar signaling characteristics. If the groups of traces are similar, a measure of RX pair layout quality can be approximated by using the results from actively testing the TX pair's signal quality.
- Length matching rules are required on SATA differential signals for optimum timing margins, preventing common-mode signals and EMI. Each net within a differential pair should be length matched on a segment-by-segment basis at the point of discontinuity. Total length mismatch must not be more than 20 mils (0.508 mm). Examples of segments might include breakout areas, routes running between two vias, routes between an AC coupling capacitor and a connector pin, etc. The points of discontinuity would be the via, the capacitor pad, or the connector pin.Matching of TX and RX within the same port and between SATA TX and RX pairs from differential ports is not required. When length matching compensation occurs, it should be made as close as possible to the point where the variation occurs.
- DO NOT serpentine to match RX and TX traces; there is NO requirement to match RX and TX traces. In addition, DO NOT serpentine to meet minimum length guidelines on RX and TX traces.
- Recommend keeping SATA traces 20 mils (0.508 mm) from any vias on the motherboard whenever possible.

# 2.9.3. SATA Trace Length Guidelines

Figure 19: Topology for SATA

Spacing from edge of plane	Min. 40mils	
Carrier Board Via Usage	A maximum of 2 vias is recommended.	

## 2.10. LVDS

### 2.10.1. Signal Definitions

The COM Express Specification provides an optional LVDS interface on the COM Express A-B connector. Module pins for two LVDS channels are defined and designated as LVDS\_A and LVDS\_B.

Systems use a single-channel LVDS for most displays. Dual LVDS channels are used for very high-bandwidth displays. Single-channel LVDS means that one complete RGB pixel is transmitted per display input clock. Dual-channel LVDS means that two complete RGB pixels are transmitted per display input clock. The two pixels are adjacent along a display line. Dual-channel LVDS does not mean that two LVDS displays can be driven.

Each COM Express LVDS channel consists of four differential data pairs and a differential clock pair for a total of five differential pairs per channel. COM Express Modules and Module chipsets may not use all pairs. For example, with 18-bit TFT displays, only three of the four data pairs on the LVDS\_A channel are used, along with the LVDS\_A clock. The LVDS\_B lines are not used. The manner in which RGB data is packed onto the LVDS pairs (including packing order and color depth) is not specified by the COM Express Specification. This may be Module-dependent.

There are five single-ended signals included to support the LVDS interface: two lines are used for an I2C interface that may be used to support EDID or other panel information and identification schemes. Additionally, there are an LVDS power enable (LVDS\_VDD\_EN) and backlight control and enable lines (LVDS\_BKLT\_CTRL and LVDS\_BKLT\_EN).

Table 28: LVDS Signal Definitions

Signal	Pin#	Description	I/O	Note

		N/C if not used		

#### 2.10.1.1. Display Timing Configuration

The graphic controller needs to be configured to match the timing parameters of the attached flat panel display. To properly configure the controller, there needs to be some method to determine the display parameters. Different Module vendors provide differing ways to access display timing parameters. Some vendors store the data in non-volatile memory with the BIOS setup screen as the method for entering the data, other vendors might use a Module or Carrier based EEPROM. Some vendors might hard code the information into the BIOS, and other vendors might support panel located timing via the signals LVDS\_I2C\_CK and LVDS\_I2C\_DAT with an EEPROM strapped to 1010 000x. Regardless of the method used to store the panel timing parameters, the video BIOS will need to have the ability to access and decode the parameters. Given the number of variables it is recommended that Carrier designers contact Module suppliers to determine the recommend method to store and retrieve the display timing parameters.

The Video Electronics Standards Association (VESA) recently released DisplayID, a second generation display identification standard that can replace EDID and other proprietary methods for storing flat panel timing data. DisplayID defines a data structure which contains information such as display model, identification information, colorimetry, feature support, and supported timings and formats. The DisplayID data allows the video controller to be configured for optimal support for the attached display without user intervention. The basic data structure is a variable length block up to 256 bytes with additional 256 byte extensions as required. The DisplayID data is typically stored in a serial EPROM connected to the LVDS\_I2C bus. The EPROM can reside on the display or Carrier. DisplayID is not backwards compatible with EDID. Contact VESA (www.vesa.org) for more information.

#### 2.10.1.2. Backlight Control

Backlight inverters are either voltage, PWM or resistor controlled. The COM Express specification provides two methods for controlling the brightness. One method is to use the backlight control and enable signals from the CPU chipset. These signals are brought on COM Express LVDS\_BKLT\_EN and LVDS\_BKLT\_CTRL. LVDS\_BKLT\_CTRL is a Pulse Width Modulated (PWM) output that can be connected to display inverters that accept a PWM input. The second method it to use the LVDS I2C bus to control an I2C DAC. The output of the DAC can be used to support voltage controlled inverters. The DAC can be used driving the backlight voltage control input pin of the inverter.

### 2.10.2. LVDS Routing Guidelines

Route LVDS signals as differential pairs (excluding the five single-ended support signals), with a  $100-\Omega$  differential impedance and a  $55-\Omega$ , single-ended impedance. Ideally, a LVDS pair is routed on a single layer adjacent to a ground plane. LVDS pairs should not cross plane splits. Keep layer transitions to a minimum. Reference LVDS pairs to a power plane if necessary. The power plane should be well-bypassed.

Length-matching between the two lines that make up an LVDS pair ("intra-pair") and between different LVDS pairs ("inter-pair") is required. Intra-pair matching is tighter than the inter-pair matching.

All LVDS pairs should have the same environment, including the same reference plane and the same number of vias.

# 2.10.3. LVDS Trace Length Guidelines

Figure 20: Topology for LVDS

	Data pairs (inter-pair) : Max. ±5 mils	
Reference Plane	GND referencing preferred	
Spacing from edge of plane	Min. 40mils	
Carrier Board Via Usage	Max. of 2 vias per line.	

## 2.11. Embedded DisplayPort (eDP) \*SOM-6868 is Option function

Embedded DisplayPort (eDP) is a digital display interface standard produced by the Video Electronics Standards Association (VESA) for digital interconnect of Audio and Video.

Embedded DisplayPort defines a standardized display panel interface for internal connections; e.g., graphics interfaces to notebook display panels. It supports advanced power-saving features including seamless refresh rate switching, display panel and backlight control protocol that works through the AUX channel, and Panel Self-Refresh (PSR) feature developed to save system power and further extend battery life in portable PC systems. PSR mode allows the GPU to enter power saving states in between frame updates by including framebuffer memory in the display panel controller.

Embedded DisplayPort is intended to replace LVDS as the interface to flat panel displays integrated into a product. Unlike DisplayPort, embedded DisplayPort does not define a specific connector or pin-out. The COM Express specification shares the LVDS pins with embedded DisplayPort.

## 2.11.1 eDP Signal Definitions

eDP is available in Type 6 and type 10 pin-outs as an alternative to the LVDS A channel. The Module can provide LVDS only, eDP only or Dual-Mode for both interfaces. Please refer to relevant Module documentation for the supported interfaces.

Table 30: eDP Signal Definitions

Signal	Pin#	Description	I/O	Note

- 2. SOM-6868 default is not support eDP, it is option function. If customers want to use eDP function, please contact Advantech.

# 2.12. VGA \*SOM-6868 is not support VGA.

## 2.12.1. VGA Signal Definitions

The interface consists of three analog color signals (Red, Green, Blue); digital Horizontal and Vertical Sync signals as well as a dedicated I2C bus for Display Data Control (DDC) implementation for monitor capability identification. The corresponding signals can be found on the COM Express Module connector row B.

Table 32: VGA Signal Definitions

## Note:

1. SOM-6868 is not support VGA.

## 2.12.2. VGA Routing Guidelines

## 2.12.2.1. RGB Analog Signals

The RGB signal interface of the COM Express Module consists of three identical 8-bit digital-toanalog converter (DAC) channels. One each for the red, green, and blue components of the monitor signal. Each of these channels should have a  $150\Omega$  ±1% pull-down resistor connected from the DAC output to the Carrier Board ground. A second  $150\Omega$  ±1% termination resistor exists on the COM Express Module itself. An additional  $75\Omega$  termination resistor exists within the monitor for each analog DAC output signal. Since the DAC runs at speeds up to 350MHz, special attention should be paid to signal integrity and EMI. There should be a PI-filter placed on each RGB signal that is used to reduce high frequency noise and EMI. The PI-filter consists of two 10pF capacitors with a  $120\Omega$  @ 100MHz ferrite bead between them. It is recommended to place the PI-filters and the terminating resistors as close as possible to the standard VGA connector.

### 2.12.2.2. HSYNC and VSYNC Signals

The horizontal and vertical sync signals 'VGA\_HSYNC' and 'VGA\_VSYNC' provided by the COM Express Module are 3.3V tolerant outputs. Since VGA monitors may drive the monitor sync signals with 5V tolerance, it is necessary to implement high impedance unidirectional buffers. These buffers prevent potential electrical over-stress of the Module and avoid that VGA monitors may attempt to drive the monitor sync signals back to the Module. For optimal ESD protection, additional low capacitance clamp diodes should be implemented on the monitor sync signals. They should be placed between the 5V power plane and ground and as close as possible to the VGA connector.

#### 2.12.2.3. DDC Interface

COM Express provides a dedicated I2C bus for the VGA interface. It corresponds to the VESA™ defined DDC interface that is used to read out the CRT monitor specific Extended Display Identification Data (EDID™). The appropriate signals 'VGA\_I2C\_DAT' and 'VGA\_I2C\_CK' of the COM Express Module are supposed to be 3.3V tolerant. Since most VGA monitors drive the internal EDID™ EEPROM with a supply voltage of 5V, the DDC interface on the VGA connector must also be sourced with 5V. This can be accomplished by placing a 100kΩ pull-up resistors between the 5V power plane and each DDC interface line. Level shifters for the DDC interface signals are required between the COM Express Module signal side and the signals on the standard VGA connector on the Carrier Board.

Additional Schottky diodes must be placed between 5V and the pull-up resistors of the DDC signals to avoid backward current leakage during Suspend operation of the Module.

#### 2.12.2.4. ESD Protection/EMI

All VGA signals need ESD protection and EMI filters.

# 2.12.3. VGA Trace Length Guidelines

Figure 22: Topology for VGA

Table 33: VGA Trace Length Guidelines

Parameter	Main Route Guidelines	Notes
Signal Group	VGA	2
Single End	50Ω ±10%	2
Nominal Trace Space within CRT	Min. 15mils	2
DAC Signal Group		
Spacing to Other Signal Group	Min. 20mils	2
LA	Please see the SOM-6868 Layout Checklist	2
LB	Carrier Board Length	2
Max length of LA+LB	8.4"	2
Length matching	1. Match the trace lengths within R, G, B to ±200 mils.	2
	2. Match the trace lengths of CRT SYNC signals with	
	CRT DAC signals to ±1000 mils	
Reference Plane	GND referencing preferred.	2
	Min 20-mil trace edge-to-major plane edge spacing.	

- 1. Video filter must be near VGA CONN.
- 2. SOM-6868 is not support VGA.

# 2.13. Digital Audio Interfaces

The COM Express Specification allocates seven pins on the A-B connector to support digital AC'97 and HD interfaces to audio Codecs on the Carrier Board. The pins are available on all Module types. High-definition (HD) audio uses the same digital-signal interface as AC '97 audio. Codecs for AC '97 and HD Audio are different and not compatible. Current Module chipsets support HD Audio only.

## 2.13.1. Audio Codec Signal Descriptions

Table 34: Audio Codec Signal Descriptions

Signal	Pin#	Description	I/O	Note
AC/HDA_RST#	A30	CODEC Reset.	O 3.3V	
		Carrier Board:	Suspend	
		AC97 - Connect 0 $\Omega$ in series to CODEC pin 11 RESET#	CMOS	
		HDA - Connect 0 $\Omega$ in series to CODEC pin 11 RESET#		
		N/C if not used		
AC/HDA_SYNC	A29	Serial Sample Rate Synchronization.	O 3.3V	
		Carrier Board:	CMOS	
		AC97 - Connect 0 $\Omega$ in series to CODEC pin 10 SYNC		
		HDA - Connect 0 $\Omega$ in series to CODEC pin 10 SYNC		
		N/C if not used		
AC/HDA_BITCLK	A32	24 MHz Serial Bit Clock for HDA CODEC.	O 3.3V	
		Carrier Board:	CMOS	
		AC97 - Connect 33-47 $\Omega$ in series to CODEC pin 6		
		BIT_CLK		
		HDA - Module has integrated series resistor. Connect 0 $\Omega$		
		in series to CODEC pin 6 BIT_CLK		
		N/C if not used		
AC/HDA_SDOUT	A33	Audio Serial Data Output Stream.	O 3.3V	
		Carrier Board:	CMOS	
		AC97 - Connect 33-47 Ω in series to CODEC pin 8		
		SDATA_IN		
		HDA - Connect 33-47 $\Omega$ in series and PD 10K $\Omega$ (NL) to		
		CODEC pin 8 SDATA_IN		
		N/C if not used		
AC/HDA_SDIN0	B30	Audio Serial Data Input Stream from CODEC[0:2].	I 3.3V	
AC/HDA_SDIN1	B29	Carrier Board:	Suspend	
AC/HDA_SDIN2	B28	AC97 - Connect 33-47 $\Omega$ in series to CODEC pin 8	CMOS	
		SDATA_IN		
		HDA - Connect 33-47 $\Omega$ in series and PD 10K $\Omega$ (NL) to		
		CODEC pin 8 SDATA_IN		
		N/C if not used		

The codec on a COM Express Carrier Board is usually connected as the primary codec with the codec ID 00 using the data input line 'AC/HDA\_SDIN0'. Up to two additional codecs with ID 01 and ID 10 can be connected to the COM Express Module by using the other designated signals 'AC/HDA\_SDIN1' and 'AC/HDA\_SDIN2'.

Connect the primary audio codec to the serial data input signal 'AC/HDA\_SDIN0' and ensure that the corresponding bit clock input signal 'AC/HDA\_BITCLK' is connected to the AC'97/HAD interface of the COM Express Module.

Clocking over the signal 'AC/HDA\_BITCLK' is derived from a 24.576 MHz crystal or crystal oscillator provided by the primary codec in AC97 implementations. The crystal is not required in HDA implementations. This clock also drives the second and the third audio codec if more than one codec is used in the application. For crystal or crystal oscillator requirements, refer to the datasheet of the primary codec.

#### 2.13.2. Audio Routing Guidelines

The implementation of proper component placement and routing techniques will help to ensure that the maximum performance available from the codec is achieved. Routing techniques that should be observed include properly isolating the codec, associated audio circuitry, analog power supplies and analog ground planes from the rest of the Carrier Board. This includes split planes and the proper routing of signals not associated with the audio section.

The following is a list of basic recommendations:

Traces must be routed with a target impedance of  $50\Omega$  with an allowed tolerance of  $\pm 15\%$ .

Ground return paths for the analog signals must be given special consideration.

Digital signals routed in the vicinity of the analog audio signals must not cross the power plane split lines. Locate the analog and digital signals as far as possible from each other.

Partition the Carrier Board with all analog components grouped together in one area and all digital components in another.

Keep digital signal traces, especially the clock, as far as possible from the analog input and voltage reference pins.

Provide separate analog and digital ground planes with the digital components over the digital ground plane, and the analog components, including the analog power regulators, over the analog ground plane. The split between the planes must be a minimum of 0.05 inch wide.

Route analog power and signal traces over the analog ground plane.

Route digital power and signal traces over the digital ground plane.

Position the bypassing and decoupling capacitors close to the IC pins with wide traces to reduce impedance.

Place the crystal or oscillator (depending on the codec used) as close as possible to the codec.

(HDA implementations generally do not require a crystal at the codec)

Do not completely isolate the analog/audio ground plane from the rest of the Carrier Board ground plane. Provide a single point (0.25 inch to 0.5 inch wide) where the analog/isolated ground plane connects to the main ground plane. The split between the planes must be a minimum of 0.05 inch wide.

Any signals entering or leaving the analog area must cross the ground split in the area where the analog ground is attached to the main Carrier Board ground. That is, no signal should cross the split/gap between the ground planes, because this would cause a ground loop, which in turn would greatly increase EMI emissions and degrade the analog and digital signal quality.

# 2.13.3. Audio Trace Length Guidelines

Figure 23: Topology for Audio

Table 35: Audio Trace Length Guidelines

Parameter	Main Route Guidelines	Notes
Signal Group	Audio	
Single End	50Ω ±10%

Reference Plane	GND referencing preferred.	
	Min 20-mil trace edge-to-major plane edge spacing.	

## 2.14. LPC Bus - Low Pin Count Interface

Since COM Express is designed to be a legacy free standard for embedded Modules, it does not support legacy functionality on the Module, such as PS/2 keyboard/mouse, serial ports, and parallel ports. Instead, it provides an LPC interface that can be used to add peripheral devices to the Carrier Board design. COM Express also provides interface pins necessary for (optional) Carrier Board resident PS keyboard controllers.

The Low Pin Count Interface was defined by the Intel® Corporation to facilitate the industry's transition toward legacy free systems. It allows the integration of low-bandwidth legacy I/O components within the system, which are typically provided by a Super I/O controller. Furthermore, it can be used to interface Firmware Hubs, Trusted Platform Module (TPM) devices, general-purpose inputs and outputs, and Embedded Controller solutions. Data transfer on the LPC bus is implemented over a 4 bit serialized data interface, which uses a 33MHz LPC bus clock. It is straightforward to develop PLDs or FPGAs that interface to the LPC bus.

For more information about LPC bus, refer to the 'Intel® Low Pin Count Interface Specification Revision 1.1'.

## 2.14.1. LPC Signal Definition

Table 36: LPC Interface Signal Definition

Signal	Pin#	Description	I/O	Note
LPC_SERIRQ	A50	LPC serialized IRQ.	I/O 3.3V	
		Carrier Board:	CMOS	
		Connect to		
		LPC - SERIRQ		
		N/C if not use

		Carrier Board:	CMOS	
		Connect to		
		LPC - LCLK		
		FWH - Pin 31 LCLK		
		N/C if not used		

### Note

Implementing external LPC devices on the COM Express Carrier Board always requires customization of the COM Express Module's BIOS in order to support basic initialization for those LPC devices. Otherwise the functionality of the LPC devices will not be supported by a Plug&Play or ACPI capable system.

## 2.14.2. LPC Routing Guidelines

## 2.14.2.1 General Signals

LPC signals are similar to PCI signals and may be treated similarly. Route the LPC bus as 50  $\,\Omega$ , single-ended signals. The bus may be referenced to ground (preferred), or to a well-bypassed power plane or a combination of the two. Point-to-point (daisy-chain) routing is preferred, although stubs up to 1.5 inches may be acceptable. Length-matching among LPC\_AD[3:0], LPC\_FRAME# are needed

## 2.14.2.2 Bus Clock Routing

Route the LPC clock as a single-ended,  $50~\Omega$  trace with generous clearance to other traces and to itself. A continuous ground-plane reference is recommended. Routing the clock on a single ground referenced internal layer is preferred to reduce EMI.

The LPC clock implementation should follow the routing guidelines for the PCI clock defined in the COM Express specification and the 'PCI Local Bus Specification Revision 2.3'.

## 2.14.3. LPC Trace Length Guidelines

Figure 24: Topology for LPC

Table 37: LPC Trace Length Guidelines

Parameter	Main Route Guidelines	Notes
Signal Group	LPC	
Single End	50Ω ±10%	
Nominal Trace Space within LPC	Min. 15mils

Length matching between single	Max. 200mils	
ended signals		
Length matching between clock	Max. 200mils	
signals		
Reference Plane	GND referencing preferred.	
Via Usage	Try to minimize number of vias	

## 2.15. SPI - Serial Peripheral Interface Bus

The SPI interface is defined in this specification to service as an off-module option for BIOS storage. The SPI interface replaces the LPC Firmware Hub interface, which is now considered a legacy interface for firmware storage (LPC does continue to be used for Super IO connectivity).

Many current chipsets only specify SPI for BIOS/Firmware storage usage, so the COM.0 specification is limited to that connectivity use-case to enable maximum compatibility across Modules and silicon platforms. Additional features, such as SPI-based Trusted Platform Module support might be added to a given carrier design, but compatibility is not guaranteed across Modules.

## 2.15.1. SPI Signal Definition

Table 38: SPI Interface Signal Definition

		signals on page 119 below for strapping options of		
		BIOS disable signals.		
		Carrier Board:		
		1 - N/C		
		0 - PD 1K to GND		
		BIOS options are shown in Table "Effect of the BIOS		
		disable signals"		

The signals with the "SPI\_" prefix names are used to connect directly to the regarding SPI device. SPI\_CS# is the chip select signal and is usually sourced from the Module's chipset SPI0 or SPI1 signal. SPI\_MISO and SPI\_MOSI are the input and output signals and SPI\_CLK offers the clock from the Module to the carrier's device. The SPI\_POWER pin can be used to power the SPI devices and it should use less than 100mA in total. The signal is helpful to simplify the SPI schematic, because the Module's SPI power domain can be either in power state S0 or in S5.

BIOS\_DIS[0:1]# signals are used to determine the boot device according to Table X: Effect of the BIOS disable signals below. BIOS\_DISO# (formerly known as BIOS\_DISABLE# in COM.0 R1.0) is used to disable the on-module BIOS device and enable the LPC firmware hub. For SPI BIOS flash device usage the signal BIOS\_DIS1# should be activated to disable the on-module BIOS device and enable the BIOS flash chip on the carrier.

Table 39: Effect of the BIOS disable signals

BIOS_DIS1#	BIOS_DIS0#	Chipset	Chipset	Carrier	SPI	BIOS Entry	Ref
		SPI CS1#	SPI CS0#	SPI_CS#	Descriptor		Line
		Destination	Destination

## 2.16. General Purpose I2C Bus Interface

The I2C (Inter-Integrated Circuit) bus is a two-wire serial bus originally defined by Philips. The bus is used for low-speed (up to 400kbps) communication between system ICs. The bus is often used to access small serial EEPROM memories and to set up IC registers. The COM Express Specification defines several I2C interfaces that are brought to the Module connector for use on the Carrier. Some of these interfaces are for very specific functions (VGA, LVDS, and DDIX), one interface is the SMBus used primarily for management and one other interface is a general purpose I2C interface. Since COM.0 Rev. 2.0 this interface should support multi-master operation. This capability will allow a Carrier to read an optional Module EEPROM before powering up the Module.

Revision 1.0 of the specification placed the I2C interface on the non-standby power domain. With this connection, the I2C interface can only be used when the Module is powered on. Since the I2C interface is used to connect to an optional Carrier EEPROM and since it is desirable to allow a Module based board controller access to the optional Carrier EEPROM before the Module is powered on, revision 2.0 of this specification changes the power domain of the I2C interface to standby-power allowing access during power down and suspend states. There is a possible leakage issue that can arise when using a R2.0 Module with a R1.0 Carrier that supports I2C devices. The R1.0 Carrier will power any I2C devices from the non-standby power rail. A R2.0 Module will pull-up the I2C clock and data lines to the standby-rail through a 2.2K resistor. The difference in the power domains on the Module and Carrier can provide a leakage path from the standby power rail to the non-standby power rail.

Vendor interoperability is given via EAPI – Embedded Application Programming Interface, which allows and easier interoperability of COM Express Modules.

#### 2.16.1. Signal Definitions

The general purpose I2C Interface is powered from 3.3V suspend rail. The I2C\_DAT is an open collector line with a pull-up resistor located on the Module. The I2C\_CK has a pull-up resistor located on the Module. The Carrier should not contain pull-up resistors on the I2C\_DAT and I2C\_CK signals. Carrier based devices should be powered from 3.3V suspend voltage. The use of main power line for a Carrier I2C device will require a bus isolator to prevent leakage to other I2C devices on 3.3V power.

At this time, there is no allocation of I2C addresses between the Module and Carrier. Carrier designers will need to consult with Module providers for address ranges that can be used on the Carrier.

Table 41: General Purpose I2C Interface Signal Descriptions

Signal	Pin#	Description	I/O	Pwr Rail	Note

Notes:

## 2.16.4. Connectivity Considerations

The maximum amount of capacitance allowed on the Carrier General Purpose I2C bus lines (I2C\_DAT, I2C\_CK) is specified by Advantech's Module. The Carrier designer is responsible for ensuring that the maximum amount of capacitance is not exceeded and the rise/fall times of the signals meet the I2C bus specification. As a general guideline, an IC input has 8pF of capacitance, and a PCB trace has 3.8pF per inch of trace length.

## 2.17. System Management Bus (SMBus)

The SMBus is primarily used as an interface to manage peripherals such as serial presence detect (SPD) on RAM, thermal sensors, PCI/PCIe devices, smart battery, etc. The devices that can connect to the SMBus can be located on the Module and Carrier. Designers need to take note of several implementation issues to ensure reliable SMBus interface operation. The SMBus is similar to I2C. I2C devices have the potential to lock up the data line while sending information and require a power cycle to clear the fault condition. SMBus devices contain a timeout to monitor for and correct this condition. Designers are urged to use SMBus devices when possible over standard I2C devices. COM Express Modules are required to power SMBus devices from Early Power in order to have control during system states S0-S5. The devices on the Carrier Board using the SMBus are normally powered by the 3.3V main power. To avoid current leakage between the main power of the Carrier Board and the Suspend power of the Module, the SMBus on the Carrier Board must be separated by a bus switch from the SMBus of the Module. However, if the Carrier Board also uses Suspend powered SMBus devices that are designed to operate during system states S3-S5, then these devices must be connected to the Suspend powered side of the SMBus, i. e. between the COM Express Module and the bus switch. Since the SMBus is used by the Module and Carrier, care must be taken to ensure that Carrier based devices do not overlap the address space of Module based devices. Typical Module located SMBus devices and their addresses include memory SPD (serial presence detect 1010 000x, 1010 001x), programmable clock synthesizes (1101 001x), clock buffers (1101 110x), thermal sensors (1001 000x), and management controllers (vendor defined address). Contact Advantech for information on the SMBus addresses used.

		Carrier Board:	CMOS	Suspend	
		Connect to SMBALERT# of SMBus device.		Rail	
		N/C if not used.			

#### 2.17.2. SMB Routing Guidelines

The SMBus should be connected to all or none of the PCIe/PCI devices and slots. A general recommendation is to not connect these devices to the SMBus.

The maximum load of SMBus lines is limited to 3 external devices. Please contact Advantech if more devices are required.

Do not connect Non-Suspend powered devices to the SMBus unless a bus switch is used to prevent back feeding of voltage from the Suspend rail to other supplies.

Contact Advantech for a list of SMBus addresses used on the Module. Do not use the same address for Carrier located devices.

Notes:

#### 2.19. CAN Interface \*SOM-6868 is not support CAN Interface.

CAN bus is a vehicle bus standard designed to allow controllers and devices to communicate with each other without a host computer. CAN bus is a message-based protocol, designed specifically for automotive applications but now also used in other areas such as industrial automation and medical equipment.

Development of CAN bus started originally in 1983. The protocol was officially released in 1986 at the Society of Automotive Engineers (SAE) congress in Detroit, Michigan. The first CAN controller chips, produced by Intel and Philips, came on the market in 1987. In 1991 the CAN 2.0 specification was published.

Since 2008 CAN bus has been mandatory in any US vehicle in the OBD-II car diagnostic port. It is also used extensively in industrial automation.

#### 2.19.1. CAN interface Signal Definitions

		Carrier Board:		
		Check your CAN transceiver application notes.		

#### Note:

1. SOM-6868 is not support CAN Interface.

#### 2.19.2. CAN interface Routing Guidelines

It should be routed as a differential pair signal with 120 Ohm differential impedance. The end points of CAN bus should be terminated with 120 Ohms or with 60 Ohms from the CAN\_H line and 60 Ohms from the CAN\_L line to the CAN Bus reference voltage. Check your CAN transceiver application notes for further details on termination.

Table 50: Power Management Signal Definitions

Signal	Pin#	Description	I/O	Note
PWRBTN#	B12	Power button low active signal used to wake up the	I 3.3V	
		system from S5 state (soft off). This signal is triggered	Suspend	
		on the falling edge.	CMOS	
		Carrier Board:		
		ATX - Connect to Power Button or SIO Power Button		
		output pin (Active low)		
		AT - N/C		
		N/C if not used		
SYS_RESET#	B49	Reset button input. Active low request for Module to	I 3.3V	
		reset and reboot. May be falling edge sensitive. For	Suspend	
		situations when SYS_RESET# is not able to reestablish	CMOS	
		control of the system, PWR_OK or a power cycle may		
		be used.		
		Carrier Board:		
		Connect to Reset button		
		N/C if not used		
CB_RESET#	B50	Reset output signal from Module to Carrier Board.	O 3.3V	
		This signal may be driven low by the Module to reset	Suspend	
		external components located on the Carrier Board.	CMOS	
		Carrier Board:		
		Connect to reset pin of devices except PCI slots or		
		devices.		
		N/C if not used.		
PWR_OK	B24	Power OK status signal generated by the ATX power	13.3V	
		supply to notify the Module that the DC operating	CMOS	
		voltages are within the ranges required for proper		
		operation.		
		Carrier Board:		
		Connect to power good pin of main power supply ATX -		
		PW-OK pin 8 of ATX power connector connects 3.3V		
		level shifter to COME PWR_OK.		
		AT - PG pin P8.1 of AT power connector connects 3.3V		
		level shifter to COME PWR_OK.		
		Other - PWROK of 12V power generator circuit		
		connects 3.3V level shifter to COME PWR_OK.		
		N/C is not allowed, if the system is ATX mode.		
		N/C if not used.		

Signal	Pin#	Description	I/O	Note
SUS_STAT#	B18	Suspend status signal to indicate that the system will be	O 3.3V	
		entering a low power state soon. It can be used by other	Suspend	
		peripherals on the Carrier Board as an indication that they	CMOS	
		should go into power-down mode.		
		Carrier Board:		
		Connect to LPCPD# of LPC device.		
		N/C if not used.		
SUS_S3#	A15	S3 Sleep control signal indicating that the system resides	O 3.3V	
		in S3 state (Suspend to RAM).	Suspend	
		This signal can be used to control the ATX power supply	CMOS	
		via the 'PS_ON#' signal.		
		Carrier Board:		
		Connect to SLP_S3# (Suspend To RAM) of LPC device or		
		SIO.		
		N/C if not used.		
SUS_S4#	A18	S4 Sleep control signal indicating that the system resides	O 3.3V	
		in S4 state (Suspend to Disk).	Suspend	
		Carrier Board:	CMOS	
		Connect to SLP_S4# (Suspend To Disk) of LPC device or		
		SIO.		
		N/C if not used.		
SUS_S5#	A24	S5 Sleep Control signal indicating that the system resides	O 3.3V	
		in S5 State (Soft Off).	Suspend	
		Carrier Board:	CMOS	
		Connect to SLP_S5# (Soft Off) of LPC device or SIO.		
		N/C if not used.		
WAKE1#	B67	General purpose wake-up signal.	13.3V	
		Carrier Board:	Suspend	
		Connect to PME# of SIO	CMOS	
		N/C if not use		
BATLOW#	A27	Battery low input. This signal may be driven low by	I 3.3V	
		external circuitry to signal that the system battery is low. It	Suspend	
		also can be used to signal some other external power	CMOS	
		management event.		
		Carrier Board:		
		Connect to BATLOW# of Smart Battery.		
		N/C if not used.		

Note:

### 2.20.3. Thermal Interface

Table 51: Thermal Management Signal Definitions

Signal	Pin#	Description	I/O	Note
THRM#	B35	Thermal Alarm active low signal generated by the	I 3.3V	
		external hardware to indicate an over temperature	CMOS	
		situation. This signal can be used to initiate thermal		
		throttling.		
		Carrier Board:		
		Connect to THRM# output of Hardware Monitor.		
		N/C if not used.		
THRMTRIP#	A35	Thermal Trip indicates an overheating condition of the	O 3.3V	
		processor. If 'THRMTRIP#' goes active the system	CMOS	
		immediately transitions to the S5 State (Soft Off).		
		Carrier Board:		
		Connect to THERMTRIP# input of devices.		
		N/C if not used.		

Note:

### 2.20.4. Miscellaneous Signals Routing Guidelines

NA

## 2.20.5. Miscellaneous Signals Trace Length Guidelines

NA

#### 3. Power

#### 3.1. General Power requirements

COM Express calls for the Module to be powered by a single 12V power rail, with a +/-5% tolerance. The Mini format Modules are specified in COM.0 Rev. 2.1 to support a power input range of 4.75V to 20.0V. Advantech offer a wide range input even on Compact and Basic Modules. COM Express Modules may consume significant amounts of power – 25 to 50W is common, and higher levels are allowed by the standard. Close attention must be paid by the Carrier Board designer to ensure adequate power delivery. Details are given in the sections below. If Suspend functions such as Suspend-to-RAM, Suspend-to-disk, wake on power button press, wake on USB activity, etc. are to be supported, then a 5V Suspend power source must also be provided to the Module. If Suspend functions are not used, the Module VCC\_5V\_SBY pins should be left open. On some Modules, there may be a slight power efficiency advantage to connecting the Module VCC\_5V\_SBY rail to VCC\_5V rather than leaving the Module pin open.

Please contact Advantech for further details. Carrier Boards typically require other power rails such as 5V, 3.3V, 3.3V Suspend, etc. These may be derived on the Carrier Board from the 12V and 5V Suspend rails.

#### 3.2. ATX and AT Power Sequencing Diagrams

A sequence diagram for an ATX style boot from a soft-off state (S5), initiated by a power button press, is shown in Figure 30 below.

A sequence diagram for an AT style boot from the mechanical off state (G3) is shown in Figure 31 below. In both cases, the VCC\_12V, VCC\_5V and VCC\_3V3 power lines should rise together in a monotonic ramp with a positive slope only, and their rise time should be limited. Please refer to the ATX specification for more details.

Figure 31: AT Style Power Up Boot

Table 51: Power Management Timings

Sym	Description	Min	Max
T1	Power Button	16ms	
T2	The power-on time is defined as the time from when PS_ON# is pulled low		500ms
	to when the VCC_12V, VCC_5V and VCC_3V output.		
Т3	VCC_12V rise time from 10% to 95%	0.1ms	20ms
T4	PWR_OK delay	100ms	
T5	PWR_OK rise time		10ms
T6	See Note 1		
T7	Power-down warning	1ms	

#### Note:

1. There is a period of time (T6 in Figure 30 and Figure 31 above) during which the Carrier Board circuits have power but the COM Express Module main internal power rails are not up. This is because almost all COM Express internal rails are derived from the external VCC\_12V and there is a non-zero start-up time for the Module internal power supplies.

Carrier Board circuits should not drive any COM Express lines during the T6 interval except for those identified in the COM Express Specification as being powered from a Suspend power rail. Almost all such signals are active low. Such signals, if used, should be driven low by open drain Carrier Board circuits to assert them. Pull-ups, if present, should be high value (10K to 100K) and tied to VCC\_5V\_SBY.

The line PWR\_OK may be used during the T6 interval to hold off a COM Express Module boot. Sometimes this is done, for example, to allow a Carrier Board device such as an FPGA to be configured before the Module boots.

The deployment of Carrier Board pull-ups on COM Express signals should be kept to a minimum in order to avoid back-driving the COM Express signal pins during this interval.

Carrier Board pull-ups on COM Express signal pins are generally not necessary – most signals are pulled up if necessary on the Module.

#### 3.3. Design Considerations for Carrier Boards containing FPGAs/CPLDs

Very often, the Carrier Board will contain custom FPGA or other programmable devices which require the loading of program code before they are usable. The Carrier Board designer needs to take the necessary precautions to ensure that his Carrier Board logic is up and running before the Module starts. Conflicts can occur if the Module is powered on and allowed to run before devices on the Carrier Board are fully programmed and initialized. A typical example is an FPGA which includes a PCle device. Such devices must be initialized and ready before the chipset on the Module performs link training and before the BIOS code performs enumeration of PCI devices. The Module should therefore be prevented from starting before Carrier Board devices are ready.

One method to achieve this is to delay assertion of the PWR\_OK# signal to the Module until the Carrier Board initialization process has completed. Note that during the phase when the Carrier Board is powered and the Module is not powered there is potential for back drive voltages from the carrier to the Module.

Another possibility is to use the SYS\_RESET# signal to delay Module start-up. However, depending on the Module implementation and the chipset used, SYS\_RESET# may only be a falling edge triggered signal and not a low active signal as was originally intended. In that case, asserting SYS\_RESET# may not hold the Module in the reset state. Also, PCIe link training will occur regardless of the reset signal state for some chipsets.

Please refer to the COM.0 R2.1 specification (Power and System Management section) for more details and check the Module provider's documentation for their implementations of these signals.

### 4. Electrical Characteristics

## 4.1. Absolute Maximum Ratings

Table 52: Absolute Maximum Ratings

SOM-6868		MIN	MAX	UNIT
	VIN	4.75 (5-5%)	20 (19+5%)	V
Power	VSB	4.75 (5-5%)	5.25 (5+5%)	V
	RTC Battery	2.0	3.3	V

### 4.2. DC Characteristics

Table 53: DC Current Characteristics1

Intel(R) Pentium(R) CPU N3710@1.6GHz					
Power Plane	Maximum Power Consumption				
Symbol	S0	S3	S5	G3	
+VIN (+12V)	17.068W				
+VIN (+4.75V)					
+VIN (+20V)					
+V5SB_CB	0.035W	0.923W	0.747W		
RTC Battery			1.47uA	4.85uA	

### 4.3. Inrush Current

Table 55: Inrush Current

Power Plane	Maximum		
Symbol	G3 to S5	S5 to S0	
+V5SB_CB	0.72277A		
+VIN (+12V)	+	0.75721A	
+VIN (+4.75V)	+	1.05270A	
+VIN (+20V)		0.66337A
