

January 2005

The SP5655 is a single chip frequency synthesiser designed for TV tuning systems. Control data is entered in the standard I²C BUS format. The device contains 2 addressable current limited outputs and 4 addressable bidirectional open-collector ports, one of which is a 3-bit ADC. The information on these ports can be read via the I²C BUS. The device has one fixed I²C BUS address and 3 programmable addresses, programmed by applying a specific input voltage to one of the current limited outputs. This enables two or more synthesisers to be used in a system.

FEATURES

- Complete 2.7GHz Single Chip System
- High Sensitivity RF Inputs
- Programmable via I²C BUS
- Low Power Consumption (5V, 30mA)
- Low Radiation
- Phase Lock Detector
- Varactor Drive Amp Disable
- 6 Controllable Outputs, 4 Bidirectional
- 5-Level ADC
- Variable I²C BUS Address for Multi-tuner Applications
- ESD Protection: 4kV, Mil-Std-883C, Method 3015 ⁽¹⁾
- Switchable 4512/1024 Reference Divider
- Pin and Function Compatible with SP5055S ⁽²⁾

(1) Normal ESD handling precautions should be observed.

(2) The SP5055S does not have a switchable reference division ratio.

FUNCTIONAL DESCRIPTION

The SP5655 is programmed from an I²C Bus. Data and Clock are fed in on the SDA and SCL lines respectively, as defined by the I²C Bus format. The synthesiser can either accept new data (write mode) or send data (read mode). The LSB of the address byte (R/W) sets the device into write mode if it is low and read mode if it is high. The Tables in Fig. 3 illustrate the format of the data. The device can be programmed to respond to several addresses, which enables the use of more than one synthesiser in an I²C Bus system. Table 4 shows how the address is selected by applying a voltage to P3.

When the device receives a correct address byte, it pulls the SDA line low during the acknowledge period, and during following acknowledge periods after further data bytes are programmed. When the device is programmed into the read mode, the controller accepting the data must pull the SDA line low during all status byte acknowledge periods to read another status byte. If the controller fails to pull the SDA line low during this period, the device generates an internal STOP condition, which inhibits further reading.

WRITE Mode (Frequency Synthesis)

When the device is in write mode bytes 2 and 3 select the synthesised frequency, while bytes 4 and 5 control the output port states, charge pump, reference divider ratio and various test modes.

Once the correct address is received and acknowledged, the first bit of the next byte determines whether that byte is interpreted as byte 2 or 4; a logic 0 for frequency information and a logic 1 for control and output port information. When byte 2 is received the device always expects byte 3 next. Similarly, when byte 4 is received the device expects byte 5 next. Additional data bytes can be entered without the need to readdress the device until an I²C stop condition is recognised. This allows a smooth frequency sweep for fine tuning or AFC purposes.

If the transmission of data is stopped mid-byte (for example, by another device on the bus) then the previously programmed byte is maintained.

Frequency data from bytes 2 and 3 are stored in a 15-bit register and used to control the division ratio of the 15-bit programmable divider. This is preceded by a divide-by-16 prescaler and amplifier to give excellent sensitivity at the local oscillator input, see Fig. 5. The input impedance is shown in Fig. 7.

The programmed frequency can be calculated by multiplying the programmed division ratio by 16 times the comparison frequency F_{COMP} . When frequency data is entered, the phase comparator, via a charge pump and varicap drive amplifier, adjusts the local oscillator control voltage until the output of the programmable divider is frequency and phased locked to the comparison frequency.

The reference frequency may be generated by an external source capacitively coupled into pin 2, or provided by an on-chip crystal controlled oscillator. The comparison frequency F_{COMP} is derived from the reference frequency via the reference divider. The reference divider division ratio is switchable

from 512 to 1024, and is controlled by bit 7 of byte 4 (TS0); a logic 1 to 512, a logic 0 for 1024. The SP5655 differs from the SP5055 in this respect, only 512 being available on the SP5055. Note that the comparison frequency is 7.8125kHz when a 4MHz reference is used, and divide by 512 is selected.

Bit 2 of byte 4 of the programming data (CP) controls the current in the charge pump circuit, a logic 1 for $\pm 170\mu A$ and a logic 0 for $\pm 50\mu A$, allowing compensation for the variable tuning slope of the tuner and also to enable fast channel changes over the full band. When the device is frequency locked, the charge pump current is internally set to $\pm 50\mu A$ regardless of CP.

Bit 4 of byte 4 (T0) disables the charge pump when it is set to a logic 1.

Bit 8 of byte 4 (OS) switches the charge pump drive amplifier's output off when it is set to a logic 1.

Bit 3 of byte 4 (T1) enables various test modes when set high. These modes are selected by bits 5, 6 and 7 of byte 4 (TS2, and TS1, TS0) as detailed in Table 5. When T1 is set low, TS2 and TS1 are assigned a 'don't care' condition, and TS0 selects the reference divider ratio as previously described.

Byte 5 programs the output ports P0 and P3 to P7; a logic 0 for a high impedance output and a logic 1 for low impedance (on).

READ Mode

When the device is in read mode the status byte read from the device on the SDA line takes the form shown in Table 2.

Bit 1 (POR) is the power-on reset indicator and is set to a logic 1 if the V_{CC} supply to the device has dropped below 3V (at 25°C), for example, when the device is initially turned on. The POR is reset to 0 when the read sequence is terminated by a stop command. When POR is set high (at low V_{CC}), the programmed information is lost and the output ports are all set to high impedance.

Bit 2 (FL) indicates whether the device is phase locked, a logic 1 is present if the device is locked, and a logic 0 if the device is unlocked.

Bits 3, 4 and 5 (I2, I1, I0) show the status of the I/O Ports P7, P5 and P4 respectively. A logic 0 indicates a low level and a logic 1 a high level. If the ports are to be used as inputs they should be programmed to a high impedance state (logic 1). These inputs will then respond to data complying with TTL type voltage levels.

Bits 6, 7 and 8 (A2, A1, A0) combine to give the output of the 5-level ADC. The ADC can be used to feed AFC information to the microprocessor from the IF section of the receiver, as illustrated in the typical application circuit.

APPLICATION

A typical application is shown in Fig. 4. All input/output interface circuits are shown in Fig. 6. The SP5655 is function and pin equivalent to the SP5055 device apart from the switchable reference divider, and has much lower power dissipation, improved RF sensitivity and better ESD performance.

	MSB					LSB				
Address	1	1	0	0	0	MA1	MA0	0	A	Byte 1
Programmable divider	0	2 ¹⁴	2 ¹³	2 ¹²	2 ¹¹	2 ¹⁰	2 ⁹	2 ⁸	A	Byte 2

APPLICATION NOTES

An application note, AN168, is available for designing with synthesisers such as the SP5655. It covers aspects such as loop filter design, decoupling and I²C bus radiation problems.

The application note is published in the Zarlink Semiconductor Media IC Handbook. A generic test/demonstration board has been produced, which can be used for the SP5655. A circuit diagram and layout for the board are shown in Figs. 8 and 9.

The board can be used for the following purposes:

- (A) Measuring RF sensitivity performance
- (B) Indicating port function
- (C) Synthesising a voltage controlled oscillator
- (D) Testing external reference sources

The programming codes relevant to these tests are given in Table 6.

Fig. 8 Test board circuit

Top view (ground plane)

NOTES

1. CIRCUIT SCHEMATIC IS SHOWN IN FIG. 8
2. ALL SURFACE MOUNT COMPONENTS ARE MOUNTED ON UNDERSIDE OF BOARD

Fig. 9 Test board layout

TEST MODES

As explained in the functional description, The SP5655 can be programmed into a number of test modes. These are invoked by programming Hex codes into byte 4, those most commonly used being shown in Table 6.

Other codes will also apply due to don't care conditions, which are assumed to be 1 in the Table.

NOTE:

When looking at F_{PD} or F_{COMP} signals from ports P7 and P6, byte should be sent twice, first to set the desired reference division ratio then to switch on the chosen test mode.

The pulses can then be measured by simply connecting an oscilloscope or counter to the relevant output pin on the test board.

Operation mode description	Hex code (byte 4)	
	CP high mode	CP low mode
Normal operation, reference divider ratio = 1024	CC	8C
Normal operation, reference divider ratio = 512	CE	8E
Charge pump source (down), FL set to 0	E2	A2
Charge pump sink (up), FL set to 1	E6	A6
Port P7 = $F_{PD}/2$	EA	AA
Port P7 = F_{PD} , P6 = F_{COMP}	EE	AE
Charge pump disable, reference divider ratio = 512	DE	9E
Varactor line disable, reference divider ratio = 512	CF	8F
Charge pump and varactor line disable, reference divider ratio = 512	DF	9F

N	16		16	
Conforms to JEDEC MS-012AC Iss. C				

Notes:

1. The chamfer on the body is optional. If not present, a visual index feature, e.g. a dot, must be located within the cross-hatched area.
2. Controlling dimensions are in inches.
3. Dimension D do not include mould flash, protusion or gate burrs. These shall not exceed 0.006" per side.
4. Dimension E1 do not include inter-lead flash or protusion. These shall not exceed 0.010" per side.
5. Dimension b does not include dambar protusion / intrusion. Allowable dambar protusion shall be 0.004" total in excess of b dimension.
