# MPC5744P Reference Manual

Supports MPC5744P, MPC5743P, MPC5742P and MPC5741P

Document Number: MPC5744PRM  
Rev. 6, 06/2016

## Contents

|----------------|-------|------|

### Chapter 1 Preface

|       |                                 |    |
|-------|---------------------------------|----|
| 1.1   | Overview.....                   | 79 |
| 1.2   | Device versions.....            | 79 |
| 1.3   | Audience.....                   | 79 |
| 1.4   | Document organization.....      | 80 |
| 1.5   | Conventions.....                | 80 |
| 1.5.1 | Numbering systems.....          | 80 |
| 1.5.2 | Typographic notation.....       | 80 |
| 1.5.3 | Special terms.....              | 81 |
| 1.6   | Acronyms and abbreviations..... | 81 |
| 1.7   | References.....                 | 82 |

### Chapter 2 Introduction

|       |                                     |    |
|-------|-------------------------------------|----|
| 2.1   | Overview.....                       | 83 |
| 2.1.1 | Overall architecture.....           | 83 |
| 2.1.2 | Core features.....                  | 83 |
| 2.1.3 | Memory hierarchy.....               | 84 |
| 2.1.4 | Off-chip communication.....         | 85 |
| 2.1.5 | I/O control.....                    | 85 |
| 2.1.6 | Peripheral set compatibility.....   | 85 |
| 2.1.7 | Technology.....                     | 85 |
| 2.2   | Target applications.....            | 85 |
| 2.3   | Features.....                       | 86 |
| 2.3.1 | Software debug and calibration..... | 88 |
| 2.3.2 | Compatibility with MPC5643L.....    | 88 |
| 2.3.3 | Block Diagram.....                  | 89 |

### Chapter 3

| Section number           | Title                                          | Page |
|--------------------------|------------------------------------------------|------|
| <b>Embedded Memories</b> |                                                |      |
| 3.1                      | Overview.....                                  | 91   |
| 3.2                      | SRAM.....                                      | 91   |
| 3.2.1                    | System SRAM.....                               | 91   |
| 3.2.2                    | Processor core local SRAM.....                 | 92   |
| 3.3                      | Flash memory.....                              | 92   |
| 3.3.1                    | Flash memory controller.....                   | 93   |
| 3.3.2                    | Flash memory array.....                        | 93   |
| 3.4                      | End-to-end Error Correction Code (e2eECC)..... | 94   |

## Chapter 4 Signal Description

|       |                                                            |     |
|-------|------------------------------------------------------------|-----|
| 4.1   | Production packages.....                                   | 97  |
| 4.2   | Package pinouts and ballmap.....                           | 98  |
| 4.3   | Pin/ball descriptions .....                                | 101 |
| 4.3.1 | Pin/ball startup and reset states.....                     | 101 |
| 4.3.2 | Power supply and reference voltage pins/balls.....         | 102 |
| 4.3.3 | System pins/balls.....                                     | 105 |
| 4.3.4 | LVDS pins/balls.....                                       | 106 |
| 4.3.5 | Generic pins/balls.....                                    | 107 |
| 4.3.6 | Peripheral input muxing.....                               | 136 |
| 4.3.7 | Pins with analog functions.....                            | 147 |
| 4.3.8 | Mapping of ports to PGPDO registers.....                   | 149 |
| 4.3.9 | Address map and configuration for MSCR/IMCR registers..... | 149 |

## Chapter 5 Memory Map

|       |                                       |     |
|-------|---------------------------------------|-----|
| 5.1   | Memory Map.....                       | 159 |
| 5.1.1 | Power control registers.....          | 165 |
| 5.1.2 | Clock generation registers.....       | 165 |
| 5.1.3 | Flash memory and RAM memory maps..... | 166 |

## Chapter 6

| Section number | Title                                                         | Page |
|----------------|---------------------------------------------------------------|------|
|                | <b>Functional Safety</b>                                      |      |
| 6.1            | Introduction.....                                             | 171  |
|                | <b>Chapter 7</b>                                              |      |
|                | <b>Chip Configuration</b>                                     |      |
| 7.1            | Introduction.....                                             | 173  |
| 7.2            | Core modules.....                                             | 173  |
| 7.2.1          | Core reset settings.....                                      | 173  |
| 7.2.2          | Special Purpose Register summary.....                         | 175  |
| 7.2.3          | Core reservation instructions.....                            | 178  |
| 7.3            | Platform Configuration Module (PCM).....                      | 178  |
| 7.3.1          | Bus Bridge Configuration Register 1 (PCM_IAHB_BE1).....       | 179  |
| 7.3.2          | Bus Bridge Configuration Register 2 (PCM_IAHB_BE2).....       | 180  |
| 7.3.3          | Bus Bridge Configuration Register 3 (PCM_IAHB_BE3).....       | 181  |
| 7.4            | System modules.....                                           | 182  |
| 7.4.1          | System Integration Unit Lite2 (SIUL2) configuration.....      | 182  |
| 7.4.2          | Crossbar Switch Integrity Checker (XBIC) configuration.....   | 183  |
| 7.4.3          | Crossbar Switch (XBAR) configuration .....                    | 185  |
| 7.4.4          | System Memory Protection Unit (SMPU) configuration.....       | 188  |
| 7.4.5          | Peripheral Bridge configuration.....                          | 189  |
| 7.4.6          | Interrupt Controller (INTC) configuration.....                | 192  |
| 7.4.7          | DMA Controller configuration.....                             | 203  |
| 7.4.8          | DMAMUX configuration .....                                    | 204  |
| 7.4.9          | Error Injection Module (EIM) configuration.....               | 206  |
| 7.5            | Clocking .....                                                | 207  |
| 7.6            | Memories and memory interfaces.....                           | 207  |
| 7.6.1          | RAM controller (PRAMC) configuration.....                     | 207  |
| 7.6.2          | Flash Memory Controller (PFLASH) configuration .....          | 208  |
| 7.6.3          | Embedded Flash Memory (c55fmc) configuration.....             | 208  |
| 7.6.4          | Decorated Storage Memory Controller (DSMC) configuration..... | 218  |

| Section number | Title                                                                     | Page |
|----------------|---------------------------------------------------------------------------|------|
| 7.7            | Motor control configurations.....                                         | 219  |
| 7.8            | Motor control modules.....                                                | 219  |
| 7.8.1          | Temperature sensor configuration .....                                    | 220  |
| 7.8.2          | Analog to Digital Converter (ADC) configuration.....                      | 220  |
| 7.8.3          | Sine Wave Generator (SGEN) configuration.....                             | 220  |
| 7.8.4          | Enhanced Motor Control Timer (eTimer) configuration .....                 | 220  |
| 7.8.5          | Motor Control Pulse Width Modulator (FlexPWM) configuration.....          | 221  |
| 7.8.6          | Cross-Triggering Unit (CTU) configuration .....                           | 221  |
| 7.9            | Timers.....                                                               | 224  |
| 7.9.1          | System Timer Module (STM) configuration.....                              | 225  |
| 7.9.2          | Software Watchdog Timer (SWT) configuration .....                         | 225  |
| 7.9.3          | Periodic Interrupt Timer (PIT) configuration .....                        | 226  |
| 7.10           | Communication interfaces.....                                             | 226  |
| 7.10.1         | FlexCAN configuration .....                                               | 226  |
| 7.10.2         | LVDS Fast Asynchronous Transmission (LFAST) interface configuration ..... | 226  |
| 7.10.3         | Serial Peripheral Interface (SPI) configuration .....                     | 227  |
| 7.10.4         | FlexRay configuration .....                                               | 227  |
| 7.10.5         | SENT receiver (SRX) configuration .....                                   | 229  |
| 7.10.6         | LINFlexD configuration .....                                              | 229  |
| 7.10.7         | Ethernet (ENET) configuration.....                                        | 229  |
| 7.11           | Reset and boot modules.....                                               | 230  |
| 7.11.1         | System Status and Configuration Module (SSCM) configuration.....          | 230  |
| 7.12           | Safety modules.....                                                       | 232  |
| 7.12.1         | CRC configuration .....                                                   | 232  |
| 7.12.2         | Memory Error Management Unit (MEMU) configuration.....                    | 232  |
| 7.12.3         | Fault Collection and Control Unit (FCCU) configuration.....               | 235  |
| 7.12.4         | Self-Test Control Unit (STCU2) configuration.....                         | 243  |
| 7.12.5         | Register protection (REG_PROT) configuration .....                        | 244  |
| 7.13           | Debug.....                                                                | 244  |

| Section number | Title                                         | Page |
|----------------|-----------------------------------------------|------|
| 7.14           | Wakeup Unit (WKPU) configuration.....         | 244  |
| 7.14.1         | Chip-specific WKPU register reset values..... | 244  |

## Chapter 8 Reset

|       |                                         |     |
|-------|-----------------------------------------|-----|
| 8.1   | Introduction.....                       | 247 |
| 8.1.1 | Global Reset.....                       | 247 |
| 8.1.2 | Local Reset.....                        | 247 |
| 8.2   | Global Reset Process.....               | 247 |
| 8.2.1 | Overview.....                           | 247 |
| 8.2.2 | Reset Process Modules.....              | 248 |
| 8.2.3 | Reset Process Sequence.....             | 250 |
| 8.2.4 | Reset Process State Transitions.....    | 251 |
| 8.2.5 | Module Status During Reset Process..... | 260 |

## Chapter 9 Device Configuration Format (DCF) Records

|       |                                            |     |
|-------|--------------------------------------------|-----|
| 9.1   | Introduction.....                          | 263 |
| 9.2   | DCF clients.....                           | 263 |
| 9.2.1 | Safety features of DCF clients.....        | 263 |
| 9.2.2 | DCF client modification rules.....         | 264 |
| 9.3   | DCF records.....                           | 265 |
| 9.4   | DCF clients available in the SOC.....      | 266 |
| 9.4.1 | Security and serial boot mode records..... | 267 |
| 9.4.2 | OTP records.....                           | 267 |
| 9.4.3 | FCCU record.....                           | 267 |
| 9.4.4 | SOC configuration record.....              | 268 |
| 9.4.5 | STCU configuration records.....            | 269 |

## Chapter 10 Device Security

|      |                      |     |
|------|----------------------|-----|
| 10.1 | Device Security..... | 271 |
|------|----------------------|-----|

| Section number    | Title                                                 | Page |
|-------------------|-------------------------------------------------------|------|
| <b>Chapter 11</b> |                                                       |      |
| <b>Debug</b>      |                                                       |      |
| 11.1              | Introduction.....                                     | 273  |
| 11.2              | e200z4 core debug support.....                        | 273  |
| 11.3              | Core lockstep and RCCU disablement in debug mode..... | 274  |
| 11.4              | Run control and memory access.....                    | 274  |
| 11.5              | JTAG Controller (JTAGC) .....                         | 275  |
| 11.5.1            | JTAGC ACCESS_AUX block instructions.....              | 275  |
| 11.5.2            | TEST_CTRL register.....                               | 276  |
| 11.5.3            | Device identification register reset values.....      | 277  |
| 11.6              | Nexus Port Controller (NPC).....                      | 277  |
| 11.6.1            | Chip-specific NPC information.....                    | 277  |
| 11.6.2            | Block diagram.....                                    | 279  |
| 11.6.3            | External signal description.....                      | 282  |

## Chapter 12 Power Management

|         |                                          |     |
|---------|------------------------------------------|-----|
| 12.1    | Overview.....                            | 325 |
| 12.1.1  | Power Control Unit (PCU).....            | 326 |
| 12.1.2  | Power Management Controller (PMC).....   | 326 |
| 12.1.3  | Supply Concept.....                      | 326 |
| 12.1.4  | Power Modes.....                         | 327 |
| 12.1.5  | External Supply.....                     | 327 |
| 12.1.6  | Power Management Supply Description..... | 328 |
| 12.1.7  | Voltage Monitoring.....                  | 328 |
| 12.1.8  | Power-on Reset.....                      | 331 |
| 12.1.9  | Power-up Sequence.....                   | 332 |
| 12.1.10 | ADC Interface.....                       | 334 |
| 12.1.11 | Safety Measures.....                     | 334 |

## Chapter 13 Clocking

|        |                                         |     |
|--------|-----------------------------------------|-----|
| 13.1   | Introduction.....                       | 335 |
| 13.2   | Clock generation.....                   | 336 |
| 13.2.1 | MC_CGM registers.....                   | 338 |
| 13.3   | System clock frequency limitations..... | 339 |
| 13.3.1 | JTAG Frequencies.....                   | 340 |
| 13.4   | Default clock configuration.....        | 340 |

| Section number | Title                                        | Page |
|----------------|----------------------------------------------|------|
| 13.5           | Clock sources.....                           | 340  |
| 13.5.1         | PLL.....                                     | 341  |
| 13.5.2         | External oscillator (XOSC).....              | 345  |
| 13.5.3         | 16 MHz internal RC oscillator (IRCOSC).....  | 345  |
| 13.6           | Peripheral clocks.....                       | 346  |
| 13.6.1         | LFAST clocking.....                          | 348  |
| 13.6.2         | FlexRay clocking.....                        | 348  |
| 13.6.3         | FlexCAN clocking.....                        | 349  |
| 13.7           | Clock monitoring.....                        | 349  |
| 13.7.1         | CMU configuration.....                       | 349  |
| 13.7.2         | External oscillator (XOSC) monitor.....      | 351  |
| 13.7.3         | Internal RC oscillator (IRCOSC) monitor..... | 352  |
| 13.7.4         | System clock monitors.....                   | 352  |
| 13.8           | Loss of clock sources behavior.....          | 352  |
| 13.8.1         | Loss of PLL/XOSC clock.....                  | 352  |
| 13.8.2         | Loss of IRCOSC clock.....                    | 353  |
| 13.8.3         | PLL loss of lock interrupt.....              | 353  |

## Chapter 14 e200z4d Core Complex Overview

|        |                                                      |     |
|--------|------------------------------------------------------|-----|
| 14.1   | Introduction .....                                   | 355 |
| 14.2   | Overview of e200z4251n3 and e200z424 cores.....      | 355 |
| 14.3   | Features.....                                        | 356 |
| 14.4   | Microarchitecture summary.....                       | 357 |
| 14.4.1 | Instruction unit features.....                       | 359 |
| 14.4.2 | Integer unit features.....                           | 360 |
| 14.4.3 | Load/Store unit features.....                        | 360 |
| 14.4.4 | EFPU2 Floating-Point Unit features.....              | 360 |
| 14.4.5 | LSP Lightweight Signal Processing Unit features..... | 361 |
| 14.4.6 | MPU features.....                                    | 361 |

| Section number | Title                                  | Page |
|----------------|----------------------------------------|------|
| 14.4.7         | Cache features.....                    | 362  |
| 14.4.8         | Local memory features.....             | 362  |
| 14.4.9         | Performance Monitor Unit features..... | 362  |
| 14.4.10        | e200z4251n3 system bus features.....   | 363  |
| 14.4.11        | e200z424 system features.....          | 363  |

## Chapter 15 Core Detailed Description

|         |                                                                                                |     |
|---------|------------------------------------------------------------------------------------------------|-----|
| 15.1    | Overview of the e200z4251n3 core.....                                                          | 365 |
| 15.2    | Register model.....                                                                            | 366 |
| 15.2.1  | Branch Unit Control and Status Register (BUCSR).....                                           | 369 |
| 15.3    | Dual-issue operation.....                                                                      | 371 |
| 15.4    | Instruction timing.....                                                                        | 372 |
| 15.5    | Reservation instructions and cache interactions.....                                           | 383 |
| 15.6    | Signal Processing Extension/Embedded Floating-point Status and Control Register (SPEFSCR)..... | 384 |
| 15.7    | Cache.....                                                                                     | 386 |
| 15.7.1  | Cache overview.....                                                                            | 386 |
| 15.7.2  | L1 Cache Control and Status Register 0 (L1CSR0).....                                           | 387 |
| 15.7.3  | L1 Cache Control and Status Register 1 (L1CSR1).....                                           | 390 |
| 15.7.4  | L1 Cache Configuration Register 0 (L1CFG0).....                                                | 392 |
| 15.7.5  | L1 Cache Configuration Register 1 (L1CFG1).....                                                | 393 |
| 15.7.6  | Data Cache Software Coherency.....                                                             | 394 |
| 15.7.7  | Data Cache Hardware Coherency.....                                                             | 394 |
| 15.7.8  | Cache Invalidate by Set and Way.....                                                           | 394 |
| 15.7.9  | Cache EDC/ECC Parity Protection.....                                                           | 396 |
| 15.7.10 | Cache Error Injection.....                                                                     | 398 |
| 15.8    | Exceptions.....                                                                                | 399 |
| 15.8.1  | Exception Syndrome Register (ESR).....                                                         | 400 |
| 15.8.2  | Machine State Register (MSR).....                                                              | 401 |
| 15.8.3  | Machine Check Syndrome Register (MCSR).....                                                    | 403 |

| Section number | Title                                              | Page |
|----------------|----------------------------------------------------|------|
| 15.8.4         | Interrupt Vector Prefix Registers (IVPR).....      | 406  |
| 15.8.5         | Interrupt Definitions.....                         | 407  |
| 15.9           | Memory Protection Unit (MPU).....                  | 417  |
| 15.9.1         | MPU Overview.....                                  | 417  |
| 15.9.2         | Software Interface and MPU Instructions.....       | 417  |
| 15.9.3         | MPU Read Entry Instruction (mpure).....            | 418  |
| 15.9.4         | MPU Write Entry Instruction (mpuwe).....           | 418  |
| 15.9.5         | MPU Synchronize Instruction (mpusync).....         | 419  |
| 15.9.6         | MMU/MPU Configuration Register (MMUCFG).....       | 419  |
| 15.9.7         | MPU0 Configuration Register (MPU0CFG).....         | 420  |
| 15.9.8         | MPU0 Control and Status Register 0 (MPU0CSR0)..... | 421  |
| 15.9.9         | MPU Assist Registers (MAS).....                    | 424  |
| 15.9.10        | MAS Registers Summary.....                         | 429  |
| 15.10          | Local memories.....                                | 429  |
| 15.10.1        | Local Data memory overview.....                    | 429  |
| 15.10.2        | Local memory control and configuration.....        | 430  |
| 15.11          | End-to-End ECC Support.....                        | 439  |
| 15.11.1        | End-to-End ECC control and configuration.....      | 439  |

## Chapter 16

### System Integration Unit Lite2 (SIUL2)

|        |                                                                  |     |
|--------|------------------------------------------------------------------|-----|
| 16.1   | Introduction.....                                                | 445 |
| 16.1.1 | Overview.....                                                    | 445 |
| 16.1.2 | Features.....                                                    | 447 |
| 16.1.3 | Register protection.....                                         | 448 |
| 16.2   | Memory map and register description.....                         | 448 |
| 16.2.1 | SIUL2 MCU ID Register #1 (SIUL2_MIDR1).....                      | 471 |
| 16.2.2 | SIUL2 MCU ID Register #2 (SIUL2_MIDR2).....                      | 472 |
| 16.2.3 | SIUL2 DMA/Interrupt Status Flag Register0 (SIUL2_DISR0).....     | 473 |
| 16.2.4 | SIUL2 DMA/Interrupt Request Enable Register0 (SIUL2_DIRER0)..... | 478 |

| Section number | Title                                                                    | Page |
|----------------|--------------------------------------------------------------------------|------|
| 16.2.5         | SIUL2 DMA/Interrupt Request Select Register0 (SIUL2_DIRSR0).....         | 482  |
| 16.2.6         | SIUL2 Interrupt Rising-Edge Event Enable Register 0 (SIUL2_IREER0).....  | 486  |
| 16.2.7         | SIUL2 Interrupt Falling-Edge Event Enable Register 0 (SIUL2_IFEER0)..... | 489  |
| 16.2.8         | SIUL2 Interrupt Filter Enable Register 0 (SIUL2_IFER0).....              | 492  |
| 16.2.9         | SIUL2 Interrupt Filter Maximum Counter Register (SIUL2_IFMCRn).....      | 495  |
| 16.2.10        | SIUL2 Interrupt Filter Clock Prescaler Register (SIUL2_IFCPR).....       | 496  |
| 16.2.11        | SIUL2 Multiplexed Signal Configuration Register (SIUL2_MSCRn).....       | 497  |
| 16.2.12        | SIUL2 Input Multiplexed Signal Configuration Register (SIUL2_IMCRn)..... | 500  |
| 16.2.13        | SIUL2 GPIO Pad Data Output Register (SIUL2_GPDOn).....                   | 501  |
| 16.2.14        | SIUL2 GPIO Pad Data Input Register (SIUL2_GPDIn).....                    | 502  |
| 16.2.15        | SIUL2 Parallel GPIO Pad Data Out Register (SIUL2_PGPDOn).....            | 504  |

| 21.6           | Functional description.....                                        | 612  |
| 21.6.1         | Interrupt request sources.....                                     | 612  |
| 21.6.2         | Priority management.....                                           | 613  |
| 21.6.3         | Handshaking with processor.....                                    | 615  |
| 21.6.4         | Interrupt Controller Monitor (INTCM).....                          | 618  |
| 21.7           | Initialization/application information.....                        | 619  |
| 21.7.1         | Initialization flow.....                                           | 619  |
| 21.7.2         | Interrupt exception handler.....                                   | 620  |
| 21.7.3         | ISR, RTOS, and task hierarchy.....                                 | 621  |
| 21.7.4         | Order of execution.....                                            | 622  |
| 21.7.5         | Priority ceiling protocol.....                                     | 623  |
| 21.7.6         | Selecting priorities according to request rates and deadlines..... | 626  |
| 21.7.7         | Software-settable interrupt requests.....                          | 627  |
| 21.7.8         | Lowering priority within an ISR.....                               | 628  |
| 21.7.9         | Negating an interrupt request outside of its ISR.....              | 629  |
| 21.7.10        | Examining LIFO contents.....                                       | 629  |
| 21.8           | Interrupt sources.....                                             | 630  |

## Chapter 22 Enhanced Direct Memory Access (eDMA)

|        |                                     |     |
|--------|-------------------------------------|-----|
| 22.1   | Introduction.....                   | 631 |
| 22.1.1 | eDMA system block diagram.....      | 631 |
| 22.1.2 | Block parts.....                    | 632 |
| 22.1.3 | Features.....                       | 633 |
| 22.2   | Modes of operation.....             | 634 |
| 22.3   | Memory map/register definition..... | 635 |

| Section number | Title                                                                                                           | Page |
|----------------|-----------------------------------------------------------------------------------------------------------------|------|
| 22.3.1         | TCD memory.....                                                                                                 | 635  |
| 22.3.2         | TCD initialization.....                                                                                         | 635  |
| 22.3.3         | TCD structure.....                                                                                              | 635  |
| 22.3.4         | Reserved memory and bit fields.....                                                                             | 636  |
| 22.3.1         | Control Register (DMA_CR).....                                                                                  | 663  |
| 22.3.2         | Error Status Register (DMA_ES).....                                                                             | 666  |
| 22.3.3         | Enable Request Register (DMA_ERQ).....                                                                          | 669  |
| 22.3.4         | Enable Error Interrupt Register (DMA_EEI).....                                                                  | 672  |
| 22.3.5         | Set Enable Request Register (DMA_SERQ).....                                                                     | 676  |
| 22.3.6         | Clear Enable Request Register (DMA_CERQ).....                                                                   | 677  |
| 22.3.7         | Set Enable Error Interrupt Register (DMA_SEEI).....                                                             | 678  |
| 22.3.8         | Clear Enable Error Interrupt Register (DMA_CEEI).....                                                           | 679  |
| 22.3.9         | Clear Interrupt Request Register (DMA_CINT).....                                                                | 680  |
| 22.3.10        | Clear Error Register (DMA_CERR).....                                                                            | 681  |
| 22.3.11        | Set START Bit Register (DMA_SSRT).....                                                                          | 682  |
| 22.3.12        | Clear DONE Status Bit Register (DMA_CDNE).....                                                                  | 683  |
| 22.3.13        | Interrupt Request Register (DMA_INT).....                                                                       | 684  |
| 22.3.14        | Error Register (DMA_ERR).....                                                                                   | 687  |
| 22.3.15        | Hardware Request Status Register (DMA_HRS).....                                                                 | 691  |
| 22.3.16        | Channel n Priority Register (DMA_DCHPRIn).....                                                                  | 697  |
| 22.3.17        | Channel n Master ID Register (DMA_DCHMIDn).....                                                                 | 698  |
| 22.3.18        | TCD Source Address (DMA_TCDn_SADDR).....                                                                        | 699  |
| 22.3.19        | TCD Transfer Attributes (DMA_TCDn_ATTR).....                                                                    | 699  |
| 22.3.20        | TCD Signed Source Address Offset (DMA_TCDn_SOFF).....                                                           | 700  |
| 22.3.21        | TCD Minor Byte Count (Minor Loop Mapping Disabled) (DMA_TCDn_NBYTES_MLNO).....                                  | 701  |
| 22.3.22        | TCD Signed Minor Loop Offset (Minor Loop Mapping Enabled and Offset Disabled)<br>(DMA_TCDn_NBYTES_MLOFFNO)..... | 701  |
| 22.3.23        | TCD Signed Minor Loop Offset (Minor Loop Mapping and Offset Enabled)<br>(DMA_TCDn_NBYTES_MLOFFYES).....         | 703  |

| Section number | Title                                                                                                       | Page |
|----------------|-------------------------------------------------------------------------------------------------------------|------|
| 22.3.24        | TCD Last Source Address Adjustment (DMA_TCDn_SLAST).....                                                    | 704  |
| 22.3.25        | TCD Destination Address (DMA_TCDn_DADDR).....                                                               | 704  |
| 22.3.26        | TCD Current Minor Loop Link, Major Loop Count (Channel Linking Enabled)<br>(DMA_TCDn_CITER_ELINKYES).....   | 705  |
| 22.3.27        | TCD Current Minor Loop Link, Major Loop Count (Channel Linking Disabled)<br>(DMA_TCDn_CITER_ELINKNO).....   | 706  |
| 22.3.28        | TCD Signed Destination Address Offset (DMA_TCDn_DOFF).....                                                  | 707  |
| 22.3.29        | TCD Last Destination Address Adjustment/Scatter Gather Address (DMA_TCDn_DLASTSGA).....                     | 707  |
| 22.3.30        | TCD Beginning Minor Loop Link, Major Loop Count (Channel Linking Enabled)<br>(DMA_TCDn_BITER_ELINKYES)..... | 708  |
| 22.3.31        | TCD Beginning Minor Loop Link, Major Loop Count (Channel Linking Disabled)<br>(DMA_TCDn_BITER_ELINKNO)..... | 709  |
| 22.3.32        | TCD Control and Status (DMA_TCDn_CSR).....                                                                  | 710  |
| 22.4           | Functional description.....                                                                                 | 712  |
| 22.4.1         | eDMA basic data flow.....                                                                                   | 712  |
| 22.4.2         | Fault reporting and handling.....                                                                           | 715  |
| 22.4.3         | Channel preemption.....                                                                                     | 718  |
| 22.4.4         | Performance.....                                                                                            | 718  |
| 22.5           | Initialization/application information.....                                                                 | 722  |
| 22.5.1         | eDMA initialization.....                                                                                    | 722  |
| 22.5.2         | Programming errors.....                                                                                     | 724  |
| 22.5.3         | Arbitration mode considerations.....                                                                        | 725  |
| 22.5.4         | Performing DMA transfers.....                                                                               | 726  |
| 22.5.5         | Monitoring transfer descriptor status.....                                                                  | 730  |
| 22.5.6         | Channel Linking.....                                                                                        | 732  |
| 22.5.7         | Dynamic programming.....                                                                                    | 733  |

## Chapter 23

### Direct Memory Access Multiplexer (DMAMUX)

|        |                   |     |
|--------|-------------------|-----|
| 23.1   | Introduction..... | 739 |
| 23.1.1 | Overview.....     | 739 |

| Section number | Title                                                 | Page |
|----------------|-------------------------------------------------------|------|
| 23.1.2         | Features.....                                         | 740  |
| 23.1.3         | Modes of operation.....                               | 740  |
| 23.2           | External signal description.....                      | 741  |
| 23.3           | Memory map/register definition.....                   | 741  |
| 23.3.1         | Channel Configuration register (DMAMUX_CHCFGn).....   | 742  |
| 23.4           | Functional description.....                           | 743  |
| 23.4.1         | DMA channels with periodic triggering capability..... | 743  |
| 23.4.2         | DMA channels with no triggering capability.....       | 745  |
| 23.4.3         | Always-enabled DMA sources.....                       | 746  |
| 23.5           | Initialization/application information.....           | 747  |
| 23.5.1         | Reset.....                                            | 747  |
| 23.5.2         | Enabling and configuring sources.....                 | 747  |

## Chapter 24 Error Injection Module (EIM)

|        |                                                                                |     |
|--------|--------------------------------------------------------------------------------|-----|
| 24.1   | Introduction.....                                                              | 751 |
| 24.1.1 | Overview.....                                                                  | 751 |
| 24.1.2 | Features.....                                                                  | 752 |
| 24.2   | Memory map and register definition.....                                        | 753 |
| 24.2.1 | Error Injection Module Configuration Register (EIM_EIMCR).....                 | 754 |
| 24.2.2 | Error Injection Channel Enable register (EIM_EICHEN).....                      | 755 |
| 24.2.3 | Error Injection Channel Descriptor, Word0 (EIM_EICHD <sub>n</sub> _WORD0)..... | 756 |
| 24.2.4 | Error Injection Channel Descriptor, Word1 (EIM_EICHD <sub>n</sub> _WORD1)..... | 757 |
| 24.2.5 | Error Injection Channel Descriptor, Word2 (EIM_EICHD <sub>n</sub> _WORD2)..... | 757 |
| 24.3   | Functional description.....                                                    | 758 |

## Chapter 25 Dual PLL Digital Interface (PLLDIG)

|      |                    |     |
|------|--------------------|-----|
| 25.1 | Introduction.....  | 759 |
| 25.2 | Block Diagram..... | 759 |
| 25.3 | Features.....      | 759 |

| Section number | Title                                                          | Page |
|----------------|----------------------------------------------------------------|------|
| 25.4           | Modes of operation.....                                        | 760  |
| 25.4.1         | Normal mode with reference, PLL0 or both PLLs enabled.....     | 760  |
| 25.5           | Memory map and register definition.....                        | 761  |
| 25.5.1         | PLLDIG PLL0 Control Register (PLLDIG_PLL0CR).....              | 762  |
| 25.5.2         | PLLDIG PLL0 Status Register (PLLDIG_PLL0SR).....               | 764  |
| 25.5.3         | PLLDIG PLL0 Divider Register (PLLDIG_PLL0DV).....              | 766  |
| 25.5.4         | PLLDIG PLL1 Control Register (PLLDIG_PLL1CR).....              | 768  |
| 25.5.5         | PLLDIG PLL1 Status Register (PLLDIG_PLL1SR).....               | 770  |
| 25.5.6         | PLLDIG PLL1 Divider Register (PLLDIG_PLL1DV).....              | 771  |
| 25.5.7         | PLLDIG PLL1 Frequency Modulation Register (PLLDIG_PLL1FM)..... | 773  |
| 25.5.8         | PLLDIG PLL1 Fractional Divide Register (PLLDIG_PLL1FD).....    | 775  |
| 25.6           | Register classification for safety requirements.....           | 776  |
| 25.7           | Functional description.....                                    | 776  |
| 25.7.1         | Input clock frequency.....                                     | 776  |
| 25.7.2         | Clock configuration.....                                       | 776  |
| 25.7.3         | Loss of lock.....                                              | 778  |
| 25.7.4         | Frequency modulation.....                                      | 778  |
| 25.8           | Initialization information.....                                | 780  |

## Chapter 26 Clock Monitor Unit (CMU)

|        |                                                                |     |
|--------|----------------------------------------------------------------|-----|
| 26.1   | Introduction.....                                              | 781 |
| 26.1.1 | Main features.....                                             | 782 |
| 26.2   | Block diagram.....                                             | 782 |
| 26.3   | Signals.....                                                   | 782 |
| 26.4   | Register description and memory map.....                       | 783 |
| 26.4.1 | CMU Control Status Register (CMU_CSR).....                     | 784 |
| 26.4.2 | CMU Frequency Display Register (CMU_FDR).....                  | 785 |
| 26.4.3 | CMU High Frequency Reference Register CLKMN1 (CMU_HFREFR)..... | 786 |
| 26.4.4 | CMU Low Frequency Reference Register CLKMN1 (CMU_LFREFR).....  | 786 |

| Section number | Title                                            | Page |
|----------------|--------------------------------------------------|------|
| 26.4.5         | CMU Interrupt Status Register (CMU_ISR).....     | 787  |
| 26.4.6         | CMU Measurement Duration Register (CMU_MDR)..... | 789  |
| 26.5           | Functional description.....                      | 789  |
| 26.5.1         | Frequency meter.....                             | 789  |
| 26.5.2         | CLKMN0_RMT supervisor.....                       | 790  |
| 26.5.3         | CLKMN1 supervisor.....                           | 790  |

## Chapter 27

### Clock Generation Module (MC\_CGM)

|         |                                                                          |     |
|---------|--------------------------------------------------------------------------|-----|
| 27.1    | Introduction.....                                                        | 793 |
| 27.1.1  | Overview.....                                                            | 793 |
| 27.1.2  | Features.....                                                            | 794 |
| 27.2    | External Signal Description.....                                         | 795 |
| 27.3    | Memory Map and Register Definition.....                                  | 795 |
| 27.3.1  | PCS Switch Duration Register (MC_CGM_PCS_SDUR).....                      | 797 |
| 27.3.2  | PCS Divider Change Register 1 (MC_CGM_PCS_DIVC1).....                    | 797 |
| 27.3.3  | PCS Divider End Register 1 (MC_CGM_PCS_DIVE1).....                       | 798 |
| 27.3.4  | PCS Divider Start Register 1 (MC_CGM_PCS_DIVS1).....                     | 799 |
| 27.3.5  | PCS Divider Change Register 2 (MC_CGM_PCS_DIVC2).....                    | 800 |
| 27.3.6  | PCS Divider End Register 2 (MC_CGM_PCS_DIVE2).....                       | 800 |
| 27.3.7  | PCS Divider Start Register 2 (MC_CGM_PCS_DIVS2).....                     | 801 |
| 27.3.8  | PCS Divider Change Register 4 (MC_CGM_PCS_DIVC4).....                    | 802 |
| 27.3.9  | PCS Divider End Register 4 (MC_CGM_PCS_DIVE4).....                       | 803 |
| 27.3.10 | PCS Divider Start Register 4 (MC_CGM_PCS_DIVS4).....                     | 803 |
| 27.3.11 | System Clock Select Status Register (MC_CGM_SC_SS).....                  | 804 |
| 27.3.12 | System Clock Divider 0 Configuration Register (MC_CGM_SC_DC0).....       | 806 |
| 27.3.13 | Auxiliary Clock 0 Select Control Register (MC_CGM_AC0_SC).....           | 806 |
| 27.3.14 | Auxiliary Clock 0 Select Status Register (MC_CGM_AC0_SS).....            | 807 |
| 27.3.15 | Auxiliary Clock 0 Divider 0 Configuration Register (MC_CGM_AC0_DC0)..... | 808 |
| 27.3.16 | Auxiliary Clock 0 Divider 1 Configuration Register (MC_CGM_AC0_DC1)..... | 809 |

| Section number | Title                                                                      | Page |
|----------------|----------------------------------------------------------------------------|------|
| 27.3.17        | Auxiliary Clock 0 Divider 2 Configuration Register (MC_CGM_AC0_DC2).....   | 809  |
| 27.3.18        | Auxiliary Clock 1 Divider 0 Configuration Register (MC_CGM_AC1_DC0).....   | 810  |
| 27.3.19        | Auxiliary Clock 1 Divider 1 Configuration Register (MC_CGM_AC1_DC1).....   | 811  |
| 27.3.20        | Auxiliary Clock 2 Divider 0 Configuration Register (MC_CGM_AC2_DC0).....   | 812  |
| 27.3.21        | Auxiliary Clock 3 Select Control Register (MC_CGM_AC3_SC).....             | 813  |
| 27.3.22        | Auxiliary Clock 3 Select Status Register (MC_CGM_AC3_SS).....              | 814  |
| 27.3.23        | Auxiliary Clock 4 Select Control Register (MC_CGM_AC4_SC).....             | 815  |
| 27.3.24        | Auxiliary Clock 4 Select Status Register (MC_CGM_AC4_SS).....              | 816  |
| 27.3.25        | Auxiliary Clock 5 Select Control Register (MC_CGM_AC5_SC).....             | 816  |
| 27.3.26        | Auxiliary Clock 5 Select Status Register (MC_CGM_AC5_SS).....              | 817  |
| 27.3.27        | Auxiliary Clock 5 Divider 0 Configuration Register (MC_CGM_AC5_DC0).....   | 818  |
| 27.3.28        | Auxiliary Clock 6 Select Control Register (MC_CGM_AC6_SC).....             | 818  |
| 27.3.29        | Auxiliary Clock 6 Select Status Register (MC_CGM_AC6_SS).....              | 819  |
| 27.3.30        | Auxiliary Clock 6 Divider 0 Configuration Register (MC_CGM_AC6_DC0).....   | 820  |
| 27.3.31        | Auxiliary Clock 10 Select Control Register (MC_CGM_AC10_SC).....           | 821  |
| 27.3.32        | Auxiliary Clock 10 Select Status Register (MC_CGM_AC10_SS).....            | 822  |
| 27.3.33        | Auxiliary Clock 10 Divider 0 Configuration Register (MC_CGM_AC10_DC0)..... | 822  |
| 27.3.34        | Auxiliary Clock 11 Select Control Register (MC_CGM_AC11_SC).....           | 823  |
| 27.3.35        | Auxiliary Clock 11 Select Status Register (MC_CGM_AC11_SS).....            | 824  |
| 27.3.36        | Auxiliary Clock 11 Divider 0 Configuration Register (MC_CGM_AC11_DC0)..... | 825  |
| 27.4           | Functional Description.....                                                | 826  |
| 27.4.1         | System Clock Generation.....                                               | 826  |
| 27.4.2         | Auxiliary Clock Generation.....                                            | 829  |
| 27.4.3         | Dividers Functional Description.....                                       | 835  |

## Chapter 28 OSC Digital Interface (XOSC)

|        |                                               |     |
|--------|-----------------------------------------------|-----|
| 28.1   | Introduction.....                             | 837 |
| 28.2   | Functional description.....                   | 837 |
| 28.2.1 | Oscillator power-down control and status..... | 838 |

| Section number | Title                                     | Page |
|----------------|-------------------------------------------|------|
| 28.2.2         | Oscillator startup delay.....             | 838  |
| 28.2.3         | Oscillator clock available interrupt..... | 839  |
| 28.2.4         | Oscillator bypass mode.....               | 839  |
| 28.2.5         | Crystal oscillator mode selection.....    | 839  |
| 28.3           | Memory map and register definition.....   | 840  |
| 28.3.1         | XOSC Control Register (XOSC_CTL).....     | 841  |

## Chapter 29 IRCOSC Digital Interface

|        |                                           |     |
|--------|-------------------------------------------|-----|
| 29.1   | Introduction.....                         | 843 |
| 29.2   | Functional description.....               | 843 |
| 29.3   | Memory map and register definition.....   | 844 |
| 29.3.1 | IRCOSC Control Register (IRCOSC_CTL)..... | 844 |
| 29.3.2 | Frequency trimming calculation.....       | 845 |

## Chapter 30 RAM Controller (PRAMC)

|        |                                                          |     |
|--------|----------------------------------------------------------|-----|
| 30.1   | Introduction.....                                        | 847 |
| 30.2   | SRAM controller memory map and register definition.....  | 848 |
| 30.2.1 | Platform RAM Configuration Register 1 (PRAMC_PRCR1)..... | 849 |
| 30.3   | Functional description.....                              | 851 |
| 30.3.1 | Read and Write operations.....                           | 851 |
| 30.3.2 | Writes.....                                              | 852 |
| 30.4   | Initialization/application information.....              | 854 |
| 30.5   | Reliability considerations.....                          | 854 |
| 30.5.1 | Hsiao ECC algorithm.....                                 | 854 |
| 30.5.2 | Transaction monitor.....                                 | 857 |

## Chapter 31 Flash Memory Controller (PFLASH)

|      |                     |     |
|------|---------------------|-----|
| 31.1 | Introduction.....   | 859 |
| 31.2 | Features.....       | 859 |
| 31.3 | Block diagrams..... | 860 |

| Section number | Title                                                                           | Page |
|----------------|---------------------------------------------------------------------------------|------|
| 31.4           | Flash memory controller memory map.....                                         | 860  |
| 31.4.1         | Platform Flash Configuration Register 1 (PFLASH_PFCR1).....                     | 862  |
| 31.4.2         | Platform Flash Configuration Register 3 (PFLASH_PFCR3).....                     | 866  |
| 31.4.3         | Platform Flash Access Protection Register (PFLASH_PFAPR).....                   | 867  |
| 31.4.4         | Platform Flash Remap Control Register (PFLASH_PFCRCR).....                      | 870  |
| 31.4.5         | Platform Flash Remap Descriptor Enable Register (PFLASH_PFCRDE).....            | 872  |
| 31.4.6         | Platform Flash Calibration Region Descriptor n Word0 (PFLASH_PFCRDn_Word0)..... | 874  |
| 31.4.7         | Platform Flash Calibration Region Descriptor n Word1 (PFLASH_PFCRDn_Word1)..... | 874  |
| 31.4.8         | Platform Flash Calibration Region Descriptor n Word2 (PFLASH_PFCRDn_Word2)..... | 876  |
| 31.5           | Functional description.....                                                     | 881  |
| 31.5.1         | Basic interface protocol.....                                                   | 882  |
| 31.5.2         | Access protections.....                                                         | 882  |
| 31.5.3         | Access pipelining.....                                                          | 883  |
| 31.5.4         | Line read buffers and prefetch operation.....                                   | 883  |
| 31.5.5         | Instruction/Data prefetch triggering.....                                       | 885  |
| 31.5.6         | Per-Master prefetch triggering.....                                             | 885  |
| 31.5.7         | Buffer allocation.....                                                          | 885  |
| 31.5.8         | PFlash calibration remap support.....                                           | 885  |
| 31.5.9         | Reliability considerations.....                                                 | 888  |
| 31.5.10        | ECC on data flash accesses.....                                                 | 892  |
| 31.5.11        | Array integrity considerations.....                                             | 893  |

## Chapter 32

### Embedded Flash Memory (c55fmc)

|        |                                         |     |
|--------|-----------------------------------------|-----|
| 32.1   | Introduction.....                       | 895 |
| 32.1.1 | Overview.....                           | 896 |
| 32.1.2 | Features.....                           | 897 |
| 32.1.3 | Modes of operation.....                 | 897 |
| 32.2   | UTest NVM block.....                    | 898 |
| 32.3   | Memory map and register definition..... | 898 |

| Section number | Title                                                     | Page |
|----------------|-----------------------------------------------------------|------|
| 32.3.1         | Module Configuration Register (C55FMC_MCR).....           | 900  |
| 32.3.2         | Extended Module Configuration Register (C55FMC_MCRE)..... | 905  |
| 32.3.3         | Lock 0 register (C55FMC_LOCK0).....                       | 908  |
| 32.3.4         | Lock 1 register (C55FMC_LOCK1).....                       | 910  |
| 32.3.5         | Lock 2 register (C55FMC_LOCK2).....                       | 910  |
| 32.3.6         | Lock 3 register (C55FMC_LOCK3).....                       | 911  |
| 32.3.7         | Select 0 register (C55FMC_SEL0).....                      | 912  |
| 32.3.8         | Select 1 register (C55FMC_SEL1).....                      | 913  |
| 32.3.9         | Select 2 register (C55FMC_SEL2).....                      | 914  |
| 32.3.10        | Select 3 register (C55FMC_SEL3).....                      | 915  |
| 32.3.11        | Address register (C55FMC_ADR).....                        | 916  |
| 32.3.12        | UTest 0 register (C55FMC_UT0).....                        | 918  |
| 32.3.13        | UMISR register (C55FMC_UM <sub>n</sub> ).....             | 921  |
| 32.3.14        | UMISR register (C55FMC_UM9).....                          | 922  |
| 32.3.15        | Over-Program Protection 0 register (C55FMC_OPP0).....     | 923  |
| 32.3.16        | Over-Program Protection 1 register (C55FMC_OPP1).....     | 924  |
| 32.3.17        | Over-Program Protection 2 register (C55FMC_OPP2).....     | 925  |
| 32.3.18        | Over-Program Protection 3 register (C55FMC_OPP3).....     | 925  |
| 32.4           | Functional Description.....                               | 926  |
| 32.4.1         | User Mode.....                                            | 928  |
| 32.4.2         | Low Power mode.....                                       | 936  |
| 32.4.3         | UTest mode.....                                           | 936  |
| 32.5           | Initialization information.....                           | 940  |

## Chapter 33

### Flash OTP Control

|        |                                         |     |
|--------|-----------------------------------------|-----|
| 33.1   | Introduction.....                       | 943 |
| 33.2   | One Time Programmable (OTP) Blocks..... | 943 |
| 33.3   | OTP DCF Records.....                    | 943 |
| 33.3.1 | OTP Record - Low and Mid Blocks.....    | 943 |

| Section number | Title                               | Page |
|----------------|-------------------------------------|------|
| 33.3.2         | OTP Record - High Blocks.....       | 944  |
| 33.3.3         | OTP Record - Lower 256k Blocks..... | 944  |

## Chapter 34 Decorated Storage Memory Controller (DSMC)

|        |                                                                        |     |
|--------|------------------------------------------------------------------------|-----|
| 34.1   | Introduction.....                                                      | 945 |
| 34.2   | DSMC block diagram.....                                                | 947 |
| 34.3   | Decorated stores: st[b,h,w]d{cb}x rS,rA,rB.....                        | 949 |
| 34.3.1 | Bit Field Insert (BFINS) into an 8, 16 or 32-bit memory container..... | 950 |
| 34.4   | DSMC timing diagram.....                                               | 954 |
| 34.5   | DSMC instantiations.....                                               | 955 |

## Chapter 35 ADC Configuration

|        |                             |     |
|--------|-----------------------------|-----|
| 35.1   | Overview.....               | 957 |
| 35.2   | ADC configuration.....      | 958 |
| 35.2.1 | Block diagram.....          | 958 |
| 35.2.2 | CTU interface.....          | 959 |
| 35.2.3 | eTimer interface .....      | 960 |
| 35.2.4 | DMA interface .....         | 960 |
| 35.2.5 | FCCU interface .....        | 960 |
| 35.3   | ADC pin muxing.....         | 960 |
| 35.3.1 | ADC channel conversion..... | 963 |

## Chapter 36 Analog-to-Digital Converter (ADC)

|        |                                     |     |
|--------|-------------------------------------|-----|
| 36.1   | Introduction.....                   | 965 |
| 36.2   | Overview.....                       | 965 |
| 36.2.1 | Parts of the ADC.....               | 965 |
| 36.2.2 | ADC clock signals.....              | 966 |
| 36.2.3 | About ADC channels.....             | 967 |
| 36.3   | Features.....                       | 968 |
| 36.4   | Memory Map/Register Definition..... | 969 |

| Section number | Title                                                              | Page |
|----------------|--------------------------------------------------------------------|------|
| 36.4.1         | Main Configuration Register (ADC_MCR).....                         | 974  |
| 36.4.2         | Main Status register (ADC_MSR).....                                | 977  |
| 36.4.3         | Interrupt Status Register (ADC_ISR).....                           | 979  |
| 36.4.4         | Channel Pending register 0 (ADC_CEOCFR0).....                      | 980  |
| 36.4.5         | Interrupt Mask Register (ADC_IMR).....                             | 982  |
| 36.4.6         | Channel Interrupt Mask Register 0 (ADC_CIMR0).....                 | 982  |
| 36.4.7         | Watchdog Threshold Interrupt Status Register (ADC_WTISR).....      | 985  |
| 36.4.8         | Watchdog Threshold Interrupt Mask Register (ADC_WTIMR).....        | 988  |
| 36.4.9         | DMA Enable register (ADC_DMAE).....                                | 991  |
| 36.4.10        | DMA Channel Select Register 0 (ADC_DMAR0).....                     | 992  |
| 36.4.11        | Threshold Register (ADC_THRHLR $n$ ).....                          | 993  |
| 36.4.12        | Presampling Control Register (ADC_PSCR).....                       | 994  |
| 36.4.13        | Presampling register 0 (ADC_PSR0).....                             | 995  |
| 36.4.14        | Conversion Timing Register 0 (ADC_CTR0).....                       | 996  |
| 36.4.15        | Conversion Timing Register 1 (ADC_CTR1).....                       | 997  |
| 36.4.16        | Normal Conversion Mask Register 0 (ADC_NCMR0).....                 | 998  |
| 36.4.17        | Injected Conversion Mask Register 0 (ADC_JCMR0).....               | 999  |
| 36.4.18        | Power Down Exit Delay Register (ADC_PDEDR).....                    | 1001 |
| 36.4.19        | Channel Data Register $n$ (Precision Channels) (ADC_CDR $n$ )..... | 1002 |
| 36.4.20        | Threshold Register (ADC_THRHLR $n$ ).....                          | 1003 |
| 36.4.21        | Channel Watchdog Select Register 0 (ADC_CWSELR0).....              | 1003 |
| 36.4.22        | Channel Watchdog Select Register 1 (ADC_CWSELR1).....              | 1004 |
| 36.4.23        | Channel Watchdog Enable Register 0 (ADC_CWENR0).....               | 1005 |
| 36.4.24        | Analog Watchdog Out of Range Register 0 (ADC_AWORR0).....          | 1007 |
| 36.4.25        | Self Test Configuration Register 1 (ADC_STCR1).....                | 1009 |
| 36.4.26        | Self Test Configuration Register 2 (ADC_STCR2).....                | 1010 |
| 36.4.27        | Self Test Configuration Register 3 (ADC_STCR3).....                | 1012 |
| 36.4.28        | Self Test Baud Rate Register (ADC_STBRR).....                      | 1013 |
| 36.4.29        | Self Test Status Register 1 (ADC_STSR1).....                       | 1015 |

| Section number | Title                                                               | Page |
|----------------|---------------------------------------------------------------------|------|
| 36.4.30        | Self Test Status Register 2 (ADC_STSR2).....                        | 1018 |
| 36.4.31        | Self Test Status Register 3 (ADC_STSR3).....                        | 1019 |
| 36.4.32        | Self Test Status Register 4 (ADC_STSR4).....                        | 1019 |
| 36.4.33        | Self Test Data Register 1 (ADC_STDR1).....                          | 1020 |
| 36.4.34        | Self Test Data Register 2 (ADC_STDR2).....                          | 1022 |
| 36.4.35        | Self Test Analog Watchdog Register 0 (ADC_STAW0R).....              | 1023 |
| 36.4.36        | Self Test Analog Watchdog Register 1A (ADC_STAW1AR).....            | 1025 |
| 36.4.37        | Self Test Analog Watchdog Register 1B (ADC_STAW1BR).....            | 1026 |
| 36.4.38        | Self Test Analog Watchdog Register 2 (ADC_STAW2R).....              | 1027 |
| 36.4.39        | Self Test Analog Watchdog Register 4 (ADC_STAW4R).....              | 1028 |
| 36.4.40        | Self Test Analog Watchdog Register 5 (ADC_STAW5R).....              | 1029 |
| 36.4.41        | Calibration, BIST Control and status Register (ADC_CALBISTREG)..... | 1031 |
| 36.4.42        | Offset and Gain User Register (ADC_OFSGNUSR).....                   | 1033 |
| 36.5           | Functional description.....                                         | 1033 |
| 36.5.1         | Conversion.....                                                     | 1033 |
| 36.5.2         | Crosstriggering Unit interface.....                                 | 1039 |
| 36.5.3         | ADC clock prescaler and sample time settings.....                   | 1041 |
| 36.5.4         | Presampling.....                                                    | 1041 |
| 36.5.5         | Programmable analog watchdog.....                                   | 1043 |
| 36.5.6         | DMA functionality.....                                              | 1044 |
| 36.5.7         | Interrupts.....                                                     | 1045 |
| 36.5.8         | Power-Down mode.....                                                | 1046 |
| 36.5.9         | Auto-Clock-Off mode.....                                            | 1046 |
| 36.5.10        | Calibration and Self Test.....                                      | 1047 |
| 36.5.11        | Conversion time.....                                                | 1059 |
| 36.5.12        | Conversion data processing.....                                     | 1062 |
| 36.6           | Clock frequency.....                                                | 1062 |

## Chapter 37 Temperature Sensor (TSENS)

| Section number | Title                                                            | Page |
|----------------|------------------------------------------------------------------|------|
| 37.1           | Introduction.....                                                | 1063 |
| 37.2           | Functional Description.....                                      | 1063 |
| 37.2.1         | Temperature threshold detection (digital output generation)..... | 1064 |
| 37.2.2         | Linear temperature sensor (analog output generation).....        | 1065 |
| 37.3           | Temperature formula.....                                         | 1065 |
| 37.4           | Calculating device temperature.....                              | 1066 |

## Chapter 38 Sine Wave Generator (SGEN)

|        |                                                 |      |
|--------|-------------------------------------------------|------|
| 38.1   | Introduction.....                               | 1067 |
| 38.2   | Features.....                                   | 1067 |
| 38.3   | Memory map and register description.....        | 1068 |
| 38.3.1 | Control Register (SGEN_CTRL).....               | 1068 |
| 38.3.2 | Status Register (SGEN_STAT).....                | 1070 |
| 38.4   | Functional description.....                     | 1071 |
| 38.4.1 | Operation after a power-on reset.....           | 1071 |
| 38.4.2 | Output sine wave frequency.....                 | 1071 |
| 38.4.3 | Output sine wave amplitude.....                 | 1071 |
| 38.5   | Initialization and application information..... | 1072 |
| 38.5.1 | Changing the output frequency.....              | 1072 |
| 38.5.2 | Phase control of the sine wave output.....      | 1072 |
| 38.5.3 | Preserving the SGEN_CTRL data.....              | 1073 |

## Chapter 39 Enhanced Motor Control Timer (eTimer)

|        |                                   |      |
|--------|-----------------------------------|------|
| 39.1   | Introduction.....                 | 1075 |
| 39.1.1 | Overview.....                     | 1075 |
| 39.1.2 | Features.....                     | 1076 |
| 39.1.3 | Module block diagram.....         | 1076 |
| 39.1.4 | Channel Block Diagram.....        | 1077 |
| 39.2   | External Signal Descriptions..... | 1078 |

| Section number | Title                                                                   | Page |
|----------------|-------------------------------------------------------------------------|------|
| 39.2.1         | TIO[n:0] - Timer Input/Outputs.....                                     | 1078 |
| 39.2.2         | TAI[n:0] - Timer Auxiliary Inputs.....                                  | 1078 |
| 39.3           | Memory map and register definition.....                                 | 1079 |
| 39.3.1         | Channel n Compare Register 1 (ETIMER_CHn_COMP1).....                    | 1083 |
| 39.3.2         | Channel n Compare Register 2 (ETIMER_CHn_COMP2).....                    | 1083 |
| 39.3.3         | Channel n Capture Register 1 (ETIMER_CHn_CAPT1).....                    | 1084 |
| 39.3.4         | Channel n Capture Register 2 (ETIMER_CHn_CAPT2).....                    | 1084 |
| 39.3.5         | Channel n Load Register (ETIMER_CHn_LOAD).....                          | 1085 |
| 39.3.6         | Channel n Hold Register (ETIMER_CHn_HOLD).....                          | 1085 |
| 39.3.7         | Channel n Counter Register (ETIMER_CHn_CNTR).....                       | 1086 |
| 39.3.8         | Channel n Control Register 1 (ETIMER_CHn_CTRL1).....                    | 1086 |
| 39.3.9         | Channel n Control Register 2 (ETIMER_CHn_CTRL2).....                    | 1089 |
| 39.3.10        | Channel n Control Register 3 (ETIMER_CHn_CTRL3).....                    | 1091 |
| 39.3.11        | Channel n Status Register (ETIMER_CHn_STS).....                         | 1092 |
| 39.3.12        | Channel n Interrupt and DMA Enable Register (ETIMER_CHn_INTDMA).....    | 1094 |
| 39.3.13        | Channel n Comparator Load Register 1 (ETIMER_CHn_CMPLD1).....           | 1095 |
| 39.3.14        | Channel n Comparator Load Register 2 (ETIMER_CHn_CMPLD2).....           | 1096 |
| 39.3.15        | Channel n Compare and Capture Control Register (ETIMER_CHn_CCCTRL)..... | 1096 |
| 39.3.16        | Channel n Input Filter Register (ETIMER_CHn_FILT).....                  | 1098 |
| 39.3.17        | Watchdog Time-out Low Word Register (ETIMER_WDTOL).....                 | 1099 |
| 39.3.18        | Watchdog Time-out High Word Register (ETIMER_WDTH).....                 | 1100 |
| 39.3.19        | Channel Enable Register (ETIMER_ENBL).....                              | 1100 |
| 39.3.20        | DMA Request 0 Select Register (ETIMER_DREQ0).....                       | 1101 |
| 39.3.21        | DMA Request 1 Select Register (ETIMER_DREQ1).....                       | 1102 |
| 39.3.22        | DMA Request 2 Select Register (ETIMER_DREQ2).....                       | 1104 |
| 39.3.23        | DMA Request 3 Select Register (ETIMER_DREQ3).....                       | 1106 |
| 39.4           | Functional Description.....                                             | 1107 |
| 39.4.1         | General.....                                                            | 1107 |
| 39.4.2         | Counting Modes.....                                                     | 1109 |

| Section number | Title               | Page |
|----------------|---------------------|------|
| 39.4.3         | Other Features..... | 1116 |
| 39.5           | Resets.....         | 1118 |
| 39.6           | Clocks.....         | 1118 |
| 39.7           | Interrupts.....     | 1118 |
| 39.8           | DMA.....            | 1119 |

## Chapter 40

### Motor Control Pulse Width Modulator Module (FlexPWM)

|        |                                                             |      |
|--------|-------------------------------------------------------------|------|
| 40.1   | Introduction.....                                           | 1121 |
| 40.1.1 | Overview.....                                               | 1121 |
| 40.1.2 | Features.....                                               | 1121 |
| 40.1.3 | Modes of operation.....                                     | 1122 |
| 40.1.4 | Block Diagrams.....                                         | 1123 |
| 40.2   | External Signal Descriptions.....                           | 1125 |
| 40.2.1 | PWMA[n] and PWMB[n] - External PWM Pair.....                | 1125 |
| 40.2.2 | PWMX[n] - Auxiliary PWM signal.....                         | 1125 |
| 40.2.3 | FAULT[n] - Fault inputs.....                                | 1126 |
| 40.2.4 | EXT_SYNC - External Synchronization Signal.....             | 1126 |
| 40.2.5 | EXT_FORCE - External Output Force Signal.....               | 1126 |
| 40.2.6 | EXTA[n] and EXTB[n] - Alternate PWM Control Signals.....    | 1126 |
| 40.2.7 | OUT_TRIG0[n] and OUT_TRIG1[n] - Output Triggers.....        | 1126 |
| 40.2.8 | EXT_CLK - External Clock Signal.....                        | 1127 |
| 40.2.9 | EXT_SWITCH - External Switch Signal.....                    | 1127 |
| 40.3   | Memory Map and Registers.....                               | 1127 |
| 40.3.1 | Submodule n Counter Register (FlexPWM_SUBn_CNT).....        | 1132 |
| 40.3.2 | Submodule n Initial Count Register (FlexPWM_SUBn_INIT)..... | 1132 |
| 40.3.3 | Submodule n Control 2 Register (FlexPWM_SUBn_CTRL2).....    | 1133 |
| 40.3.4 | Submodule n Control 1 Register (FlexPWM_SUBn_CTRL1).....    | 1135 |
| 40.3.5 | Submodule n Value Register 0 (FlexPWM_SUBn_VAL0).....       | 1137 |
| 40.3.6 | Submodule n Value Register 1 (FlexPWM_SUBn_VAL1).....       | 1138 |

| Section number | Title                                                                   | Page |
|----------------|-------------------------------------------------------------------------|------|
| 40.3.7         | Submodule n Value Register 2 (FlexPWM_SUBn_VAL2).....                   | 1139 |
| 40.3.8         | Submodule n Value Register 3 (FlexPWM_SUBn_VAL3).....                   | 1139 |
| 40.3.9         | Submodule n Value Register 4 (FlexPWM_SUBn_VAL4).....                   | 1140 |
| 40.3.10        | Submodule n Value Register 5 (FlexPWM_SUBn_VAL5).....                   | 1141 |
| 40.3.11        | Submodule n Output Control Register (FlexPWM_SUBn_OCTRL).....           | 1141 |
| 40.3.12        | Submodule n Status Register (FlexPWM_SUBn_STS).....                     | 1143 |
| 40.3.13        | Submodule n Interrupt Enable Register (FlexPWM_SUBn_INTEN).....         | 1144 |
| 40.3.14        | Submodule n DMA Enable Register (FlexPWM_SUBn_DMAEN).....               | 1146 |
| 40.3.15        | Submodule n Output Trigger Control Register (FlexPWM_SUBn_TCTRL).....   | 1147 |
| 40.3.16        | Submodule n Fault Disable Mapping Register (FlexPWM_SUBn_DISMAP).....   | 1148 |
| 40.3.17        | Submodule n Deadtime Count Register 0 (FlexPWM_SUBn_DTCNT0).....        | 1149 |
| 40.3.18        | Submodule n Deadtime Count Register 1 (FlexPWM_SUBn_DTCNT1).....        | 1150 |
| 40.3.19        | Submodule n Capture Control X Register (FlexPWM_SUBn_CAPTCTRLX).....    | 1151 |
| 40.3.20        | Submodule n Capture Compare X Register (FlexPWM_SUBn_CAPTCMPX).....     | 1152 |
| 40.3.21        | Submodule n Capture Value 0 Register (FlexPWM_SUBn_CVAL0).....          | 1153 |
| 40.3.22        | Submodule n Capture Value 0 Cycle Register (FlexPWM_SUBn_CVAL0CYC)..... | 1154 |
| 40.3.23        | Submodule n Capture Value 1 Register (FlexPWM_SUBn_CVAL1).....          | 1154 |
| 40.3.24        | Submodule n Capture Value 1 Cycle Register (FlexPWM_SUBn_CVAL1CYC)..... | 1155 |
| 40.3.25        | Output Enable Register (FlexPWM_OUTEN).....                             | 1155 |
| 40.3.26        | Mask Register (FlexPWM_MASK).....                                       | 1157 |
| 40.3.27        | Software Controlled Output Register (FlexPWM_SWCOUT).....               | 1158 |
| 40.3.28        | Deadtime Source Select Register (FlexPWM_DT_SRCSEL).....                | 1160 |
| 40.3.29        | Master Control Register (FlexPWM_MCTRL).....                            | 1162 |
| 40.3.30        | Reserved Register (FlexPWM_RESERVED).....                               | 1164 |
| 40.3.30        | Fault Control Register (FlexPWM_FCTRL).....                             | 1164 |
| 40.3.31        | Fault Status Register (FlexPWM_FSTS).....                               | 1166 |
| 40.3.32        | Fault Filter Register (FlexPWM_FFILT).....                              | 1167 |
| 40.3.33        | Input Filter Considerations.....                                        | 1168 |
| 40.4           | Functional Description.....                                             | 1169 |

| Section number | Title                      | Page |
|----------------|----------------------------|------|
| 40.4.1         | PWM Capabilities.....      | 1169 |
| 40.4.2         | Functional Details.....    | 1180 |
| 40.4.3         | PWM Generator Loading..... | 1198 |
| 40.5           | Resets.....                | 1201 |
| 40.6           | Interrupts.....            | 1201 |
| 40.7           | DMA.....                   | 1202 |

## Chapter 41 Cross-Triggering Unit (CTU)

|         |                                                                                     |      |
|---------|-------------------------------------------------------------------------------------|------|
| 41.1    | Introduction.....                                                                   | 1205 |
| 41.2    | Block diagram.....                                                                  | 1206 |
| 41.3    | CTU overview.....                                                                   | 1206 |
| 41.3.1  | Interaction with other peripherals.....                                             | 1207 |
| 41.3.2  | Modes of operation.....                                                             | 1208 |
| 41.4    | Signal description.....                                                             | 1209 |
| 41.5    | Memory Map and Registers.....                                                       | 1209 |
| 41.5.1  | Trigger Generator Subunit Input Selection Register (CTU_TGSISR).....                | 1214 |
| 41.5.2  | Trigger Generator Subunit Control Register (CTU_TGSCR).....                         | 1218 |
| 41.5.3  | Trigger Compare Register (CTU_TnCR).....                                            | 1219 |
| 41.5.4  | TGS Counter Compare Register (CTU_TGSCCR).....                                      | 1219 |
| 41.5.5  | TGS Counter Reload Register (CTU_TGSCRR).....                                       | 1219 |
| 41.5.6  | Commands List Control Register 1 (CTU_CLCR1).....                                   | 1220 |
| 41.5.7  | Commands List Control Register 2 (CTU_CLCR2).....                                   | 1220 |
| 41.5.8  | Trigger Handler Control Register 1 (CTU_THCR1).....                                 | 1221 |
| 41.5.9  | Trigger Handler Control Register 2 (CTU_THCR2).....                                 | 1225 |
| 41.5.10 | Commands List Register A for ADC single-conversion mode commands (CTU_CLR_A_n)..... | 1228 |
| 41.5.11 | Command List Register B for ADC dual-conversion mode commands (CTU_CLR_B_n).....    | 1229 |
| 41.5.12 | Command List Register C for self-test commands (CTU_CLR_C_n).....                   | 1230 |
| 41.5.13 | FIFO DMA Control Register (CTU_FDCR).....                                           | 1231 |
| 41.5.14 | FIFO Control Register (CTU_FCR).....                                                | 1233 |

| Section number | Title                                                              | Page |
|----------------|--------------------------------------------------------------------|------|
| 41.5.15        | FIFO Threshold Register (CTU_FTH).....                             | 1235 |
| 41.5.16        | FIFO Status Register (CTU_FST).....                                | 1236 |
| 41.5.17        | FIFO Right Aligned Data Register (CTU_FR <sub>n</sub> ).....       | 1238 |
| 41.5.18        | FIFO Signed Left Aligned Data Register (CTU_FL <sub>n</sub> )..... | 1239 |
| 41.5.19        | Error Flag Register (CTU_EFR).....                                 | 1240 |
| 41.5.20        | Interrupt Flag Register (CTU_IFR).....                             | 1242 |
| 41.5.21        | Interrupt/DMA Register (CTU_IR).....                               | 1243 |
| 41.5.22        | Control ON Time Register (CTU_COTR).....                           | 1245 |
| 41.5.23        | Control Register (CTU_CR).....                                     | 1245 |
| 41.5.24        | Digital Filter Register (CTU_DFR).....                             | 1247 |
| 41.5.25        | Expected Value A Register (CTU_EXPAR).....                         | 1248 |
| 41.5.26        | Expected Value B Register (CTU_EXPBR).....                         | 1248 |
| 41.5.27        | Counter Range Register (CTU_CNTRNGR).....                          | 1249 |
| 41.5.28        | List Control/Status Register (CTU_LISTCSR).....                    | 1250 |
| 41.6           | Functional description.....                                        | 1251 |
| 41.6.1         | Trigger Generator subunit (TGS).....                               | 1251 |
| 41.6.2         | TGS in triggered mode.....                                         | 1252 |
| 41.6.3         | TGS in sequential mode.....                                        | 1254 |
| 41.6.4         | TGS counter.....                                                   | 1255 |
| 41.6.5         | Scheduler subunit (SU).....                                        | 1257 |
| 41.6.6         | ADC commands list.....                                             | 1258 |
| 41.6.7         | ADC command list format.....                                       | 1259 |
| 41.6.8         | ADC command list operation modes.....                              | 1261 |
| 41.6.9         | ADC results FIFOs.....                                             | 1262 |
| 41.6.10        | Reload mechanism.....                                              | 1264 |
| 41.7           | Interrupts and DMA Requests.....                                   | 1266 |
| 41.7.1         | DMA support.....                                                   | 1266 |
| 41.7.2         | CTU faults and errors.....                                         | 1266 |
| 41.7.3         | CTU interrupt/DMA requests.....                                    | 1268 |

| Section number | Title                           | Page |
|----------------|---------------------------------|------|
| 41.8           | Self test mode.....             | 1268 |
| 41.8.1         | Self-test execution errors..... | 1271 |
| 41.9           | Power saving modes.....         | 1271 |
| 41.9.1         | STOP mode.....                  | 1271 |

## Chapter 42 System Timer Module (STM)

|        |                                                             |      |
|--------|-------------------------------------------------------------|------|
| 42.1   | Introduction.....                                           | 1273 |
| 42.1.1 | Overview.....                                               | 1273 |
| 42.1.2 | Features.....                                               | 1273 |
| 42.1.3 | Modes of operation.....                                     | 1273 |
| 42.2   | External signal description.....                            | 1274 |
| 42.3   | Memory map and registers.....                               | 1274 |
| 42.3.1 | STM Control Register (STM_CR).....                          | 1275 |
| 42.3.2 | STM Count Register (STM_CNT).....                           | 1276 |
| 42.3.3 | STM Channel Control Register (STM_CCR <sub>n</sub> ).....   | 1276 |
| 42.3.4 | STM Channel Interrupt Register (STM_CIR <sub>n</sub> )..... | 1277 |
| 42.3.5 | STM Channel Compare Register (STM_CMP <sub>n</sub> ).....   | 1277 |
| 42.4   | Functional description.....                                 | 1278 |

## Chapter 43 Software Watchdog Timer (SWT)

|        |                                      |      |
|--------|--------------------------------------|------|
| 43.1   | Introduction.....                    | 1279 |
| 43.1.1 | Overview.....                        | 1279 |
| 43.1.2 | Features.....                        | 1279 |
| 43.1.3 | Modes of operation.....              | 1280 |
| 43.2   | External signal description.....     | 1280 |
| 43.3   | Memory Map and Registers.....        | 1280 |
| 43.3.1 | SWT Control Register (SWT_CR).....   | 1281 |
| 43.3.2 | SWT Interrupt Register (SWT_IR)..... | 1284 |
| 43.3.3 | SWT Time-out Register (SWT_TO).....  | 1284 |

| Section number | Title                                     | Page |
|----------------|-------------------------------------------|------|
| 43.3.4         | SWT Window Register (SWT_WN).....         | 1285 |
| 43.3.5         | SWT Service Register (SWT_SR).....        | 1285 |
| 43.3.6         | SWT Counter Output Register (SWT_CO)..... | 1286 |
| 43.3.7         | SWT Service Key Register (SWT_SK).....    | 1287 |
| 43.4           | Functional description.....               | 1287 |
| 43.4.1         | Introduction.....                         | 1287 |
| 43.4.2         | Configuration locking.....                | 1288 |
| 43.4.3         | Unlock sequence.....                      | 1289 |
| 43.4.4         | Servicing operations.....                 | 1289 |
| 43.4.5         | Time-out.....                             | 1290 |
| 43.4.6         | Initialization.....                       | 1291 |

## Chapter 44 Periodic Interrupt Timer (PIT)

|        |                                                            |      |
|--------|------------------------------------------------------------|------|
| 44.1   | Introduction.....                                          | 1293 |
| 44.1.1 | Block diagram.....                                         | 1293 |
| 44.1.2 | Features.....                                              | 1294 |
| 44.2   | Signal description.....                                    | 1294 |
| 44.3   | Memory map/register description.....                       | 1295 |
| 44.3.1 | PIT Module Control Register (PIT_MCR).....                 | 1295 |
| 44.3.2 | PIT Upper Lifetime Timer Register (PIT_LTMR64H).....       | 1297 |
| 44.3.3 | PIT Lower Lifetime Timer Register (PIT_LTMR64L).....       | 1297 |
| 44.3.4 | Timer Load Value Register (PIT_LDVAL <sub>n</sub> ).....   | 1298 |
| 44.3.5 | Current Timer Value Register (PIT_CVAL <sub>n</sub> )..... | 1298 |
| 44.3.6 | Timer Control Register (PIT_TCTRL <sub>n</sub> ).....      | 1299 |
| 44.3.7 | Timer Flag Register (PIT_TFLG <sub>n</sub> ).....          | 1300 |
| 44.4   | Functional description.....                                | 1300 |
| 44.4.1 | General operation.....                                     | 1300 |
| 44.4.2 | Interrupts.....                                            | 1302 |
| 44.4.3 | Chained timers.....                                        | 1302 |

| Section number | Title                                             | Page |
|----------------|---------------------------------------------------|------|
| 44.5           | Initialization and application information.....   | 1302 |
| 44.6           | Example configuration for chained timers.....     | 1303 |
| 44.7           | Example configuration for the lifetime timer..... | 1304 |

## Chapter 45 CAN (FlexCAN)

|         |                                                       |      |
|---------|-------------------------------------------------------|------|
| 45.1    | Introduction.....                                     | 1307 |
| 45.1.1  | Overview.....                                         | 1308 |
| 45.1.2  | FlexCAN module features.....                          | 1309 |
| 45.1.3  | Modes of operation.....                               | 1310 |
| 45.2    | FlexCAN signal descriptions.....                      | 1312 |
| 45.2.1  | CAN Rx .....                                          | 1312 |
| 45.2.2  | CAN Tx .....                                          | 1312 |
| 45.3    | Memory map/register definition.....                   | 1312 |
| 45.3.1  | FlexCAN memory mapping.....                           | 1312 |
| 45.3.2  | Module Configuration Register (CAN_MCR).....          | 1318 |
| 45.3.3  | Control 1 register (CAN_CTRL1).....                   | 1323 |
| 45.3.4  | Free Running Timer (CAN_TIMER).....                   | 1326 |
| 45.3.5  | Rx Mailboxes Global Mask Register (CAN_RXMGMASK)..... | 1327 |
| 45.3.6  | Rx 14 Mask register (CAN_RX14MASK).....               | 1328 |
| 45.3.7  | Rx 15 Mask register (CAN_RX15MASK).....               | 1329 |
| 45.3.8  | Error Counter (CAN_ECR).....                          | 1329 |
| 45.3.9  | Error and Status 1 register (CAN_ESR1).....           | 1331 |
| 45.3.10 | Interrupt Masks 2 register (CAN_IMASK2).....          | 1335 |
| 45.3.11 | Interrupt Masks 1 register (CAN_IMASK1).....          | 1335 |
| 45.3.12 | Interrupt Flags 2 register (CAN_IFLAG2).....          | 1336 |
| 45.3.13 | Interrupt Flags 1 register (CAN_IFLAG1).....          | 1337 |
| 45.3.14 | Control 2 register (CAN_CTRL2).....                   | 1339 |
| 45.3.15 | Error and Status 2 register (CAN_ESR2).....           | 1343 |
| 45.3.16 | CRC Register (CAN_CRCCR).....                         | 1344 |

| Section number | Title                                                       | Page |
|----------------|-------------------------------------------------------------|------|
| 45.3.17        | Rx FIFO Global Mask register (CAN_RXFGMASK).....            | 1345 |
| 45.3.18        | Rx FIFO Information Register (CAN_RXFIR).....               | 1346 |
| 45.3.19        | Rx Individual Mask Registers (CAN_RXIMR <sub>n</sub> )..... | 1346 |
| 45.3.20        | Memory Error Control Register (CAN_MECR).....               | 1347 |
| 45.3.21        | Error Injection Address Register (CAN_ERRIAR).....          | 1349 |
| 45.3.22        | Error Injection Data Pattern Register (CAN_ERRIDPR).....    | 1350 |
| 45.3.23        | Error Injection Parity Pattern Register (CAN_ERRIPPR).....  | 1351 |
| 45.3.24        | Error Report Address Register (CAN_RERRAR).....             | 1351 |
| 45.3.25        | Error Report Data Register (CAN_RERRDR).....                | 1353 |
| 45.3.26        | Error Report Syndrome Register (CAN_RERRSYNR).....          | 1353 |
| 45.3.27        | Error Status Register (CAN_ERRSR).....                      | 1356 |
| 45.3.28        | Message buffer structure.....                               | 1357 |
| 45.3.29        | Rx FIFO structure.....                                      | 1363 |
| 45.4           | Functional description.....                                 | 1365 |
| 45.4.1         | Transmit process.....                                       | 1366 |
| 45.4.2         | Arbitration process.....                                    | 1366 |
| 45.4.3         | Receive process.....                                        | 1370 |
| 45.4.4         | Matching process.....                                       | 1372 |
| 45.4.5         | Move process.....                                           | 1377 |
| 45.4.6         | Data coherence.....                                         | 1378 |
| 45.4.7         | Rx FIFO.....                                                | 1382 |
| 45.4.8         | CAN protocol related features.....                          | 1383 |
| 45.4.9         | Clock domains and restrictions.....                         | 1390 |
| 45.4.10        | Modes of operation details.....                             | 1391 |
| 45.4.11        | Interrupts.....                                             | 1393 |
| 45.4.12        | Bus interface.....                                          | 1394 |
| 45.4.13        | Detection and Correction of Memory Errors.....              | 1395 |
| 45.5           | Initialization/application information.....                 | 1399 |
| 45.5.1         | FlexCAN initialization sequence.....                        | 1399 |

| Section number    | Title                         | Page |
|-------------------|-------------------------------|------|
| <b>Chapter 46</b> |                               |      |
| <b>Zipwire</b>    |                               |      |
| 46.1              | Overview.....                 | 1401 |
| 46.2              | Introduction.....             | 1401 |
| 46.3              | Zipwire Block Diagram.....    | 1402 |
| 46.4              | Architecture.....             | 1402 |
| 46.5              | Zipwire interconnections..... | 1403 |
| 46.6              | Zipwire performance.....      | 1404 |
| 46.6.1            | Read performance.....         | 1404 |
| 46.6.2            | Write performance.....        | 1406 |

## Chapter 47

### Serial Interprocessor Interface (SIPI)

|        |                                    |      |
|--------|------------------------------------|------|
| 47.1   | Introduction.....                  | 1409 |
| 47.1.1 | Scalability.....                   | 1409 |
| 47.2   | Overview.....                      | 1410 |
| 47.3   | SIPI block diagram.....            | 1412 |
| 47.4   | Feature description.....           | 1412 |
| 47.4.1 | Main features.....                 | 1412 |
| 47.4.2 | Standard features.....             | 1413 |
| 47.5   | SIPI operation from reset.....     | 1413 |
| 47.6   | Functional description.....        | 1413 |
| 47.6.1 | External signals.....              | 1413 |
| 47.6.2 | Frame format.....                  | 1414 |
| 47.7   | Transfer types.....                | 1420 |
| 47.7.1 | Read transfer.....                 | 1420 |
| 47.7.2 | Register read answer transfer..... | 1421 |
| 47.7.3 | Register Write transfer.....       | 1422 |
| 47.7.4 | Write Acknowledge transfer.....    | 1425 |
| 47.7.5 | ID request response.....           | 1425 |

| Section number | Title                                              | Page |
|----------------|----------------------------------------------------|------|
| 47.8           | Transfer API and flow charts.....                  | 1427 |
| 47.9           | DMA programming sequence.....                      | 1434 |
| 47.10          | Modes of operation.....                            | 1435 |
| 47.10.1        | Initialization mode.....                           | 1435 |
| 47.10.2        | Normal mode.....                                   | 1435 |
| 47.10.3        | Module Disable (MD).....                           | 1436 |
| 47.11          | Errors.....                                        | 1436 |
| 47.11.1        | Timeout error.....                                 | 1436 |
| 47.11.2        | CRC error.....                                     | 1436 |
| 47.11.3        | Maximum count reached error.....                   | 1437 |
| 47.11.4        | Transaction ID error.....                          | 1437 |
| 47.11.5        | Acknowledge error.....                             | 1437 |
| 47.12          | CRC calculation.....                               | 1437 |
| 47.13          | Interrupt logic.....                               | 1438 |
| 47.14          | SIPI control and status overview.....              | 1439 |

| 47.15.30       | SIPI Status Register (SIPI_SR).....                | 1478 |
| 47.15.31       | SIPI Max Count Register (SIPI_MAXCR).....          | 1480 |
| 47.15.32       | SIPI Address Reload Register (SIPI_ARR).....       | 1480 |
| 47.15.33       | SIPI Address Count Register (SIPI_ACR).....        | 1481 |
| 47.15.34       | SIPI Error Register (SIPI_ERR).....                | 1482 |

## Chapter 48

### LVDS Fast Asynchronous Serial Transmission (LFAST) – Interprocessor Communications

|        |                                 |      |
|--------|---------------------------------|------|
| 48.1   | Introduction.....               | 1485 |
| 48.2   | Block diagram .....             | 1485 |
| 48.3   | External signals.....           | 1486 |
| 48.3.1 | LFAST operating data rates..... | 1486 |
| 48.4   | LFAST frame structure.....      | 1487 |

| Section number | Title                                                                 | Page |
|----------------|-----------------------------------------------------------------------|------|
| 48.5           | Features.....                                                         | 1490 |
| 48.6           | Memory map and register definition.....                               | 1491 |
| 48.6.1         | LFAST Mode Configuration Register (LFAST_MCR).....                    | 1493 |
| 48.6.2         | LFAST Speed Control Register (LFAST_SCR).....                         | 1495 |
| 48.6.3         | LFAST Correlator Control Register (LFAST_COCR).....                   | 1496 |
| 48.6.4         | LFAST Test Mode Control Register (LFAST_TMCR).....                    | 1498 |
| 48.6.5         | LFAST Auto Loopback Control Register (LFAST_ALCR).....                | 1499 |
| 48.6.6         | LFAST Rate Change Delay Control Register (LFAST_RCDCR).....           | 1500 |
| 48.6.7         | LFAST Wakeup Delay Control Register (LFAST_SLCR).....                 | 1500 |
| 48.6.8         | LFAST ICLC Control Register (LFAST_ICR).....                          | 1502 |
| 48.6.9         | LFAST Ping Control Register (LFAST_PICR).....                         | 1503 |
| 48.6.10        | LFAST Rx FIFO CTS Control Register (LFAST_RFCR).....                  | 1503 |
| 48.6.11        | LFAST Tx Interrupt Enable Register (LFAST_TIER).....                  | 1504 |
| 48.6.12        | LFAST Rx Interrupt Enable Register (LFAST_RIER).....                  | 1505 |
| 48.6.13        | LFAST Rx ICLC Interrupt Enable Register (LFAST_RIIER).....            | 1507 |
| 48.6.14        | LFAST PLL Control Register (LFAST_PLLCR).....                         | 1509 |
| 48.6.15        | LFAST LVDS Control Register (LFAST_LCR).....                          | 1511 |
| 48.6.16        | LFAST Unsolicited Tx Control Register (LFAST_UNSTCR).....             | 1514 |
| 48.6.17        | LFAST Unsolicited Tx Data Registers (LFAST_UNSTDR <sub>n</sub> )..... | 1514 |
| 48.6.18        | LFAST Global Status Register (LFAST_GSR).....                         | 1515 |
| 48.6.19        | LFAST Ping Status Register (LFAST_PISR).....                          | 1516 |
| 48.6.20        | LFAST Data Frame Status Register (LFAST_DFSR).....                    | 1517 |
| 48.6.21        | LFAST Tx Interrupt Status Register (LFAST_TISR).....                  | 1518 |
| 48.6.22        | LFAST Rx Interrupt Status Register (LFAST_RISR).....                  | 1519 |
| 48.6.23        | LFAST Rx ICLC Interrupt Status Register (LFAST_RIISR).....            | 1521 |
| 48.6.24        | LFAST PLL and LVDS Status Register (LFAST_PLLLSR).....                | 1523 |
| 48.6.25        | LFAST Unsolicited Rx Status Register (LFAST_UNSRSR).....              | 1524 |
| 48.6.26        | LFAST Unsolicited Rx Data Register (LFAST_UNSRDR <sub>n</sub> ).....  | 1525 |
| 48.7           | Functional description.....                                           | 1525 |

| Section number | Title                                                   | Page |
|----------------|---------------------------------------------------------|------|
| 48.7.1         | Startup procedure.....                                  | 1525 |
| 48.7.2         | Line Receiver.....                                      | 1529 |
| 48.7.3         | Transmit Controller.....                                | 1538 |
| 48.7.4         | CTS mode support.....                                   | 1543 |
| 48.7.5         | Frames supported.....                                   | 1544 |
| 48.7.6         | Frame flow.....                                         | 1545 |
| 48.7.7         | Test and Debug Support.....                             | 1552 |
| 48.7.8         | Interrupts.....                                         | 1561 |
| 48.8           | Packet memory.....                                      | 1564 |
| 48.9           | Resets.....                                             | 1565 |
| 48.10          | Clocks.....                                             | 1566 |
| 48.10.1        | Clocking strategy.....                                  | 1566 |
| 48.10.2        | Slow speed clock.....                                   | 1567 |
| 48.10.3        | Rx Controller Clocks.....                               | 1570 |
| 48.10.4        | Clocking Module Requirements for High Speed Phases..... | 1570 |
| 48.10.5        | Clock module requirements for low speed phases.....     | 1571 |
| 48.10.6        | Tx Controller Clocks.....                               | 1572 |

## Chapter 49 Serial Peripheral Interface (SPI)

|        |                                                                       |      |
|--------|-----------------------------------------------------------------------|------|
| 49.1   | Introduction.....                                                     | 1575 |
| 49.1.1 | Block Diagram.....                                                    | 1575 |
| 49.1.2 | Features.....                                                         | 1576 |
| 49.1.3 | Interface configurations.....                                         | 1578 |
| 49.1.4 | Modes of Operation.....                                               | 1578 |
| 49.2   | Module signal descriptions.....                                       | 1580 |
| 49.2.1 | PCS0/SS—Peripheral Chip Select/Slave Select.....                      | 1580 |
| 49.2.2 | PCS1—PCS3—Peripheral Chip Selects 1–3.....                            | 1581 |
| 49.2.3 | PCS4—Peripheral Chip Select 4.....                                    | 1581 |
| 49.2.4 | PCS5/PCSS—Peripheral Chip Select 5/Peripheral Chip Select Strobe..... | 1581 |

| Section number | Title                                                                                      | Page |
|----------------|--------------------------------------------------------------------------------------------|------|
| 49.2.5         | PCS6–PCS7—Peripheral Chip Selects 6–7.....                                                 | 1581 |
| 49.2.6         | SCK—Serial Clock.....                                                                      | 1581 |
| 49.2.7         | SIN—Serial Input.....                                                                      | 1582 |
| 49.2.8         | SOUT—Serial Output.....                                                                    | 1582 |
| 49.3           | Memory Map/Register Definition.....                                                        | 1582 |
| 49.3.1         | Module Configuration Register (SPI_MCR).....                                               | 1584 |
| 49.3.2         | Transfer Count Register (SPI_TCR).....                                                     | 1587 |
| 49.3.3         | Clock and Transfer Attributes Register (In Master Mode) (SPI_CTAR <sub>n</sub> ).....      | 1587 |
| 49.3.4         | Clock and Transfer Attributes Register (In Slave Mode) (SPI_CTAR <sub>n</sub> _SLAVE)..... | 1592 |
| 49.3.5         | Status Register (SPI_SR).....                                                              | 1594 |
| 49.3.6         | DMA/Interrupt Request Select and Enable Register (SPI_RSER).....                           | 1597 |
| 49.3.7         | PUSH TX FIFO Register In Master Mode (SPI_PUSHR).....                                      | 1599 |
| 49.3.8         | PUSH TX FIFO Register In Slave Mode (SPI_PUSHR_SLAVE).....                                 | 1600 |
| 49.3.9         | POP RX FIFO Register (SPI_POPR).....                                                       | 1601 |
| 49.3.10        | Transmit FIFO Registers (SPI_TXFR <sub>n</sub> ).....                                      | 1602 |
| 49.3.11        | Receive FIFO Registers (SPI_RXFR <sub>n</sub> ).....                                       | 1602 |
| 49.4           | Functional description.....                                                                | 1603 |
| 49.4.1         | Start and Stop of module transfers.....                                                    | 1604 |
| 49.4.2         | Serial Peripheral Interface (SPI) configuration.....                                       | 1604 |
| 49.4.3         | Module baud rate and clock delay generation.....                                           | 1608 |
| 49.4.4         | Transfer formats.....                                                                      | 1612 |
| 49.4.5         | Continuous Serial Communications Clock.....                                                | 1621 |
| 49.4.6         | Slave Mode Operation Constraints.....                                                      | 1623 |
| 49.4.7         | Interrupts/DMA requests.....                                                               | 1623 |
| 49.4.8         | Power saving features.....                                                                 | 1625 |
| 49.5           | Initialization/application information.....                                                | 1626 |
| 49.5.1         | How to manage queues.....                                                                  | 1627 |
| 49.5.2         | Switching Master and Slave mode.....                                                       | 1627 |
| 49.5.3         | Initializing Module in Master/Slave Modes.....                                             | 1628 |

| Section number | Title                                      | Page |
|----------------|--------------------------------------------|------|
| 49.5.4         | Baud rate settings.....                    | 1628 |
| 49.5.5         | Delay settings.....                        | 1629 |
| 49.5.6         | Calculation of FIFO pointer addresses..... | 1630 |

## Chapter 50 FlexRay Communication Controller (FlexRay)

|        |                                                                        |      |
|--------|------------------------------------------------------------------------|------|
| 50.1   | Introduction.....                                                      | 1633 |
| 50.1.1 | Reference.....                                                         | 1633 |
| 50.1.2 | Glossary.....                                                          | 1633 |
| 50.1.3 | Overview.....                                                          | 1635 |
| 50.1.4 | Features.....                                                          | 1637 |
| 50.1.5 | Modes of Operation.....                                                | 1639 |
| 50.2   | External Signal Description.....                                       | 1640 |
| 50.2.1 | Detailed Signal Descriptions.....                                      | 1640 |
| 50.3   | Controller Host Interface Clocking.....                                | 1642 |
| 50.4   | Protocol Engine Clocking.....                                          | 1642 |
| 50.4.1 | Oscillator Clocking.....                                               | 1642 |
| 50.4.2 | PLL Clocking.....                                                      | 1642 |
| 50.5   | Register Descriptions.....                                             | 1643 |
| 50.5.1 | Register Reset.....                                                    | 1643 |
| 50.5.2 | Register Write Access.....                                             | 1644 |
| 50.6   | Memory map and register definition.....                                | 1645 |
| 50.6.1 | Module Version Register (FR_MVR).....                                  | 1667 |
| 50.6.2 | Module Configuration Register (FR_MCR).....                            | 1668 |
| 50.6.3 | System Memory Base Address High Register (FR_SYMBADHR).....            | 1670 |
| 50.6.4 | System Memory Base Address Low Register (FR_SYMBADLR).....             | 1671 |
| 50.6.5 | Strobe Signal Control Register (FR_STBSCR).....                        | 1671 |
| 50.6.6 | Message Buffer Data Size Register (FR_MBDSR).....                      | 1673 |
| 50.6.7 | Message Buffer Segment Size and Utilization Register (FR_MBSSUTR)..... | 1674 |
| 50.6.8 | PE DRAM Access Register (FR_PEDRAR).....                               | 1675 |

| Section number | Title                                                                      | Page |
|----------------|----------------------------------------------------------------------------|------|
| 50.6.9         | PE DRAM Data Register (FR_PEDRDR).....                                     | 1676 |
| 50.6.10        | Protocol Operation Control Register (FR_POCR).....                         | 1676 |
| 50.6.11        | Global Interrupt Flag and Enable Register (FR_GIFER).....                  | 1679 |
| 50.6.12        | Protocol Interrupt Flag Register 0 (FR_PIFR0).....                         | 1681 |
| 50.6.13        | Protocol Interrupt Flag Register 1 (FR_PIFR1).....                         | 1684 |
| 50.6.14        | Protocol Interrupt Enable Register 0 (FR_PIER0).....                       | 1685 |
| 50.6.15        | Protocol Interrupt Enable Register 1 (FR_PIER1).....                       | 1687 |
| 50.6.16        | CHI Error Flag Register (FR_CHIERFR).....                                  | 1689 |
| 50.6.17        | Message Buffer Interrupt Vector Register (FR_MBIVEC).....                  | 1691 |
| 50.6.18        | Channel A Status Error Counter Register (FR_CASERCR).....                  | 1692 |
| 50.6.19        | Channel B Status Error Counter Register (FR_CBSERCR).....                  | 1693 |
| 50.6.20        | Protocol Status Register 0 (FR_PSR0).....                                  | 1693 |
| 50.6.21        | Protocol Status Register 1 (FR_PSR1).....                                  | 1695 |
| 50.6.22        | Protocol Status Register 2 (FR_PSR2).....                                  | 1696 |
| 50.6.23        | Protocol Status Register 3 (FR_PSR3).....                                  | 1699 |
| 50.6.24        | Macrotick Counter Register (FR_MTCTR).....                                 | 1701 |
| 50.6.25        | Cycle Counter Register (FR_CYCTR).....                                     | 1701 |
| 50.6.26        | Slot Counter Channel A Register (FR_SLTCTAR).....                          | 1702 |
| 50.6.27        | Slot Counter Channel B Register (FR_SLTCTBR).....                          | 1702 |
| 50.6.28        | Rate Correction Value Register (FR_RTCORVR).....                           | 1703 |
| 50.6.29        | Offset Correction Value Register (FR_OFCORVR).....                         | 1703 |
| 50.6.30        | Combined Interrupt Flag Register (FR_CIFR).....                            | 1704 |
| 50.6.31        | System Memory Access Time-Out Register (FR_SYMATOR).....                   | 1705 |
| 50.6.32        | Sync Frame Counter Register (FR_SFCNTR).....                               | 1706 |
| 50.6.33        | Sync Frame Table Offset Register (FR_SFTOR).....                           | 1707 |
| 50.6.34        | Sync Frame Table Configuration, Control, Status Register (FR_SFTCCSR)..... | 1707 |
| 50.6.35        | Sync Frame ID Rejection Filter Register (FR_SFIDRFR).....                  | 1709 |
| 50.6.36        | Sync Frame ID Acceptance Filter Value Register (FR_SFIDAFVR).....          | 1710 |
| 50.6.37        | Sync Frame ID Acceptance Filter Mask Register (FR_SFIDAFMR).....           | 1710 |

| Section number | Title                                                                                | Page |
|----------------|--------------------------------------------------------------------------------------|------|
| 50.6.38        | Network Management Vector Register (FR_NMVR <sub>n</sub> ).....                      | 1711 |
| 50.6.39        | Network Management Vector Length Register (FR_NMVLR).....                            | 1712 |
| 50.6.40        | Timer Configuration and Control Register (FR_TICCR).....                             | 1712 |
| 50.6.41        | Timer 1 Cycle Set Register (FR_TI1CYSR).....                                         | 1713 |
| 50.6.42        | Timer 1 Macrotick Offset Register (FR_TI1MTOR).....                                  | 1714 |
| 50.6.43        | Timer 2 Configuration Register 0 (Absolute Timer Configuration) (FR_TI2CR0_ABS)..... | 1715 |
| 50.6.44        | Timer 2 Configuration Register 0 (Relative Timer Configuration) (FR_TI2CR0_REL)..... | 1715 |
| 50.6.45        | Timer 2 Configuration Register 1 (Absolute Timer Configuration) (FR_TI2CR1_ABS)..... | 1716 |
| 50.6.46        | Timer 2 Configuration Register 1 (Relative Timer Configuration) (FR_TI2CR1_REL)..... | 1717 |
| 50.6.47        | Slot Status Selection Register (FR_SSSR).....                                        | 1717 |
| 50.6.48        | Slot Status Counter Condition Register (FR_SSCCR).....                               | 1719 |
| 50.6.49        | Slot Status Register (FR_SSR <sub>n</sub> ).....                                     | 1721 |
| 50.6.50        | Slot Status Counter Register (FR_SSCR <sub>n</sub> ).....                            | 1722 |
| 50.6.51        | MTS A Configuration Register (FR_MTSACFR).....                                       | 1723 |
| 50.6.52        | MTS B Configuration Register (FR_MTSBCFR).....                                       | 1724 |
| 50.6.53        | Receive Shadow Buffer Index Register (FR_RSBIR).....                                 | 1725 |
| 50.6.54        | Receive FIFO Watermark and Selection Register (FR_RFWMSR).....                       | 1726 |
| 50.6.55        | Receive FIFO Start Index Register (FR_RFSIR).....                                    | 1727 |
| 50.6.56        | Receive FIFO Depth and Size Register (FR_RFDSR).....                                 | 1727 |
| 50.6.57        | Receive FIFO A Read Index Register (FR_RFARIR).....                                  | 1728 |
| 50.6.58        | Receive FIFO B Read Index Register (FR_RFBRIR).....                                  | 1728 |
| 50.6.59        | Receive FIFO Message ID Acceptance Filter Value Register (FR_RFMIDAFVR).....         | 1729 |
| 50.6.60        | Receive FIFO Message ID Acceptance Filter Mask Register (FR_RFMIDAFMR).....          | 1730 |
| 50.6.61        | Receive FIFO Frame ID Rejection Filter Value Register (FR_RFFIDRFVR).....            | 1730 |
| 50.6.62        | Receive FIFO Frame ID Rejection Filter Mask Register (FR_RFFIDRFMR).....             | 1731 |
| 50.6.63        | Receive FIFO Range Filter Configuration Register (FR_RFRFCFR).....                   | 1731 |
| 50.6.64        | Receive FIFO Range Filter Control Register (FR_RFRFCTR).....                         | 1732 |
| 50.6.65        | Last Dynamic Transmit Slot Channel A Register (FR_LDTXSLAR).....                     | 1733 |
| 50.6.66        | Last Dynamic Transmit Slot Channel B Register (FR_LDTXSLBR).....                     | 1734 |

| Section number | Title                                              | Page |
|----------------|----------------------------------------------------|------|
| 50.6.67        | Protocol Configuration Register 0 (FR_PCR0).....   | 1734 |
| 50.6.68        | Protocol Configuration Register 1 (FR_PCR1).....   | 1737 |
| 50.6.69        | Protocol Configuration Register 2 (FR_PCR2).....   | 1737 |
| 50.6.70        | Protocol Configuration Register 3 (FR_PCR3).....   | 1738 |
| 50.6.71        | Protocol Configuration Register 4 (FR_PCR4).....   | 1739 |
| 50.6.72        | Protocol Configuration Register 5 (FR_PCR5).....   | 1739 |
| 50.6.73        | Protocol Configuration Register 6 (FR_PCR6).....   | 1740 |
| 50.6.74        | Protocol Configuration Register 7 (FR_PCR7).....   | 1741 |
| 50.6.75        | Protocol Configuration Register 8 (FR_PCR8).....   | 1741 |
| 50.6.76        | Protocol Configuration Register 9 (FR_PCR9).....   | 1742 |
| 50.6.77        | Protocol Configuration Register 10 (FR_PCR10)..... | 1743 |
| 50.6.78        | Protocol Configuration Register 11 (FR_PCR11)..... | 1744 |
| 50.6.79        | Protocol Configuration Register 12 (FR_PCR12)..... | 1744 |
| 50.6.80        | Protocol Configuration Register 13 (FR_PCR13)..... | 1745 |
| 50.6.81        | Protocol Configuration Register 14 (FR_PCR14)..... | 1746 |
| 50.6.82        | Protocol Configuration Register 15 (FR_PCR15)..... | 1746 |
| 50.6.83        | Protocol Configuration Register 16 (FR_PCR16)..... | 1747 |
| 50.6.84        | Protocol Configuration Register 17 (FR_PCR17)..... | 1747 |
| 50.6.85        | Protocol Configuration Register 18 (FR_PCR18)..... | 1748 |
| 50.6.86        | Protocol Configuration Register 19 (FR_PCR19)..... | 1748 |
| 50.6.87        | Protocol Configuration Register 20 (FR_PCR20)..... | 1749 |
| 50.6.88        | Protocol Configuration Register 21 (FR_PCR21)..... | 1749 |
| 50.6.89        | Protocol Configuration Register 22 (FR_PCR22)..... | 1750 |
| 50.6.90        | Protocol Configuration Register 23 (FR_PCR23)..... | 1750 |
| 50.6.91        | Protocol Configuration Register 24 (FR_PCR24)..... | 1751 |
| 50.6.92        | Protocol Configuration Register 25 (FR_PCR25)..... | 1751 |
| 50.6.93        | Protocol Configuration Register 26 (FR_PCR26)..... | 1752 |
| 50.6.94        | Protocol Configuration Register 27 (FR_PCR27)..... | 1753 |
| 50.6.95        | Protocol Configuration Register 28 (FR_PCR28)..... | 1753 |

| Section number | Title                                                                                 | Page |
|----------------|---------------------------------------------------------------------------------------|------|
| 50.6.96        | Protocol Configuration Register 29 (FR_PCR29).....                                    | 1754 |
| 50.6.97        | Protocol Configuration Register 30 (FR_PCR30).....                                    | 1754 |
| 50.6.98        | Protocol Event Output Enable Register (FR_PEOER).....                                 | 1755 |
| 50.6.99        | Receive FIFO Start Data Offset Register (FR_RFSDOR).....                              | 1756 |
| 50.6.100       | Receive FIFO System Memory Base Address High Register (FR_RFSYMBADHR).....            | 1756 |
| 50.6.101       | Receive FIFO System Memory Base Address Low Register (FR_RFSYMBADLR).....             | 1757 |
| 50.6.102       | Receive FIFO Periodic Timer Register (FR_RFPTR).....                                  | 1757 |
| 50.6.103       | Receive FIFO Fill Level and POP Count Register (FR_RFFLPCR).....                      | 1758 |
| 50.6.104       | ECC Error Interrupt Flag and Enable Register (FR_EEIFER).....                         | 1759 |
| 50.6.105       | ECC Error Report and Injection Control Register (FR_EERICR).....                      | 1761 |
| 50.6.106       | ECC Error Report Address Register (FR_EERAR).....                                     | 1762 |
| 50.6.107       | ECC Error Report Data Register (FR_EERDR).....                                        | 1763 |
| 50.6.108       | ECC Error Report Code Register (FR_EERCR).....                                        | 1764 |
| 50.6.109       | ECC Error Injection Address Register (FR_EEIAR).....                                  | 1765 |
| 50.6.110       | ECC Error Injection Data Register (FR_EEIDR).....                                     | 1765 |
| 50.6.111       | ECC Error Injection Code Register (FR_EEICR).....                                     | 1766 |
| 50.6.112       | Message Buffer Configuration, Control, Status Register (FR_MBCCSR <sub>n</sub> )..... | 1767 |
| 50.6.113       | Message Buffer Cycle Counter Filter Register (FR_MBCCFR <sub>n</sub> ).....           | 1768 |
| 50.6.114       | Message Buffer Frame ID Register (FR_MBFIDR <sub>n</sub> ).....                       | 1770 |
| 50.6.115       | Message Buffer Index Register (FR_MBIDXR <sub>n</sub> ).....                          | 1771 |
| 50.6.116       | Message Buffer Data Field Offset Register (FR_MBDOR <sub>n</sub> ).....               | 1772 |
| 50.6.117       | LRAM ECC Error Test Register (FR_LEETR <sub>n</sub> ).....                            | 1772 |
| 50.7           | Functional Description.....                                                           | 1773 |
| 50.7.1         | Message Buffer Concept.....                                                           | 1773 |
| 50.7.2         | Physical Message Buffer.....                                                          | 1773 |
| 50.7.3         | Message Buffer Types.....                                                             | 1774 |
| 50.7.4         | FlexRay Memory Area Layout.....                                                       | 1783 |
| 50.7.5         | Physical Message Buffer Description.....                                              | 1787 |
| 50.7.6         | Individual Message Buffer Functional Description.....                                 | 1798 |

| Section number | Title                                                             | Page |
|----------------|-------------------------------------------------------------------|------|
| 50.7.7         | Individual Message Buffer Search.....                             | 1818 |
| 50.7.8         | Individual Message Buffer Reconfiguration.....                    | 1822 |
| 50.7.9         | Receive FIFOs.....                                                | 1822 |
| 50.7.10        | Channel Device Modes.....                                         | 1831 |
| 50.7.11        | External Clock Synchronization.....                               | 1833 |
| 50.7.12        | Sync Frame ID and Sync Frame Deviation Tables.....                | 1834 |
| 50.7.13        | MTS Generation.....                                               | 1838 |
| 50.7.14        | Key Slot Transmission.....                                        | 1838 |
| 50.7.15        | Sync Frame Filtering.....                                         | 1839 |
| 50.7.16        | Strobe Signal Support.....                                        | 1841 |
| 50.7.17        | Timer Support.....                                                | 1842 |
| 50.7.18        | Slot Status Monitoring.....                                       | 1844 |
| 50.7.19        | System Bus Access.....                                            | 1848 |
| 50.7.20        | Interrupt Support.....                                            | 1850 |
| 50.7.21        | Lower Bit Rate Support.....                                       | 1855 |
| 50.7.22        | PE Data Memory (PE DRAM).....                                     | 1856 |
| 50.7.23        | CHI Lookup-Table Memory (CHI LRAM).....                           | 1858 |
| 50.7.24        | Memory Content Fault Detection.....                               | 1859 |
| 50.7.25        | Memory Fault Injection.....                                       | 1864 |
| 50.8           | Application Information.....                                      | 1867 |
| 50.8.1         | Module Configuration.....                                         | 1867 |
| 50.8.2         | Initialization Sequence.....                                      | 1869 |
| 50.8.3         | Memory Fault Injection out of POC:default config.....             | 1870 |
| 50.8.4         | Shut Down Sequence.....                                           | 1871 |
| 50.8.5         | Number of Usable Message Buffers.....                             | 1871 |
| 50.8.6         | Protocol Control Command Execution.....                           | 1873 |
| 50.8.7         | Message Buffer Search On Simple Message Buffer Configuration..... | 1874 |

## Chapter 51 SENT Receiver (SRX)

| Section number | Title                                                                                | Page |
|----------------|--------------------------------------------------------------------------------------|------|
| 51.1           | Introduction.....                                                                    | 1879 |
| 51.1.1         | Features.....                                                                        | 1879 |
| 51.1.2         | Modes of operation.....                                                              | 1881 |
| 51.1.3         | Block diagram.....                                                                   | 1883 |
| 51.1.4         | Design overview.....                                                                 | 1885 |
| 51.2           | External signal description.....                                                     | 1886 |
| 51.2.1         | SENT_RX [(CH-1):0].....                                                              | 1886 |
| 51.3           | Memory map and register definition.....                                              | 1887 |
| 51.3.1         | Global Control Register (SRX_GBL_CTRL).....                                          | 1889 |
| 51.3.2         | Channel Enable Register (SRX_CHNL_EN).....                                           | 1891 |
| 51.3.3         | Global Status Register (SRX_GBL_STATUS).....                                         | 1892 |
| 51.3.4         | Fast Message Ready Status Register (SRX_FMSG_RDY).....                               | 1893 |
| 51.3.5         | Slow Serial Message Ready Status Register (SRX_SMSG_RDY).....                        | 1894 |
| 51.3.6         | Data Control Register 1 (SRX_DATA_CTRL1).....                                        | 1895 |
| 51.3.7         | Fast Message DMA Control Register (SRX_FDMA_CTRL).....                               | 1896 |
| 51.3.8         | Slow Serial Message DMA Control Register (SRX_SDMA_CTRL).....                        | 1897 |
| 51.3.9         | Fast Message Ready Interrupt Control Register (SRX_FRDY_IE).....                     | 1898 |
| 51.3.10        | Slow Serial Message Ready Interrupt Enable Register (SRX_SRDY_IE).....               | 1899 |
| 51.3.11        | DMA Fast Message Data Read Register (SRX_DMA_FMSG_DATA).....                         | 1900 |
| 51.3.12        | DMA Fast Message CRC Read Register (SRX_DMA_FMSG_CRC).....                           | 1901 |
| 51.3.13        | DMA Fast Message Time Stamp Read Register (SRX_DMA_FMSG_TS).....                     | 1901 |
| 51.3.14        | DMA Slow Serial Message Bit3 Read Register (SRX_DMA_SMSG_BIT3).....                  | 1902 |
| 51.3.15        | DMA Slow Serial Message Bit2 Read Register (SRX_DMA_SMSG_BIT2).....                  | 1903 |
| 51.3.16        | DMA Slow Serial Message Time Stamp Read Register (SRX_DMA_SMSG_TS).....              | 1904 |
| 51.3.17        | Channel 'n' Clock Control Register (n = 0 to (CH-1)) (SRX_CHn_CLK_CTRL).....         | 1904 |
| 51.3.18        | Channel 'n' Status Register (n=0 to (CH-1)) (SRX_CHn_STATUS).....                    | 1906 |
| 51.3.19        | Channel 'n' Configuration Register (n=0 to (CH-1)) (SRX_CHn_CONFIG).....             | 1909 |
| 51.3.20        | Channel 'n' Fast Message Data Read Register (n=0 to (CH-1)) (SRX_CHn_FMSG_DATA)..... | 1912 |
| 51.3.21        | Channel 'n' Fast Message CRC Read Register (n=0 to (CH-1)) (SRX_CHn_FMSG_CRC).....   | 1913 |

| Section number    | Title                                                                                      | Page |
|-------------------|--------------------------------------------------------------------------------------------|------|
| 51.3.22           | Channel 'n' Fast Message Time Stamp Read Register (n=0 to (CH-1)) (SRX_CHn_FMSG_TS).....   | 1914 |
| 51.3.23           | Channel 'n' Serial Message Read Register (Bit 3) (n=0 to (CH-1)) (SRX_CHn_SMSG_BIT3).....  | 1914 |
| 51.3.24           | Channel 'n' Serial Message Read Register (Bit 2)(n=0 to (CH-1)) (SRX_CHn_SMSG_BIT2).....   | 1915 |
| 51.3.25           | Channel 'n' Serial Message Time Stamp Read Register (n=0 to (CH-1)) (SRX_CHn_SMSG_TS)..... | 1916 |
| 51.4              | Functional description.....                                                                | 1916 |
| 51.4.1            | Initialization sequence.....                                                               | 1917 |
| 51.4.2            | DMA read logic.....                                                                        | 1917 |
| 51.4.3            | Message reading via interrupts.....                                                        | 1926 |
| 51.4.4            | Overflow behavior.....                                                                     | 1928 |
| 51.4.5            | Adjustment for variation in sensor (Tx) clock.....                                         | 1929 |
| 51.4.6            | Input programmable filter.....                                                             | 1930 |
| 51.4.7            | Receiver diagnostics.....                                                                  | 1931 |
| 51.4.8            | Time stamp logic.....                                                                      | 1936 |
| 51.4.9            | Bus Idle Diagnostic.....                                                                   | 1937 |
| 51.5              | Clocks and resets.....                                                                     | 1938 |
| 51.5.1            | Clocking strategy.....                                                                     | 1938 |
| 51.5.2            | System bus clock requirements.....                                                         | 1939 |
| 51.5.3            | High frequency receiver clock (protocol clock) requirements.....                           | 1940 |
| <b>Chapter 52</b> |                                                                                            |      |
| <b>LINFlexD</b>   |                                                                                            |      |
| 52.1              | Introduction.....                                                                          | 1941 |
| 52.1.1            | Glossary and acronyms.....                                                                 | 1941 |
| 52.1.2            | References.....                                                                            | 1942 |
| 52.2              | Main features.....                                                                         | 1944 |
| 52.2.1            | LIN mode features.....                                                                     | 1944 |
| 52.2.2            | UART mode features.....                                                                    | 1945 |
| 52.3              | Functional description.....                                                                | 1945 |
| 52.3.1            | LIN protocol.....                                                                          | 1945 |
| 52.3.2            | LINFlexD features.....                                                                     | 1948 |

| Section number | Title                                                        | Page |
|----------------|--------------------------------------------------------------|------|
| 52.3.3         | Timer.....                                                   | 1964 |
| 52.3.4         | UART mode.....                                               | 1965 |
| 52.3.5         | DMA interface.....                                           | 1971 |
| 52.4           | Memory map and register description.....                     | 1990 |
| 52.4.1         | LIN Control Register 1 (LINFlexD_LINCR1).....                | 1992 |

## Chapter 53 10/100-Mbps Ethernet MAC (ENET)

|         |                                                      |      |
|---------|------------------------------------------------------|------|
| 53.1    | Introduction.....                                    | 2041 |
| 53.2    | Overview.....                                        | 2041 |
| 53.2.1  | Features.....                                        | 2042 |
| 53.2.2  | Block diagram.....                                   | 2044 |
| 53.3    | External signal description.....                     | 2045 |
| 53.4    | Memory map/register definition.....                  | 2047 |
| 53.4.1  | Interrupt Event Register (ENET_EIR).....             | 2052 |
| 53.4.2  | Interrupt Mask Register (ENET_EIMR).....             | 2055 |
| 53.4.3  | Receive Descriptor Active Register (ENET_RDAR).....  | 2058 |
| 53.4.4  | Transmit Descriptor Active Register (ENET_TDAR)..... | 2058 |
| 53.4.5  | Ethernet Control Register (ENET_ECR).....            | 2059 |
| 53.4.6  | MII Management Frame Register (ENET_MMFR).....       | 2061 |
| 53.4.7  | MII Speed Control Register (ENET_MSCR).....          | 2062 |
| 53.4.8  | MIB Control Register (ENET_MIBC).....                | 2064 |
| 53.4.9  | Receive Control Register (ENET_RCR).....             | 2065 |
| 53.4.10 | Transmit Control Register (ENET_TCR).....            | 2068 |
| 53.4.11 | Physical Address Lower Register (ENET_PALR).....     | 2070 |
| 53.4.12 | Physical Address Upper Register (ENET_PAUR).....     | 2070 |
| 53.4.13 | Opcode/Pause Duration Register (ENET_OPD).....       | 2071 |

| Section number | Title                                                                                      | Page |
|----------------|--------------------------------------------------------------------------------------------|------|
| 53.4.14        | Descriptor Individual Upper Address Register (ENET_IAUR).....                              | 2071 |
| 53.4.15        | Descriptor Individual Lower Address Register (ENET_IALR).....                              | 2072 |
| 53.4.16        | Descriptor Group Upper Address Register (ENET_GAUR).....                                   | 2072 |
| 53.4.17        | Descriptor Group Lower Address Register (ENET_GALR).....                                   | 2073 |
| 53.4.18        | Transmit FIFO Watermark Register (ENET_TFWR).....                                          | 2073 |
| 53.4.19        | Receive Descriptor Ring Start Register (ENET_RDSR).....                                    | 2074 |
| 53.4.20        | Transmit Buffer Descriptor Ring Start Register (ENET_TDSR).....                            | 2075 |
| 53.4.21        | Maximum Receive Buffer Size Register (ENET_MRBR).....                                      | 2076 |
| 53.4.22        | Receive FIFO Section Full Threshold (ENET_RSFL).....                                       | 2077 |
| 53.4.23        | Receive FIFO Section Empty Threshold (ENET_RSEM).....                                      | 2077 |
| 53.4.24        | Receive FIFO Almost Empty Threshold (ENET_RAEM).....                                       | 2078 |
| 53.4.25        | Receive FIFO Almost Full Threshold (ENET_RAFL).....                                        | 2078 |
| 53.4.26        | Transmit FIFO Section Empty Threshold (ENET_TSEM).....                                     | 2079 |
| 53.4.27        | Transmit FIFO Almost Empty Threshold (ENET_TAEM).....                                      | 2079 |
| 53.4.28        | Transmit FIFO Almost Full Threshold (ENET_TAFL).....                                       | 2080 |
| 53.4.29        | Transmit Inter-Packet Gap (ENET_TIPG).....                                                 | 2080 |
| 53.4.30        | Frame Truncation Length (ENET_FTRL).....                                                   | 2081 |
| 53.4.31        | Transmit Accelerator Function Configuration (ENET_TACC).....                               | 2081 |
| 53.4.32        | Receive Accelerator Function Configuration (ENET_RACC).....                                | 2082 |
| 53.4.33        | Reserved Statistic Register (ENET_RMON_T_DROP).....                                        | 2083 |
| 53.4.34        | Tx Packet Count Statistic Register (ENET_RMON_T_PACKETS).....                              | 2084 |
| 53.4.35        | Tx Broadcast Packets Statistic Register (ENET_RMON_T_BC_PKT).....                          | 2084 |
| 53.4.36        | Tx Multicast Packets Statistic Register (ENET_RMON_T_MC_PKT).....                          | 2085 |
| 53.4.37        | Tx Packets with CRC/Align Error Statistic Register (ENET_RMON_T_CRC_ALIGN).....            | 2085 |
| 53.4.38        | Tx Packets Less Than Bytes and Good CRC Statistic Register (ENET_RMON_T_UNDERSIZE).....    | 2086 |
| 53.4.39        | Tx Packets GT MAX_FL bytes and Good CRC Statistic Register (ENET_RMON_T_OVERSIZE).....     | 2086 |
| 53.4.40        | Tx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENET_RMON_T_FRAG).....       | 2087 |
| 53.4.41        | Tx Packets Greater Than MAX_FL bytes and Bad CRC Statistic Register (ENET_RMON_T_JAB)..... | 2087 |
| 53.4.42        | Tx Collision Count Statistic Register (ENET_RMON_T_COL).....                               | 2088 |

| Section number | Title                                                                                              | Page |
|----------------|----------------------------------------------------------------------------------------------------|------|
| 53.4.43        | Tx 64-Byte Packets Statistic Register (ENET_RMON_T_P64).....                                       | 2088 |
| 53.4.44        | Tx 65- to 127-byte Packets Statistic Register (ENET_RMON_T_P65TO127).....                          | 2089 |
| 53.4.45        | Tx 128- to 255-byte Packets Statistic Register (ENET_RMON_T_P128TO255).....                        | 2089 |
| 53.4.46        | Tx 256- to 511-byte Packets Statistic Register (ENET_RMON_T_P256TO511).....                        | 2090 |
| 53.4.47        | Tx 512- to 1023-byte Packets Statistic Register (ENET_RMON_T_P512TO1023).....                      | 2090 |
| 53.4.48        | Tx 1024- to 2047-byte Packets Statistic Register (ENET_RMON_T_P1024TO2047).....                    | 2091 |
| 53.4.49        | Tx Packets Greater Than 2048 Bytes Statistic Register (ENET_RMON_T_P_GTE2048).....                 | 2091 |
| 53.4.50        | Tx Octets Statistic Register (ENET_RMON_T_OCTETS).....                                             | 2092 |
| 53.4.51        | IEEE_T_DROP Reserved Statistic Register (ENET_IEEE_T_DROP).....                                    | 2092 |
| 53.4.52        | Frames Transmitted OK Statistic Register (ENET_IEEE_T_FRAME_OK).....                               | 2092 |
| 53.4.53        | Frames Transmitted with Single Collision Statistic Register (ENET_IEEE_T_1COL).....                | 2093 |
| 53.4.54        | Frames Transmitted with Multiple Collisions Statistic Register (ENET_IEEE_T_MCOL).....             | 2093 |
| 53.4.55        | Frames Transmitted after Deferral Delay Statistic Register (ENET_IEEE_T_DEF).....                  | 2094 |
| 53.4.56        | Frames Transmitted with Late Collision Statistic Register (ENET_IEEE_T_LCOL).....                  | 2094 |
| 53.4.57        | Frames Transmitted with Excessive Collisions Statistic Register (ENET_IEEE_T_EXCOL).....           | 2095 |
| 53.4.58        | Frames Transmitted with Tx FIFO Underrun Statistic Register (ENET_IEEE_T_MACERR).....              | 2095 |
| 53.4.59        | Frames Transmitted with Carrier Sense Error Statistic Register (ENET_IEEE_T_CSERR).....            | 2096 |
| 53.4.60        | ENET_IEEE_T_SQE.....                                                                               | 2096 |
| 53.4.61        | Flow Control Pause Frames Transmitted Statistic Register (ENET_IEEE_T_FDXFC).....                  | 2097 |
| 53.4.62        | Octet Count for Frames Transmitted w/o Error Statistic Register (ENET_IEEE_T_OCTETS_OK).....       | 2097 |
| 53.4.63        | Rx Packet Count Statistic Register (ENET_RMON_R_PACKETS).....                                      | 2098 |
| 53.4.64        | Rx Broadcast Packets Statistic Register (ENET_RMON_R_BC_PKT).....                                  | 2098 |
| 53.4.65        | Rx Multicast Packets Statistic Register (ENET_RMON_R_MC_PKT).....                                  | 2099 |
| 53.4.66        | Rx Packets with CRC/Align Error Statistic Register (ENET_RMON_R_CRC_ALIGN).....                    | 2099 |
| 53.4.67        | Rx Packets with Less Than 64 Bytes and Good CRC Statistic Register<br>(ENET_RMON_R_UNDERSIZE)..... | 2100 |
| 53.4.68        | Rx Packets Greater Than MAX_FL and Good CRC Statistic Register (ENET_RMON_R_OVERSIZE).2100         |      |
| 53.4.69        | Rx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENET_RMON_R_FRAG).....               | 2101 |
| 53.4.70        | Rx Packets Greater Than MAX_FL Bytes and Bad CRC Statistic Register (ENET_RMON_R_JAB).....         | 2101 |

| Section number | Title                                                                                         | Page |
|----------------|-----------------------------------------------------------------------------------------------|------|
| 53.4.71        | Reserved Statistic Register (ENET_RMON_R_RESVD_0).....                                        | 2101 |
| 53.4.72        | Rx 64-Byte Packets Statistic Register (ENET_RMON_R_P64).....                                  | 2102 |
| 53.4.73        | Rx 65- to 127-Byte Packets Statistic Register (ENET_RMON_R_P65TO127).....                     | 2102 |
| 53.4.74        | Rx 128- to 255-Byte Packets Statistic Register (ENET_RMON_R_P128TO255).....                   | 2103 |
| 53.4.75        | Rx 256- to 511-Byte Packets Statistic Register (ENET_RMON_R_P256TO511).....                   | 2103 |
| 53.4.76        | Rx 512- to 1023-Byte Packets Statistic Register (ENET_RMON_R_P512TO1023).....                 | 2104 |
| 53.4.77        | Rx 1024- to 2047-Byte Packets Statistic Register (ENET_RMON_R_P1024TO2047).....               | 2104 |
| 53.4.78        | Rx Packets Greater than 2048 Bytes Statistic Register (ENET_RMON_R_P_GTE2048).....            | 2105 |
| 53.4.79        | Rx Octets Statistic Register (ENET_RMON_R_OCTETS).....                                        | 2105 |
| 53.4.80        | Frames not Counted Correctly Statistic Register (ENET_IEEE_R_DROP).....                       | 2106 |
| 53.4.81        | Frames Received OK Statistic Register (ENET_IEEE_R_FRAME_OK).....                             | 2106 |
| 53.4.82        | Frames Received with CRC Error Statistic Register (ENET_IEEE_R_CRC).....                      | 2107 |
| 53.4.83        | Frames Received with Alignment Error Statistic Register (ENET_IEEE_R_ALIGN).....              | 2107 |
| 53.4.84        | Receive FIFO Overflow Count Statistic Register (ENET_IEEE_R_MACERR).....                      | 2108 |
| 53.4.85        | Flow Control Pause Frames Received Statistic Register (ENET_IEEE_R_FDXFC).....                | 2108 |
| 53.4.86        | Octet Count for Frames Received without Error Statistic Register (ENET_IEEE_R_OCTETS_OK)..... | 2109 |
| 53.4.87        | Adjustable Timer Control Register (ENET_ATCR).....                                            | 2109 |
| 53.4.88        | Timer Value Register (ENET_ATVR).....                                                         | 2111 |
| 53.4.89        | Timer Offset Register (ENET_ATOFF).....                                                       | 2111 |
| 53.4.90        | Timer Period Register (ENET_ATPER).....                                                       | 2112 |
| 53.4.91        | Timer Correction Register (ENET_ATCOR).....                                                   | 2112 |
| 53.4.92        | Time-Stamping Clock Period Register (ENET_ATINC).....                                         | 2113 |
| 53.4.93        | Timestamp of Last Transmitted Frame (ENET_ATSTMP).....                                        | 2113 |
| 53.4.94        | Timer Global Status Register (ENET_TGSR).....                                                 | 2114 |
| 53.4.95        | Timer Control Status Register (ENET_TCSR <sub>n</sub> ).....                                  | 2115 |
| 53.4.96        | Timer Compare Capture Register (ENET_TCCR <sub>n</sub> ).....                                 | 2116 |
| 53.5           | Functional description.....                                                                   | 2116 |
| 53.5.1         | Ethernet MAC frame formats.....                                                               | 2117 |
| 53.5.2         | IP and higher layers frame format.....                                                        | 2119 |

| Section number | Title                                   | Page |
|----------------|-----------------------------------------|------|
| 53.5.3         | IEEE 1588 message formats.....          | 2124 |
| 53.5.4         | MAC receive.....                        | 2127 |
| 53.5.5         | MAC transmit.....                       | 2133 |
| 53.5.6         | Full-duplex flow control operation..... | 2137 |
| 53.5.7         | Magic packet detection.....             | 2139 |
| 53.5.8         | IP accelerator functions.....           | 2140 |
| 53.5.9         | Resets and stop controls.....           | 2144 |
| 53.5.10        | IEEE 1588 functions.....                | 2147 |
| 53.5.11        | FIFO thresholds.....                    | 2151 |
| 53.5.12        | Loopback options.....                   | 2154 |
| 53.5.13        | Legacy buffer descriptors.....          | 2155 |
| 53.5.14        | Enhanced buffer descriptors.....        | 2156 |
| 53.5.15        | Client FIFO application interface.....  | 2162 |
| 53.5.16        | FIFO protection.....                    | 2165 |
| 53.5.17        | Reference clock.....                    | 2167 |
| 53.5.18        | PHY management interface.....           | 2168 |
| 53.5.19        | Ethernet interfaces.....                | 2171 |

## Chapter 54

### Reset Generation Module (MC\_RGM)

|        |                                                                      |      |
|--------|----------------------------------------------------------------------|------|
| 54.1   | Introduction.....                                                    | 2177 |
| 54.1.1 | Overview.....                                                        | 2177 |
| 54.1.2 | Features.....                                                        | 2178 |
| 54.1.3 | Reset Sources.....                                                   | 2179 |
| 54.2   | External Signal Description.....                                     | 2180 |
| 54.3   | Memory Map and Register Definition.....                              | 2180 |
| 54.3.1 | 'Destructive' Event Status Register (MC_RGM_DES).....                | 2181 |
| 54.3.2 | 'Destructive' Event Reset Disable Register (MC_RGM_DERD).....        | 2183 |
| 54.3.3 | 'Destructive' Bidirectional Reset Enable Register (MC_RGM_DBRE)..... | 2185 |
| 54.3.4 | 'Functional' Event Status Register (MC_RGM_FES).....                 | 2187 |

| Section number | Title                                                                | Page |
|----------------|----------------------------------------------------------------------|------|
| 54.3.5         | 'Functional' Event Reset Disable Register (MC_RGM_FERD).....         | 2189 |
| 54.3.6         | 'Functional' Event Alternate Request Register (MC_RGM_FEAR).....     | 2191 |
| 54.3.7         | 'Functional' Bidirectional Reset Enable Register (MC_RGM_FBRE).....  | 2192 |
| 54.3.8         | 'Functional' Event Short Sequence Register (MC_RGM_FESS).....        | 2194 |
| 54.3.9         | 'Functional' Reset Escalation Threshold Register (MC_RGM_FRET).....  | 2196 |
| 54.3.10        | 'Destructive' Reset Escalation Threshold Register (MC_RGM_DRET)..... | 2197 |
| 54.4           | Functional Description.....                                          | 2198 |
| 54.4.1         | Reset State Machine.....                                             | 2198 |
| 54.4.2         | 'Destructive' Resets.....                                            | 2201 |
| 54.4.3         | External Reset.....                                                  | 2201 |
| 54.4.4         | 'Functional' Resets.....                                             | 2202 |
| 54.4.5         | Alternate Event Generation.....                                      | 2203 |
| 54.4.6         | 'Functional' Reset Escalation.....                                   | 2204 |
| 54.4.7         | 'Destructive' Reset Escalation.....                                  | 2204 |
| 54.4.8         | Boot Mode Capturing.....                                             | 2205 |

## Chapter 55 Boot Assist Module (BAM)

|        |                               |      |
|--------|-------------------------------|------|
| 55.1   | Overview.....                 | 2207 |
| 55.2   | Features.....                 | 2207 |
| 55.3   | Memory map.....               | 2207 |
| 55.4   | Functional description.....   | 2208 |
| 55.4.1 | Entering boot modes.....      | 2208 |
| 55.4.2 | Boot through BAM.....         | 2209 |
| 55.4.3 | UART Boot .....               | 2214 |
| 55.4.4 | CAN Boot .....                | 2215 |
| 55.4.5 | Inhibiting BAM operation..... | 2217 |
| 55.4.6 | Interrupts.....               | 2217 |

## Chapter 56 System Status and Configuration Module (SSCM)

| Section number | Title                                                    | Page |
|----------------|----------------------------------------------------------|------|
| 56.1           | Introduction.....                                        | 2219 |
| 56.1.1         | Overview.....                                            | 2219 |
| 56.1.2         | Glossary.....                                            | 2220 |
| 56.1.3         | Features.....                                            | 2220 |
| 56.1.4         | Modes of operation.....                                  | 2220 |
| 56.2           | External signal description.....                         | 2221 |
| 56.3           | Memory map and register definition.....                  | 2221 |
| 56.3.1         | SSCM System Status (SSCM_STATUS).....                    | 2222 |
| 56.3.2         | SSCM System Memory and ID Register (SSCM_MEMCONFIG)..... | 2224 |
| 56.3.3         | SSCM Error Configuration Register (SSCM_ERROR).....      | 2225 |
| 56.3.4         | SSCM Debug Status Port Register (SSCM_DEBUGPORT).....    | 2225 |
| 56.3.5         | User Option Status Register (SSCM_UOPS).....             | 2227 |
| 56.3.6         | Processor Start Address Register (SSCM_PSA).....         | 2227 |
| 56.4           | Functional description.....                              | 2228 |
| 56.4.1         | DCF mechanism.....                                       | 2228 |
| 56.4.2         | CERS-DCF Mechanism.....                                  | 2230 |
| 56.4.3         | Boot mode functionality.....                             | 2231 |
| 56.4.4         | Hardware configuration.....                              | 2231 |
| 56.4.5         | Single Chip boot sector search.....                      | 2232 |
| 56.4.6         | Serial boot loader mode.....                             | 2234 |
| 56.4.7         | Security.....                                            | 2235 |
| 56.4.8         | Serial access security.....                              | 2238 |
| 56.5           | Initialization and application information.....          | 2238 |
| 56.5.1         | Reset.....                                               | 2238 |
| 56.6           | Additional safety measures.....                          | 2239 |
| 56.6.1         | Spurious reset protection.....                           | 2239 |

## Chapter 57 Power Management Controller block (PMC)

|      |                   |      |
|------|-------------------|------|
| 57.1 | Introduction..... | 2241 |
|------|-------------------|------|

| Section number | Title                                                         | Page |
|----------------|---------------------------------------------------------------|------|
| 57.1.1         | PMC Introduction.....                                         | 2241 |
| 57.1.2         | Features.....                                                 | 2242 |
| 57.2           | Memory Map and Registers.....                                 | 2243 |
| 57.2.1         | PMC Status Register (PMC_PMCSR).....                          | 2244 |
| 57.2.2         | Regulator Voltage Status Register (PMC_RSSR).....             | 2245 |
| 57.2.3         | PMC Control Register (PMC_PMCCR).....                         | 2248 |
| 57.2.4         | Interrupt Enable Register (PMC_IER).....                      | 2249 |
| 57.2.5         | Event Status Register 0 (PMC_ESR_0).....                      | 2253 |
| 57.2.6         | Reset Event Enable 0 (PMC_REE_0).....                         | 2255 |
| 57.2.7         | Reset Event Selection 0 (PMC_RES_0).....                      | 2257 |
| 57.2.8         | FCCU Fault Injection Register (PMC_FIR).....                  | 2260 |
| 57.2.9         | Temperature Event Status register (PMC_ESR_TD).....           | 2262 |
| 57.2.10        | Temperature Reset Event Enable register (PMC_REE_TD).....     | 2265 |
| 57.2.11        | Temperature Reset Event Selection register (PMC_RES_TD).....  | 2267 |
| 57.2.12        | Temperature detector configuration register (PMC_CTL_TD)..... | 2269 |
| 57.2.13        | LVD Self Test Time Window Register (PMC_STTW).....            | 2271 |
| 57.2.14        | Voltage Detect User Mode Test Register (PMC_VD_UTST).....     | 2272 |
| 57.3           | Analog PMC interface.....                                     | 2274 |
| 57.4           | Temperature Sensor Interface Logic.....                       | 2274 |
| 57.5           | Power On Reset (MC_RGM Phase Gates).....                      | 2274 |
| 57.6           | Flash interface (DCF).....                                    | 2274 |
| 57.7           | FCCU Interface.....                                           | 2275 |
| 57.8           | LVD/HVD self test mechanism.....                              | 2278 |
| 57.8.1         | Default Mode.....                                             | 2278 |
| 57.8.2         | Software triggered self test.....                             | 2278 |
| 57.8.3         | Single VD test.....                                           | 2279 |

## Chapter 58 Power Control Unit (MC\_PCU)

|      |                   |      |
|------|-------------------|------|
| 58.1 | Introduction..... | 2281 |
|------|-------------------|------|

| Section number | Title                                                       | Page |
|----------------|-------------------------------------------------------------|------|
| 58.1.1         | Overview.....                                               | 2281 |
| 58.1.2         | Features.....                                               | 2282 |
| 58.2           | External Signal Description.....                            | 2282 |
| 58.3           | Memory Map and Register Definition.....                     | 2283 |
| 58.3.1         | Power Domain #0 Configuration Register (MC_PCU_PCONF0)..... | 2284 |
| 58.3.2         | Power Domain Status Register (MC_PCU_PSTAT).....            | 2286 |

## Chapter 59 Mode Entry Module (MC\_ME)

|         |                                                           |      |
|---------|-----------------------------------------------------------|------|
| 59.1    | Introduction.....                                         | 2287 |
| 59.1.1  | Overview.....                                             | 2287 |
| 59.1.2  | Features.....                                             | 2289 |
| 59.1.3  | Modes of Operation.....                                   | 2289 |
| 59.2    | External Signal Description.....                          | 2290 |
| 59.3    | Memory Map and Register Definition.....                   | 2290 |
| 59.3.1  | Global Status Register (MC_ME_GS).....                    | 2295 |
| 59.3.2  | Mode Control Register (MC_ME_MCTL).....                   | 2297 |
| 59.3.3  | Mode Enable Register (MC_ME_ME).....                      | 2299 |
| 59.3.4  | Interrupt Status Register (MC_ME_IS).....                 | 2301 |
| 59.3.5  | Interrupt Mask Register (MC_ME_IM).....                   | 2302 |
| 59.3.6  | Invalid Mode Transition Status Register (MC_ME_IMTS)..... | 2304 |
| 59.3.7  | Debug Mode Transition Status Register (MC_ME_DMTS).....   | 2306 |
| 59.3.8  | RESET Mode Configuration Register (MC_ME_RESET_MC).....   | 2310 |
| 59.3.9  | TEST Mode Configuration Register (MC_ME_TEST_MC).....     | 2313 |
| 59.3.10 | SAFE Mode Configuration Register (MC_ME_SAFE_MC).....     | 2315 |
| 59.3.11 | DRUN Mode Configuration Register (MC_ME_DRUN_MC).....     | 2317 |
| 59.3.12 | RUN0 Mode Configuration Register (MC_ME_RUN0_MC).....     | 2320 |
| 59.3.13 | RUN1 Mode Configuration Register (MC_ME_RUN1_MC).....     | 2322 |
| 59.3.14 | RUN2 Mode Configuration Register (MC_ME_RUN2_MC).....     | 2324 |
| 59.3.15 | RUN3 Mode Configuration Register (MC_ME_RUN3_MC).....     | 2327 |

| Section number | Title                                                           | Page |
|----------------|-----------------------------------------------------------------|------|
| 59.3.16        | HALT0 Mode Configuration Register (MC_ME_HALT0_MC).....         | 2329 |
| 59.3.17        | STOP0 Mode Configuration Register (MC_ME_STOP0_MC).....         | 2331 |
| 59.3.18        | Peripheral Status Register 0 (MC_ME_PS0).....                   | 2334 |
| 59.3.19        | Peripheral Status Register 1 (MC_ME_PS1).....                   | 2336 |
| 59.3.20        | Peripheral Status Register 2 (MC_ME_PS2).....                   | 2338 |
| 59.3.21        | Peripheral Status Register 3 (MC_ME_PS3).....                   | 2340 |
| 59.3.22        | Peripheral Status Register 4 (MC_ME_PS4).....                   | 2342 |
| 59.3.23        | Peripheral Status Register 6 (MC_ME_PS6).....                   | 2344 |
| 59.3.24        | Peripheral Status Register 7 (MC_ME_PS7).....                   | 2346 |
| 59.3.25        | Run Peripheral Configuration Register (MC_ME_RUN_PCn).....      | 2348 |
| 59.3.26        | Low-Power Peripheral Configuration Register (MC_ME_LP_PCn)..... | 2350 |
| 59.3.27        | LFAST_0 Peripheral Control Register (MC_ME_PCTL9).....          | 2351 |
| 59.3.28        | SIPI_0 Peripheral Control Register (MC_ME_PCTL11).....          | 2352 |
| 59.3.29        | ENET_0 Peripheral Control Register (MC_ME_PCTL12).....          | 2353 |
| 59.3.30        | PIT_0 Peripheral Control Register (MC_ME_PCTL30).....           | 2354 |
| 59.3.31        | DMAMUX_0 Peripheral Control Register (MC_ME_PCTL36).....        | 2355 |
| 59.3.32        | CRC_0 Peripheral Control Register (MC_ME_PCTL38).....           | 2356 |
| 59.3.33        | CAN_2 Peripheral Control Register (MC_ME_PCTL77).....           | 2357 |
| 59.3.34        | CAN_1 Peripheral Control Register (MC_ME_PCTL78).....           | 2358 |
| 59.3.35        | CAN_0 Peripheral Control Register (MC_ME_PCTL79).....           | 2359 |
| 59.3.36        | LINFlex_1 Peripheral Control Register (MC_ME_PCTL91).....       | 2360 |
| 59.3.37        | DSPI_1 Peripheral Control Register (MC_ME_PCTL98).....          | 2361 |
| 59.3.38        | DSPI_0 Peripheral Control Register (MC_ME_PCTL99).....          | 2362 |
| 59.3.39        | SENT_0 Peripheral Control Register (MC_ME_PCTL104).....         | 2363 |
| 59.3.40        | FLEXRAY Peripheral Control Register (MC_ME_PCTL107).....        | 2364 |
| 59.3.41        | ADC_3 Peripheral Control Register (MC_ME_PCTL124).....          | 2365 |
| 59.3.42        | ADC_1 Peripheral Control Register (MC_ME_PCTL126).....          | 2366 |
| 59.3.43        | ETIMER_1 Peripheral Control Register (MC_ME_PCTL137).....       | 2367 |
| 59.3.44        | CTU_1 Peripheral Control Register (MC_ME_PCTL141).....          | 2368 |

| Section number | Title                                                      | Page |
|----------------|------------------------------------------------------------|------|
| 59.3.45        | PWM_1 Peripheral Control Register (MC_ME_PCTL144).....     | 2369 |
| 59.3.46        | DMAMUX_1 Peripheral Control Register (MC_ME_PCTL146).....  | 2370 |
| 59.3.47        | LINFlex_0 Peripheral Control Register (MC_ME_PCTL204)..... | 2371 |
| 59.3.48        | DSPI_3 Peripheral Control Register (MC_ME_PCTL208).....    | 2372 |
| 59.3.49        | DSPI_2 Peripheral Control Register (MC_ME_PCTL209).....    | 2373 |
| 59.3.50        | SENT_1 Peripheral Control Register (MC_ME_PCTL214).....    | 2374 |
| 59.3.51        | ADC_2 Peripheral Control Register (MC_ME_PCTL235).....     | 2375 |
| 59.3.52        | ADC_0 Peripheral Control Register (MC_ME_PCTL237).....     | 2376 |
| 59.3.53        | SGEN_0 Peripheral Control Register (MC_ME_PCTL239).....    | 2377 |
| 59.3.54        | ETIMER_2 Peripheral Control Register (MC_ME_PCTL245).....  | 2378 |
| 59.3.55        | ETIMER_0 Peripheral Control Register (MC_ME_PCTL247).....  | 2379 |
| 59.3.56        | CTU_0 Peripheral Control Register (MC_ME_PCTL251).....     | 2380 |
| 59.3.57        | PWM_0 Peripheral Control Register (MC_ME_PCTL255).....     | 2381 |
| 59.3.58        | Core Status Register (MC_ME_CS).....                       | 2382 |
| 59.3.59        | Core Control Register (MC_ME_CCTL0).....                   | 2383 |
| 59.3.60        | CORE0 Address Register (MC_ME_CADDR0).....                 | 2384 |
| 59.4           | Functional Description.....                                | 2385 |
| 59.4.1         | Mode Transition Request.....                               | 2385 |
| 59.4.2         | Modes Details.....                                         | 2386 |
| 59.4.3         | Mode Transition Process.....                               | 2393 |
| 59.4.4         | Protection of Mode Configuration Registers.....            | 2403 |
| 59.4.5         | Mode transition and progressive clock switching.....       | 2404 |
| 59.4.6         | Mode Transition Interrupts.....                            | 2405 |
| 59.4.7         | Peripheral Clock Gating.....                               | 2408 |
| 59.4.8         | Application Example.....                                   | 2409 |

## Chapter 60 Core Debug Support

|        |                                |      |
|--------|--------------------------------|------|
| 60.1   | Overview.....                  | 2411 |
| 60.1.1 | Software Debug Facilities..... | 2411 |

| Section number | Title                                                                   | Page |
|----------------|-------------------------------------------------------------------------|------|
| 60.1.2         | Additional Debug Facilities.....                                        | 2412 |
| 60.1.3         | Hardware Debug Facilities.....                                          | 2413 |
| 60.1.4         | Sharing Debug Resources by Software/Hardware.....                       | 2414 |
| 60.2           | Software Debug Events and Exceptions.....                               | 2415 |
| 60.2.1         | Instruction Address Compare Event.....                                  | 2417 |
| 60.2.2         | Data Address Compare Event.....                                         | 2417 |
| 60.2.3         | Linked Instruction Address Compare and Data Address Compare Events..... | 2426 |
| 60.2.4         | Trap Debug Event.....                                                   | 2427 |
| 60.2.5         | Branch Taken Debug Event.....                                           | 2427 |
| 60.2.6         | Instruction Complete Debug Event.....                                   | 2428 |
| 60.2.7         | Interrupt Taken Debug Event.....                                        | 2428 |
| 60.2.8         | Critical Interrupt Taken Debug Event.....                               | 2429 |
| 60.2.9         | Return Debug Event.....                                                 | 2429 |
| 60.2.10        | Critical Return Debug Event.....                                        | 2429 |
| 60.2.11        | External debug event.....                                               | 2430 |
| 60.2.12        | Unconditional debug event.....                                          | 2430 |
| 60.2.13        | Performance Monitor Interrupt debug event.....                          | 2430 |
| 60.3           | Debug registers.....                                                    | 2431 |
| 60.3.1         | Debug Address and Value Registers.....                                  | 2431 |
| 60.3.2         | Debug Control and Status registers.....                                 | 2432 |
| 60.3.3         | External Debug Resource Allocation Control Register (EDBRAC0).....      | 2455 |
| 60.3.4         | Debug Event Select Register (DEVENT).....                               | 2462 |
| 60.3.5         | Debug Data Acquisition Message Register (DDAM).....                     | 2464 |
| 60.4           | Using Debug Resources for Stack Limit Checking.....                     | 2465 |
| 60.5           | External Debug Support.....                                             | 2467 |
| 60.5.1         | External Debug Registers.....                                           | 2469 |
| 60.5.2         | OnCE Introduction.....                                                  | 2475 |
| 60.5.3         | JTAG/OnCE Pins.....                                                     | 2478 |
| 60.5.4         | OnCE Internal Interface Signals.....                                    | 2478 |

| Section number | Title                                                                 | Page |
|----------------|-----------------------------------------------------------------------|------|
| 60.5.5         | OnCE Interface Signals.....                                           | 2479 |
| 60.5.6         | OnCE Controller and serial interface.....                             | 2482 |
| 60.5.7         | Access to Debug Resources.....                                        | 2489 |
| 60.5.8         | Methods of Entering Debug Mode.....                                   | 2491 |
| 60.5.9         | CPU Status and Control Scan Chain Register (CPUSCR).....              | 2493 |
| 60.5.10        | Reserved Registers (Reserved).....                                    | 2500 |
| 60.6           | Watchpoint Support.....                                               | 2500 |
| 60.7           | MPU Operation During Debug.....                                       | 2503 |
| 60.8           | Cache Array Access During Debug.....                                  | 2504 |
| 60.9           | Basic Steps for Enabling, Using, and Exiting External Debug Mode..... | 2504 |

## Chapter 61 JTAG Controller (JTAGC)

|        |                                     |      |
|--------|-------------------------------------|------|
| 61.1   | Introduction.....                   | 2507 |
| 61.1.1 | Block diagram.....                  | 2507 |
| 61.1.2 | Features.....                       | 2508 |
| 61.1.3 | Modes of operation.....             | 2509 |
| 61.2   | External signal description.....    | 2510 |
| 61.2.1 | TCK—Test clock input.....           | 2510 |
| 61.2.2 | TDI—Test data input.....            | 2510 |
| 61.2.3 | TDO—Test data output.....           | 2510 |
| 61.2.4 | TMS—Test mode select.....           | 2511 |
| 61.2.5 | JCOMP—JTAG compliancy.....          | 2511 |
| 61.3   | Register description.....           | 2511 |
| 61.3.1 | Instruction register.....           | 2511 |
| 61.3.2 | Bypass register.....                | 2512 |
| 61.3.3 | Device identification register..... | 2512 |
| 61.3.4 | TEST_CTRL Register.....             | 2513 |
| 61.3.5 | JTAG_PASSWORD register.....         | 2513 |
| 61.3.6 | Boundary scan register.....         | 2514 |

| Section number | Title                                         | Page |
|----------------|-----------------------------------------------|------|
| 61.4           | Functional description.....                   | 2514 |
| 61.4.1         | JTAGC reset configuration.....                | 2514 |
| 61.4.2         | IEEE 1149.1-2001 (JTAG) Test Access Port..... | 2514 |
| 61.4.3         | TAP controller state machine.....             | 2515 |
| 61.4.4         | JTAGC block instructions.....                 | 2517 |
| 61.4.5         | Boundary scan.....                            | 2520 |
| 61.5           | Initialization/Application information.....   | 2521 |

## Chapter 62 Nexus Module

|         |                                                                    |      |
|---------|--------------------------------------------------------------------|------|
| 62.1    | Introduction.....                                                  | 2523 |
| 62.1.1  | General description.....                                           | 2523 |
| 62.1.2  | Terms and definitions.....                                         | 2523 |
| 62.1.3  | Feature list.....                                                  | 2524 |
| 62.1.4  | Functional block diagram.....                                      | 2526 |
| 62.2    | Enabling Nexus 3 operation.....                                    | 2527 |

| 62.20          | Examples.....                                                  | 2604 |
| 62.21          | Electrical characteristics.....                                | 2606 |
| 62.22          | IEEE 1149.1 (JTAG) RD/WR sequences.....                        | 2607 |
| 62.22.1        | JTAG sequence for accessing internal Nexus registers.....      | 2607 |
| 62.22.2        | JTAG sequence for read access of memory-mapped resources.....  | 2607 |
| 62.22.3        | JTAG sequence for write access of memory-mapped resources..... | 2608 |

## Chapter 63

### Nexus Crossbar Multi-Master Client (NXMC)

|         |                                                                      |      |
|---------|----------------------------------------------------------------------|------|
| 63.1    | Introduction.....                                                    | 2609 |
| 63.1.1  | Features.....                                                        | 2609 |
| 63.2    | External signal description.....                                     | 2610 |
| 63.3    | Supported messages and TCODEs.....                                   | 2611 |
| 63.4    | Register description.....                                            | 2614 |
| 63.4.1  | Development control register 1 (DC1).....                            | 2614 |
| 63.4.2  | Development control register 2 (DC2).....                            | 2615 |
| 63.4.3  | Watchpoint trigger register (WT).....                                | 2616 |
| 63.4.4  | Data trace control register (DTC).....                               | 2617 |
| 63.4.5  | Data trace start address registers 1 and 2 (DTSA1 and DTSA2).....    | 2618 |
| 63.4.6  | Data trace end address registers 1 and 2 (DTEA1 and DTEA2).....      | 2618 |
| 63.4.7  | Breakpoint/watchpoint control register 1 (BWC1).....                 | 2619 |
| 63.4.8  | Breakpoint/watchpoint control register 2 (BWC2).....                 | 2620 |
| 63.4.9  | Breakpoint/watchpoint address registers 1 and 2 (BWA1 and BWA2)..... | 2621 |
| 63.4.10 | Unimplemented registers.....                                         | 2621 |
| 63.5    | Programming considerations (RESET).....                              | 2622 |
| 63.5.1  | IEEE 1149.1 (JTAG) Test Access Port.....                             | 2622 |
| 63.5.2  | Enabling NXMC operation.....                                         | 2622 |

| Section number | Title                              | Page |
|----------------|------------------------------------|------|
| 63.5.3         | Enabling NXMC TAP controller.....  | 2622 |
| 63.5.4         | NXMC register access via JTAG..... | 2623 |
| 63.6           | Functional description.....        | 2624 |
| 63.6.1         | Data trace.....                    | 2624 |
| 63.6.2         | Watchpoint support.....            | 2630 |

## Chapter 64 Nexus Port Controller (NPC)

|        |                                              |      |
|--------|----------------------------------------------|------|
| 64.1   | Introduction.....                            | 2633 |
| 64.1.1 | Overview.....                                | 2633 |
| 64.1.2 | Features.....                                | 2634 |
| 64.1.3 | Modes of operation.....                      | 2634 |
| 64.2   | External signal description.....             | 2636 |
| 64.2.1 | Overview.....                                | 2636 |
| 64.2.2 | Detailed signal descriptions.....            | 2636 |
| 64.3   | Register definition.....                     | 2638 |
| 64.3.1 | Register descriptions.....                   | 2638 |
| 64.4   | Functional Description.....                  | 2643 |
| 64.4.1 | NPC reset configuration.....                 | 2643 |
| 64.4.2 | Auxiliary Output Port.....                   | 2644 |
| 64.4.3 | IEEE 1149.1-2001 (JTAG) TAP.....             | 2647 |
| 64.4.4 | Nexus JTAG Port Sharing.....                 | 2652 |
| 64.4.5 | MCKO Control .....                           | 2652 |
| 64.4.6 | EVTO Sharing.....                            | 2653 |
| 64.4.7 | Nexus Reset Control.....                     | 2653 |
| 64.4.8 | System Clock Locked Indication.....          | 2653 |
| 64.4.9 | Data Transmission via Nexus Aurora Link..... | 2653 |
| 64.5   | Initialization/Application Information.....  | 2654 |
| 64.5.1 | Accessing NPC tool-mapped registers.....     | 2654 |

## Chapter 65

| Section number                            | Title                                                    | Page |
|-------------------------------------------|----------------------------------------------------------|------|
| <b>Nexus Aurora Link (NAL)</b>            |                                                          |      |
| 65.1                                      | Introduction.....                                        | 2657 |
| 65.2                                      | Transmit operation.....                                  | 2658 |
| 65.3                                      | Nexus Aurora formatting.....                             | 2659 |
| 65.4                                      | Static training.....                                     | 2659 |
| 65.5                                      | Clock compensation considerations.....                   | 2660 |
| 65.6                                      | Programmable registers.....                              | 2661 |
| 65.6.1                                    | Nexus Aurora Link General Status Register (NAL_GSR)..... | 2662 |
| 65.6.2                                    | NAL General Control Register (NAL_GCR).....              | 2663 |

| 69.5.2 | FSM description.....                   | 2722 |
| 69.5.3 | Fault priority scheme and nesting..... | 2725 |
| 69.5.4 | Fault recovery.....                    | 2726 |

| Section number | Title                                                       | Page |
|----------------|-------------------------------------------------------------|------|
| 69.5.5         | NMI/WKPU interface.....                                     | 2728 |
| 69.5.6         | STCU interface.....                                         | 2729 |
| 69.5.7         | EOOUT interface.....                                        | 2730 |
| 69.5.8         | Error signal flow.....                                      | 2735 |
| 69.6           | Register descriptions.....                                  | 2736 |
| 69.6.1         | Control (FCCU_CTRL).....                                    | 2738 |
| 69.6.2         | Control Key (FCCU_CTRLK).....                               | 2741 |
| 69.6.3         | Configuration (FCCU_CFG).....                               | 2742 |
| 69.6.4         | Noncritical Fault Configuration (FCCU_NCF_CFGn).....        | 2745 |
| 69.6.5         | Noncritical Fault State Configuration (FCCU_NCFS_CFGn)..... | 2746 |
| 69.6.6         | Noncritical Fault Status (FCCU_NCF_Sn).....                 | 2747 |
| 69.6.7         | Noncritical Fault Key (FCCU_NCFK).....                      | 2749 |
| 69.6.8         | Noncritical Fault Enable (FCCU_NCF_En).....                 | 2750 |
| 69.6.9         | Noncritical Fault Timeout Enable (FCCU_NCF_TOEn).....       | 2751 |
| 69.6.10        | Noncritical Fault Timeout (FCCU_NCF_TO).....                | 2752 |
| 69.6.11        | Configuration-State Timeout (FCCU_CFG_TO).....              | 2752 |
| 69.6.12        | IO Control (FCCU_EINOUT).....                               | 2753 |
| 69.6.13        | Status (FCCU_STAT).....                                     | 2755 |
| 69.6.14        | NA Freeze Status (FCCU_N2AF_STATUS).....                    | 2757 |
| 69.6.15        | AF Freeze Status (FCCU_A2FF_STATUS).....                    | 2758 |
| 69.6.16        | NF Freeze Status (FCCU_N2FF_STATUS).....                    | 2759 |
| 69.6.17        | FA Freeze Status (FCCU_F2A_STATUS).....                     | 2760 |
| 69.6.18        | Noncritical Fault Fake (FCCU_NCFF).....                     | 2761 |
| 69.6.19        | IRQ Status (FCCU_IRQ_STAT).....                             | 2762 |
| 69.6.20        | IRQ Enable (FCCU_IRQ_EN).....                               | 2763 |
| 69.6.21        | XTMR (FCCU_XTMR).....                                       | 2764 |
| 69.6.22        | Mode Controller Status (FCCU_MCS).....                      | 2765 |
| 69.6.23        | Transient Lock (FCCU_TRANS_LOCK).....                       | 2767 |
| 69.6.24        | Permanent Lock (FCCU_PERMNT_LOCK).....                      | 2768 |

| Section number | Title                                                         | Page |
|----------------|---------------------------------------------------------------|------|
| 69.6.25        | Delta T (FCCU_DELTA_T).....                                   | 2768 |
| 69.6.26        | IRQ Alarm Enable (FCCU_IRQ_ALARM_ENn).....                    | 2769 |
| 69.6.27        | NMI Enable (FCCU_NMI_ENn).....                                | 2770 |
| 69.6.28        | Fault-Output (EOUT) Signaling Enable (FCCU_EOUT_SIG_ENn)..... | 2771 |
| 69.7           | FCCU Output Supervision Unit.....                             | 2772 |
| 69.8           | Use cases and limitations.....                                | 2774 |
| 69.8.1         | Misconfigurations.....                                        | 2774 |
| 69.8.2         | Recommendations to configure FCCU.....                        | 2775 |

## Chapter 70 Self-Test Control Unit (STCU2)

|         |                                                                           |      |
|---------|---------------------------------------------------------------------------|------|
| 70.1    | Introduction .....                                                        | 2777 |
| 70.2    | Functional description.....                                               | 2778 |

| 72.5.1 | Non-maskable interrupts.....                 | 2839 |

# Chapter 1

## Preface

### 1.1 Overview

The primary objective of this document is to define the functionality of the MPC5744P microcontroller for use by software and hardware developers. The MPC5744P Qorivva microcontroller is based on the Power Architecture® developed by Freescale. The MPC5744P is a SafeAssure solution.

As with any technical documentation, it is the reader's responsibility to ensure he or she is using the most recent version of this document.

To locate any published errata or updates for this document, visit the Freescale Web site at <http://www.freescale.com>.

### 1.2 Device versions

This release of this document describes the functionality and programming model of the device intended for production.

The device has these part numbers: MPC5744P, MPC5743P, MPC5742P, and MPC5741P. The parts differ with regard to flash memory and system RAM sizes. This document uses MPC5744P as the generic part number.

### 1.3 Audience

This manual is intended for system software and hardware developers and applications programmers who want to develop products with the MPC5744P device. It is assumed that the reader understands operating systems, microprocessor system design, basic principles of software and hardware, and basic details of the Power Architecture.

## 1.4 Document organization

This document includes two major sets of chapters:

- Chapters in the first set describe the device as a whole or device-specific information.
- Chapters in the second set describe the functionality of the individual modules on the device. These chapters are organized into the following groups:
  - Core and system modules
  - Clocking modules
  - Memories and memory interfaces
  - Motor control modules
  - Timers
  - Communication interfaces
  - Reset and boot modules
  - Power management modules
  - Debug
  - Safety modules
  - Other modules

## 1.5 Conventions

### 1.5.1 Numbering systems

The following suffixes identify different numbering systems:

| This suffix | Identifies a                                                                                                                                                          |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| b           | Binary number. For example, the binary equivalent of the number 5 is written 101b. In some cases, binary numbers are shown with the prefix <i>0b</i> .                |
| d           | Decimal number. Decimal numbers are followed by this suffix only when the possibility of confusion exists. In general, decimal numbers are shown without a suffix.    |
| h           | Hexadecimal number. For example, the hexadecimal equivalent of the number 60 is written 3Ch. In some cases, hexadecimal numbers are shown with the prefix <i>0x</i> . |

### 1.5.2 Typographic notation

The following typographic notation is used throughout this document:

| Example               | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>placeholder, x</i> | Items in italics are placeholders for information that you provide. Italicized text is also used for the titles of publications and for emphasis. Plain lowercase letters are also used as placeholders for single letters and numbers.                                                                                                                                                                              |
| code                  | Fixed-width type indicates text that must be typed exactly as shown. It is used for instruction mnemonics, directives, symbols, subcommands, parameters, and operators. Fixed-width type is also used for example code. Instruction mnemonics and directives in text and tables are shown in all caps; for example, BSR.                                                                                             |
| SR[SCM]               | A mnemonic in brackets represents a named field in a register. This example refers to the Scaling Mode (SCM) field in the Status Register (SR).                                                                                                                                                                                                                                                                      |
| REVNO[6:4], XAD[7:0]  | Numbers in brackets and separated by a colon represent either: <ul style="list-style-type: none"> <li>• A subset of a register's named field<br/>For example, REVNO[6:4] refers to bits 6–4 that are part of the COREREV field that occupies bits 6–0 of the REVNO register.</li> <li>• A continuous range of individual signals of a bus<br/>For example, XAD[7:0] refers to signals 7–0 of the XAD bus.</li> </ul> |

### 1.5.3 Special terms

The following terms have special meanings:

| Term       | Meaning                                                                                                                                                                                                                                                                                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| asserted   | Refers to the state of a signal as follows: <ul style="list-style-type: none"> <li>• An active-high signal is asserted when high (1).</li> <li>• An active-low signal is asserted when low (0).</li> </ul>                                                                                                                                                                                             |
| deasserted | Refers to the state of a signal as follows: <ul style="list-style-type: none"> <li>• An active-high signal is deasserted when low (0).</li> <li>• An active-low signal is deasserted when high (1).</li> </ul> <p>In some cases, deasserted signals are described as <i>negated</i>.</p>                                                                                                               |
| reserved   | Refers to a memory space, register, field, or programming setting. Writes to a reserved location can result in unpredictable functionality or behavior. <ul style="list-style-type: none"> <li>• Do not modify the default value of a reserved programming setting, such as the reset value of a reserved register field.</li> <li>• Consider undefined locations in memory to be reserved.</li> </ul> |
| w1c        | Write 1 to clear: Refers to a register bitfield that must be written as 1 to be "cleared."                                                                                                                                                                                                                                                                                                             |

## 1.6 Acronyms and abbreviations

| Term    | Meaning                             |
|---------|-------------------------------------|
| AUTOSAR | Automotive Open System Architecture |
| GPIO    | General-purpose I/O                 |

Table continues on the next page...

## 1.7 References

In addition to this reference manual, the following documents provide additional information on the operation of the MPC5744P:

- IEEE-ISTO 5001-2003 Standard for a Global Embedded Processor Interface (Nexus)
- IEEE 1149.1-2001 standard - IEEE Standard Test Access Port and Boundary-Scan Architecture
- Power Architecture Book E V1.0 ([http://www.freescale.com/files/32bit/doc/user\\_guide/BOOK\\_EUM.pdf](http://www.freescale.com/files/32bit/doc/user_guide/BOOK_EUM.pdf) )

# Chapter 2

## Introduction

### 2.1 Overview

The MPC5744P Qorivva microcontroller is based on the Power Architecture® developed by Freescale Semiconductor. It targets chassis and safety applications and other applications requiring a high Automotive Safety Integrity Level (SIL). The MPC5744P is a SafeAssure solution.

#### 2.1.1 Overall architecture

All devices in this family are built around a safety concept based on delayed lock step, targeting an ISO26262 ASIL-D (Design) integrity level. According to FMEDA analysis, critical components of the microcontroller that must be replicated are the CPU core and DMA controller. Lock step Checking Units are implemented at each output of these blocks to compare the values between the redundant blocks.

In addition, the MPC5744P provides:

- A programmable Fault Collection and Control Unit (FCCU) to monitor the integrity status of the device and provide flexible safe state control.
- End-to-End Error Correcting Code (e2eECC) for improved fault tolerance and detection:
  - All bus masters generate Single Error Correcting and Double Error Detecting (SECCDED) code for every bus transaction
  - SECCDED covers 64-bit data and 29-bit address
  - ECC is stored in memories on write operations and validated by the master on every read operation

## 2.1.2 Core features

The host processor core of the MPC5744P is a CPU from the e200 family of compatible Power Architecture cores. The z425n3 dual issue core provides very high efficiency—high performance with minimum power dissipation—and operates at a maximum frequency of 200MHz.

The processor family implements low-cost versions of the *PowerISA 2.06* architecture. The z425n3 is a dual-issue 32-bit *PowerISA 2.06* VLE compliant design with 32-bit general purpose registers (GPRs).

An Embedded Floating-point (EFPU2) Auxiliary Processing Unit (APU) is provided to support real-time single-precision embedded numeric operations using the general-purpose registers.

A Lightweight Signal Processing Extension (LSP) APU is provided to support real-time SIMD fixed-point embedded numerics operations using the general-purpose registers. All arithmetic instructions that execute in the core operate on data in the GPRs.

The z425n3 core implements the VLE (variable-length encoding) ISA, providing improved code density. The VLE ISA is documented in *PowerISA 2.06*, a separate document. Note that the base PowerISA 2.06 fixed-length 32-bit instruction set is not directly supported.

The z425n3 processor integrates a pair of integer execution units, a branch control unit, instruction fetch unit, load/store unit, and a multi-ported register file capable of sustaining six read and three write operations per clock cycle. Most integer instructions execute in a single clock cycle. Branch target prefetching is performed by the branch unit to allow single-cycle branches in many cases.

The z425n3 also contains an 8 KB Instruction Cache and a 4 KB Data Cache as well as a Nexus Class 3+ debug module.

A Memory Protection Unit (MPU) is also included which supports protections of various instruction and data memory areas.

The MPC5744P has two e200z4 CPU core complexes running in delayed lock step.

## 2.1.3 Memory hierarchy

The MPC5744P has a single level of memory hierarchy consisting of 384 KB on-chip SRAM and 64 KB tightly coupled local data SRAM with ECC and 2.5 MB on-chip flash memory including ECC. Both the SRAM and the flash memory can hold instructions and data.

## 2.1.4 Off-chip communication

Off-chip communication is performed by a suite of serial protocols including FlexRay, CANs, enhanced SPIs (DSPIs), SCIs (LINFlexD), SIPI (via LFAST), Ethernet, and the SENT sensor interface.

## 2.1.5 I/O control

The System Integration Unit “Lite2” (SIUL2) performs several chip-wide configuration functions. SIUL2 is not software compatible to the SIUL used on Freescale C90 products.

The SIUL2 controls pad configuration and general-purpose input/output (GPIO). External interrupts and reset control are also found in the SIUL2. The internal multiplexer sub-block (IOMUX) provides multiplexing options for the device pins’ output and input paths (for example, daisy chaining the DSPIs and external interrupt signal).

## 2.1.6 Peripheral set compatibility

The MPC5744P peripheral set is compatible with the MPC5643L, providing high-end electrical motor control capability with very low CPU intervention due to the on-chip Cross Triggering Unit (CTU). For more information, see [Compatibility with MPC5643L](#).

## 2.1.7 Technology

The MPC5744P is developed with 55 nm embedded flash memory technology, providing a significant performance improvement.

## 2.2 Target applications

As a SafeAssure solution, the MPC5744P microcontroller targets applications requiring a high Automotive Safety Integrity Level (ASIL), especially:

- Chassis applications
- Electrical Stability Control (ESC)
- Higher-end Electrical Power Steering (EPS)
- Airbag and sensor fusion applications
- Radar applications

A typical aspect of ESC and EPS is the presence of an advanced electrical motor control periphery with special enhancements in the area of pulse width modulations, highly flexible timers, and functional safety. All devices in this family are built around a safety concept based on delayed lock step, targeting an ISO26262 ASIL-D integrity level.

## 2.3 Features

The following table summarizes the features of the MPC5744P.

**Table 2-1. MPC5744P feature summary**

| Feature                                                             | Details                                                     |
|---------------------------------------------------------------------|-------------------------------------------------------------|
| <b>CPU</b>                                                          |                                                             |
| Power Architecture                                                  | 2 x e200z4 in delayed lock step                             |
| Architecture                                                        | Harvard                                                     |
| Execution speed                                                     | 0 MHz to 200 MHz (+2% FM)                                   |
| Embedded FPU                                                        | Yes                                                         |
| Core MPU                                                            | 24 regions                                                  |
| Instruction Set PPC                                                 | No                                                          |
| Instruction Set VLE                                                 | Yes                                                         |
| Instruction cache                                                   | 8 KB, EDC                                                   |
| Data cache                                                          | 4 KB, EDC                                                   |
| Data local memory                                                   | 64 KB, ECC                                                  |
| System MPU                                                          | Yes (16 regions)                                            |
| <b>Buses</b>                                                        |                                                             |
| Core bus                                                            | AHB, 32-bit address, 64-bit data, e2e ECC                   |
| Internal periphery bus                                              | 32-bit address, 32-bit data                                 |
| <b>Crossbar</b>                                                     |                                                             |
| Master x slave ports                                                | 4 x 5                                                       |
| <b>Memory</b> —see <a href="#">Table 2-2</a> for additional details |                                                             |
| Code/data flash memory                                              | <b>2.5 MB</b> , ECC, RWW                                    |
| Data flash memory                                                   | Supported with RWW                                          |
| SRAM                                                                | <b>384 KB</b> , ECC                                         |
| Overlay access to SRAM from Flash Memory Controller                 | Yes                                                         |
| <b>Modules</b>                                                      |                                                             |
| Interrupt controller                                                | 32 interrupt priority levels, 16 SW programmable interrupts |
| PIT                                                                 | 1 module with 4 channels                                    |
| System Timer Module (STM)                                           | 1 module with 4 channels                                    |
| Software Watchdog Timer (SWT)                                       | Yes                                                         |
| eDMA                                                                | 32 channels, in delayed lock step                           |
| FlexRay                                                             | 1 module with 64 message buffer, dual channel               |
| FlexCAN                                                             | 3 modules with 64 message buffer                            |

*Table continues on the next page...*

**Table 2-1. MPC5744P feature summary (continued)**

| Feature                                     | Details                                                                                                                  |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| LINFlexD (UART and LIN with DMA support)    | 2 modules                                                                                                                |
| Clockout                                    | Yes                                                                                                                      |
| Fault Control and Collection Unit (FCCU)    | Yes                                                                                                                      |
| Cross Triggering Unit (CTU)                 | 2 modules                                                                                                                |
| eTimer                                      | 3 modules with 6 channels                                                                                                |
| FlexPWM                                     | 2 modules with 4 x (2+1) channels                                                                                        |
| Analog-to-digital converter (ADC)           | 4 modules with 12-bit ADC, each with 16 channels (25 external channels including shared channels plus internal channels) |
| Sine-wave generator (SGEN)                  | 32 point                                                                                                                 |
| SPI                                         | 4 modules<br>As many as 8 chip selects                                                                                   |
| CRC Unit                                    | Yes                                                                                                                      |
| SENT                                        | 2 modules with 2 channels                                                                                                |
| Interprocessor serial link interface (SIPI) | Yes                                                                                                                      |
| Junction temperature sensor                 | Yes (replicated module)                                                                                                  |
| Digital I/Os                                | ≥ 16                                                                                                                     |
| Peripheral register protection              | Yes                                                                                                                      |
| Ethernet                                    | Yes                                                                                                                      |
| Error Injection Module (EIM)                | Yes                                                                                                                      |
| <b>Supply</b>                               |                                                                                                                          |
| Device Power Supply                         | 3.3 V with external ballast transistor<br>3.3 V with external 1.25 V low drop-out (LDO) regulator                        |
| ADC Analog Reference voltage                | 3.15 V to 5.5 V                                                                                                          |
| <b>Clocking</b>                             |                                                                                                                          |
| Phase Lock Loop (PLL)                       | 1 x PLL and 1 coupled FMPLL                                                                                              |
| Internal RC Oscillator                      | 16 MHz                                                                                                                   |
| External Crystal Oscillator                 | 8 MHz to 40 MHz                                                                                                          |
| <b>Low power modes</b>                      |                                                                                                                          |
| HALT and STOP                               | Yes                                                                                                                      |
| <b>Debug</b>                                |                                                                                                                          |
| Nexus                                       | Level 3+, MDO and Aurora interface                                                                                       |

| MAPBGA                                      | 257 MAPBGA, 0.8 mm pitch, 14 mm x 14 mm outline                                                                          |
| <b>Temperature</b>                          |                                                                                                                          |
| Temperature range (junction)                | -40°C to +150°C, option for 165°C                                                                                        |
| Ambient temperature range (LQFP)            | -40°C to +125°C, 135°C option (with 165°C junction option)                                                               |
| Ambient temperature range (BGA)             | -40°C to +125°C, 135°C option (with 165°C junction option)                                                               |

**Table 2-2. Flash memory and SRAM sizes of MPC5744P, MPC5743P, MPC5742P, and MPC5741P**

| Part number | Flash memory | SRAM   |
|-------------|--------------|--------|
| MPC5744P    | 2.5 MB       | 384 KB |
| MPC5743P    | 2.0 MB       | 256 KB |
| MPC5742P    | 1.5 MB       | 192 KB |
| MPC5741P    | 1.0 MB       | 128 KB |

The MPC5744P architecture is based on the Automotive Core Platform (ACP) developed as part of the C55 Template.

This architecture is centered around the scalable e200 family, the AMBA standards, and Freescale's IP standards.

- AMBA is a 64-bit bus supporting a minimum bus cycle of 1 clock (one for address and one for data phase with limited pipelining). AMBA masters are implemented within the flexible crossbar and a very flexible synchronous protocol converter AMBA-to-IPS gasket (AIPS) is available.
- IPS is a 32-bit single master protocol that needs a minimum of 3 AMBA cycles for unbuffered write and minimum of 2 clocks for periphery read.

Redundancy is implemented for those blocks requiring it to ensure high diagnostic coverage for the key IP (for example: the e200z4 core, the DMA controller, and the AIPS bus bridge with the peripheral subsystems).

The architecture aims to guarantee maximum throughput of 200MHz.

### 2.3.1 Software debug and calibration

MPC5744P includes many features to facilitate software development. These features include:

- Nexus code execution trace on the main e200z4251n3 core
- Nexus data trace on all bus masters (DMA, Interprocessor bus, CPUs, and others)
- High speed Nexus trace output port consisting of two lanes of Aurora (LVDS) operating up to 1.25 Gbit/s

## 2.3.2 Compatibility with MPC5643L

The MPC5744P is compatible in important ways with the MPC5643L, a predecessor device in 90 nm CMOS technology. For customers migrating to the MPC5744P, this high degree of compatibility enables re-use and reduces unnecessary changes. The following table summarizes key aspects of the compatibility.

**Table 2-3. MPC5744P Compatibility with MPC5643L**

| Topic                              | Remarks for MPC5744P                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Package: 144 LQFP                  | Delivered in the same 144 LQFP with compatible pinout.                                                                                                                                                                                                                                                                                                                                  |
| Package: 257 MAPBGA                | Delivered in the same 257 MAPBGA package. The pinout is compatible, but with limitations due to the new LFAST and Aurora interfaces. Board changes are required.                                                                                                                                                                                                                        |
| Power supply concept               | Supports an external ballast transistor with internal regulation that allows compatible use. In addition, offers an option with an external supply for the 1.25 V core voltage.                                                                                                                                                                                                         |
| Supply monitoring                  | The same low voltage monitors for the 1.25 V core voltage and the 3.3 V voltage domains are offered. Both devices offer a high voltage detection for the 1.25 V domain.                                                                                                                                                                                                                 |
| Power supply pins                  | All power supply pins in 144 LQFP package are the same between the two parts, with an exception: the VDD_HV_REG_x pins are replaced with pads for reset/GPIO functionality because the MPC5744P does not offer an internal ballast supply option. When the MPC5744P is soldered into a board designed for the MPC5643L that is unchanged, these GPIOs must not be configured as output. |
| I/O multiplexing                   | All I/O multiplexing options in the 144 LQFP package are maintained to allow use of the same peripheral interfaces on the same pins. The MPC5744P adds additional multiplexing for new functionality.                                                                                                                                                                                   |
| ADC channels and reference voltage | The same pins can be mapped to the same ADC module channels. The ADC are 5 V input capable and have separate reference voltages. The use of ADC pads as inputs on the MPC5744P follows a 5 V I/O specification. In contrast, the specification is 3.3 V on the MPC5643L.                                                                                                                |
| External hardware for safety       | The same external components are required as on the MPC5643L: <ul style="list-style-type: none"> <li>• monitoring of the Error Out interface</li> <li>• external watchdog functionality (periodic communication)</li> <li>• external 3.3 V HVD</li> </ul>                                                                                                                               |

## 2.3.3 Block Diagram

The following figure is a top-level diagram that shows the functional organization of the system.

Figure 2-1. System Block Diagram

## Chapter 3

# Embedded Memories

### 3.1 Overview

The embedded memory architecture for MPC5744P includes the features:

- Onboard SRAM, including system SRAM, local data memory for each processor core, and overlay SRAM
- Onboard system ECC flash memory
- End-to-end ECC error detection and correction
- Built-in flash memory security features including censorship

### 3.2 SRAM

#### 3.2.1 System SRAM

MPC5744P includes 384 KB general-purpose on-chip ECC SRAM. The SRAM can be configured for either 0- or 1-wait state read operation latency using the PRCR1 register in the SRAM controller.

- See the SRAM controller memory map and register definition for details on configuration of the SRAM controller.
- See the Memory Map chapter for the MPC5744P SRAM map.

A portion of the system SRAM can be used as the overlay SRAM. *The overlay SRAM* feature included in MPC5744P is part of a comprehensive set of calibration and debug features. Overlay SRAM can be mapped over specific regions of on-chip flash memory so that any access to an overlaid flash address is routed to the overlay SRAM instead. This enables calibration of constant data without requiring additional external RAMs and calibration memory interfaces.

**NOTE**

Overlay SRAM is normally used for system development purposes only.

Timing for calibration accesses to a particular overlay SRAM are the same as access to the underlying flash if the overlay SRAM is not being used as a destination for trace streaming at the same time.

The overlay function is implemented using registers in the flash memory controller.

1. Using PFLASH Calibration Region Descriptors (PFCRDn) define one or more (up to 32) overlay regions.
2. Enable individual regions using the appropriate bits in the PFLASH Remap Descriptor Enable Register (PFCRDE).
3. Enable overlay using the PFCRCR[GRMEN] field.

See PFLASH calibration remap support for details on memory overlay (remapping).

### 3.2.2 Processor core local SRAM

MPC5744P includes local data SRAM (D-MEM) for the processor core to provide enhanced performance.

- Each processor core has 64 KB of data SRAM.

Each area of core SRAM is accessible by other processor cores and bus mastering peripheral devices. See the Memory Map for details.

## 3.3 Flash memory

Flash memory on MPC5744P consists of a flash memory controller and a flash memory array module. The flash controller provides flash configuration and control functions and manages the interface between the flash memory array and the device crossbar switch. The following figure shows the memory architecture.

**Figure 3-1. Device flash memory block diagram**

### 3.3.1 Flash memory controller

The MPC5744P flash controller acts as an interface between the system bus and the flash array and serves as the interface to the on-chip overlay RAM.

The flash controller contains a 4-entry, 2-way set-associative mini-cache that delivers flash read data with a zero-wait state response on lines that reside in the cache. Each entry contains one flash page, a 256-bit (32-byte) memory value. Read requests that miss the cache generate the needed flash array access.

The flash memory controller contains configuration registers which manage flash functionality such as read buffering in the mini-cache, access control, calibration RAM overlay remapping, and read wait state management of the flash.

See the Flash Memory Controller chapter for details.

### 3.3.2 Flash memory array

The MPC5744P on-chip flash provides programmable, non-volatile flash memory. The non-volatile memory (NVM) can be used for instruction storage, data storage, or both. The flash memory module interfaces the system bus to a dedicated flash memory array controller. It supports a 64-bit data bus width at the system bus port, and a 256-bit read data interface to flash memory. The module contains a 2-way set-associative mini-cache.

### 3.3.2.1 Features

- 2.5MB of Flash in unique multi partitioned hard macro
- Flash partitioning
  - 4x 16 KB in partition 0/1 (2x blocks EEPROM emulation enabled)
  - 2x 32 KB in partition 2/3 (EEPROM emulation enabled)
  - 6x 64 KB in partition 4/5
  - 8x 256 KB in partition 6/7
- Support for reading-while-writing when the accesses are to different partitions.
- Flash protection
  - Write protection and OTP available for dedicated blocks.
- Test information stored in a non-volatile UTest block which will be OTP.
- Erase suspend, program suspend and erase-suspended program all supported.
- 256 KB address space

### 3.3.2.2 UTest memory space

MPC5744P contains a 16 KB area of One-Time Programmable (OTP) flash memory for storage of test information and device configuration data. See Chapter 5, Memory Map for the MPC5744P UTEST flash memory map.

## 3.4 End-to-end Error Correction Code (e2eECC)

To support market requirements related to improved functional and transient fault detection capabilities, this family of automotive microcontrollers includes end-to-end ECC support. This end-to-end ECC (aka e2eECC) is structurally different than traditional "ECC at memory" functionality since it provides for robust error detection capabilities from one endpoint of an information transfer to another endpoint with temporary information storage in an intermediate component(s). While memory protected by ECC/EDC traditionally generates and checks additional error parity information local to the memory unit to detect and/or correct errors which have occurred on stored data in the memory, e2eECC instead performs generation of error protection codes at the source of data generation, sending the encoded data and error protection codes to intermediate storage when a memory write is initiated by a bus master, and performs a check of data integrity using the previously stored error protection codes at a data memory when a read of stored information is requested by a bus master. The intermediate storage may transform the generated error protection codes into another format for storage and then

may regenerate the codes for provision when a request is made to read the stored information, or it may simply store the original protection codes unaltered, depending on the particular unit.

Additionally, the error protection codes are generated based on more than just the data associated with a storage location in order to protect additional information associated with an access. In particular, address information corresponding to the access location of the stored information is combined with the store data at the data source to generate error protection codes which cover certain types of addressing errors which may occur in the system interconnect or in the memory unit. Checking of the error protection codes may be done at the memory unit on a store to ensure that no corruption of address or data information has occurred while the request has transitioned through the device from the bus master source, as well as to ensure that within the storage memory, address decoding was performed properly (although not all address decoding errors can be detected this way), or it may simply store the received data and protection codes at the address it receives. On a read request from a bus master, the memory unit retrieves the data information and error protection codes corresponding to the received address from the storage location(s), and supplies the data along with the error protection codes to the requesting device. The requesting device uses a locally stored address value corresponding to the read request to check the returning data and error protection codes to ensure that no errors have occurred in either addressing the memory, or in the retrieved data, thus ensuring that the address sent for the request was not corrupted, that the addressed location was actually accessed (to the extent it is possible to ensure), and that the stored data was error free, to the extent the ECC coding scheme is able to detect. As a result, the fault coverage provided by the end-to-end check is considerably more robust than the previous implementation of locally generated and checked/corrected error protection at each memory unit.

A comparison of the traditional and e2eECC approaches is shown in the following table.

**Table 3-1. ECC comparison of data write then read sequence**

| Traditional ECC                                                                                                       | End-to-End ECC (e2eECC)                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Bus master initiates data write                                                                                       | Bus master initiates data write and generates ECC checkbits based on 29-bit address and 64-bit data fields |
| Data write transfer routed from bus master to appropriate bus slave                                                   | Data write transfer (including checkbits) routed from bus master to appropriate bus slave                  |
| For a bus memory slave, generate the ECC checkbits based on the data value and store data + checkbits into the memory | For a bus memory slave, store data + checkbits into the memory                                             |
| Bus master initiates data read of previously written memory location                                                  | Bus master initiates data read of previously written memory location                                       |
| Data read transfer routed from bus master to appropriate bus slave                                                    | Data read transfer routed from bus master to appropriate bus slave                                         |

*Table continues on the next page...*

**Table 3-1. ECC comparison of data write then read sequence (continued)**

| Traditional ECC                                                                                                                                                                                                                    | End-to-End ECC (e2eECC)                                                                                                                                                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| For a bus memory slave, the memory array is accessed, the controller performs the ECC checkbit decode and syndrome generation, performs any needed single-bit correction and drives the read data onto the system bus interconnect | For a bus memory slave, the memory array is accessed, and the controller passes the read data and associated checkbits onto the system bus interconnection                        |
| The bus master captures the read data and continues                                                                                                                                                                                | The bus master captures the read data and associated checkbits, performs the ECC checkbit decode and syndrome generation, performs any needed single-bit correction and continues |

The scope of differences in the operations "covered" by the ECC checks is readily apparent. Thus, the e2eECC concept provides improved fault detection capabilities in two important aspects:

1. The entire data transaction, from the initiating bus master, through the entire platform crossbar steering mechanism to the destination slave target is covered during write accesses. Likewise, a read is checked from the initiating bus master, through the crossbar steering mechanism, through the actual memory read and transmission of the data plus checkbits back to the bus master, where the integrity and correctness of the entire transaction is checked.
2. The selected ECC provides protection of both the address field as well as the data field, again for improved fault coverage.

Additionally, this particular structure also provides a significant implementation improvement. The traditional ECC at the memory approach places the checkbit decode and error syndrome generation with the error/no\_error state affecting whether the system bus transfer must be stalled (to correct a single bit error or report a noncorrectable event) or is allowed to complete (for error free transfers) in a critical timing arc which often sets the upper limit of operating frequency of the microcontroller. With the e2eECC scheme, the checkbit decode and error syndrome logic is located in the requesting bus master, where there are generally more degrees of implementation freedom and the error/no\_error state determination is removed from the system bus cycle termination logic, producing an improved timing arc and generally, higher operating speeds.

Errors which occur within the system interconnect are typically manifested as an incorrect address, incorrect write data, or incorrect read data to be presented to the slave or back to the master. Errors occurring within the storage typically manifest themselves eventually in corrupted read data or checkbits being returned to a requestor. While not all possible errors can be detected this way, this approach provided a substantial improvement versus traditional methods. Additional on-line diagnostics and/or additional hardware should be able to catch a majority of the errors not covered directly by the e2eECC scheme.

# Chapter 4

## Signal Description

### 4.1 Production packages

The device has the following production packages:

- 144LQFP
- 257MAPBGA

The following table shows features/pins provided by the 257MAPBGA compared to the 144LQFP.

**Table 4-1. MPC5744P features differing by package**

| Feature  | 144LQFP                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 257MAPBGA                                                                                                                                                                             |

## 4.3 Pin/ball descriptions

The following sections provide signal descriptions and related information about the functionality and configuration of the device. Note that this section is under development.

### 4.3.1 Pin/ball startup and reset states

The following table provides startup state and reset state information for device pins/balls.

The startup state and subsequent states of the following pins/balls cannot be configured by the user:

- JCOMP
- TMS
- TCK
- XTAL/EXTAL
- FCCU\_F[0] and FCCU\_F[1]
- EXT\_POR\_B
- RESET\_B

The user can configure the state after reset of the following pins/balls by programming the applicable MSCRs/IMCRs:

- GPIOs
- Analog inputs
- TDI
- TDO
- NMI\_B
- FAB
- ABS[0]
- ABS[2]

**Table 4-2. Pin/ball startup and reset states**

| Pin/ball                   | Startup state <sup>1</sup> | State during reset    | State after reset     | 144LQFP           | 257MAPBGA         |
|----------------------------|----------------------------|-----------------------|-----------------------|-------------------|-------------------|
| GPIOs                      | hi-z                       | hi-z                  | hi-z                  | Note              | Note <sup>2</sup> |
| Analog inputs <sup>3</sup> | hi-z                       | hi-z                  | hi-z                  | Note <sup>2</sup> | Note <sup>2</sup> |
| JCOMP (TRST)               | hi-z                       | input, weak pull-down | input, weak pull-down | Note              | Note <sup>4</sup> |
| TDI                        | hi-z                       | input, weak pull-up   | input, weak pull-up   | Note <sup>4</sup> | Note <sup>4</sup> |
| TDO                        | hi-z                       | output, hi-z          | output, hi-z          | Note <sup>4</sup> | Note <sup>4</sup> |
| TMS                        | hi-z                       | input, weak pull-up   | input, weak pull-up   | Note <sup>4</sup> | Note <sup>4</sup> |

| ABS[0]                 | hi-z                       | input, weak pull-down | input, weak pull-down | Note <sup>4</sup> | Note <sup>4</sup> |

1. Startup state is exited when the core and high-voltage supplies reach minimum levels as defined in the Power Management chapter.
2. See [Generic pins/balls](#).
3. Not all non-supply or reference pins on the device are explicitly defined in this table.
4. See [System pins/balls](#).
5. This pin/ball is dedicated to and directly connected to a peripheral module pin.

## 4.3.2 Power supply and reference voltage pins/balls

**Table 4-3. Power supply and reference voltage pins/balls**

| Supply                 |       |                          | Package |           |
|------------------------|-------|--------------------------|---------|-----------|
| Symbol                 | Type  | Description              | 144LQFP | 257MAPBGA |
| V <sub>DD_LV_COR</sub> | Power | Low voltage power Supply | 18      | F6        |
|                        |       |                          | 39      | F7        |
|                        |       |                          | 70      | F8        |
|                        |       |                          | 93      | F9        |
|                        |       |                          | 131     | F10       |
|                        |       |                          | 135     | F11       |
|                        |       |                          |         | F12       |
|                        |       |                          |         | G6        |
|                        |       |                          |         | G12       |
|                        |       |                          |         | H6        |
|                        |       |                          |         | H12       |
|                        |       |                          |         | J6        |
|                        |       |                          |         | J12       |
|                        |       |                          |         | K6        |
|                        |       |                          |         | K12       |
|                        |       |                          |         | L6        |

1. VPP\_TEST must be connected to ground.
2. Do not connect on the board.

### 4.3.4 LVDS pins/balls

The following tables contain information on LVDS pin functions for the devices.

**Table 4-5. SIPI LFAST LVDS pin descriptions**

| Functional block          | Port pin          | Signal   | Signal description                                        | Direction | 257MAPBGA |
|---------------------------|-------------------|----------|-----------------------------------------------------------|-----------|-----------|
| SIPI LFAST <sup>1,2</sup> | I[5]              | SIPI_TXN | Interprocessor Bus LFAST, LVDS Transmit Negative Terminal | O         | N15       |
|                           | C[12]             | SIPI_TXP | Interprocessor Bus LFAST, LVDS Transmit Positive Terminal | O         | M14       |
|                           | I[6]              | SIPI_RXN | Interprocessor Bus LFAST, LVDS Receive Negative Terminal  | I         | M15       |
|                           | G[7] <sup>3</sup> | SIPI_RXP | Interprocessor Bus LFAST, LVDS Receive Positive Terminal  | I         | M16       |

1. DRCLK and TCK/DRCLK usage for SIPI LFAST are described in the reference manual's SIPI LFAST chapters.
2. For the MSCR SSS value of the port pin, see [Table 1](#).
3. The 144LQFP package has G[7] and C[12] but no SIPI LFAST functionality.

### CAUTION

SIPI LFAST pins are muxed with GPIOs. Do not use GPIO and SIPI LFAST functionality in parallel.

**Table 4-6. Aurora LVDS pin descriptions**

| Functional block              | Pad   | Signal | Signal description                                           | Direction | 257MAPBGA <sup>1</sup> |
|-------------------------------|-------|--------|--------------------------------------------------------------|-----------|------------------------|

1. Nexus Aurora High Speed Trace is available only on the 257MAPBGA.

### 4.3.5 Generic pins/balls

The I/O signal descriptions for the device are in the following table. It contains the port definition, multiplexing, direction, pad type, and package pin/ball numbers for each I/O pin on the device.

MSCR registers are used for alternative (ALT) mode selection and programming of pad control options.

IMCR registers are used to configure input muxing by peripheral. See [Peripheral input muxing](#) for details.

See [Table 4-16](#) for the MSCR register address map and [Table 4-17](#) for the IMCR register address map.

**Table 4-7. Pin muxing**

| Port Pin | SIUL2 MSCR/ IMCR Number | MSCR/ IMCR SSS Value <sup>1</sup> | Signal  | Module        | Short Signal Description             | Dir | LQFP144 | BGA257 |

| NMI_B    | MSCR[154]               | 0000 (Default)                    | NMI_B                                        | Core                | Non-Maskable Interrupt                | I   | 1       | E4     |

1. Selecting an alternative function with a "Reserved" source function causes the pin to enter a null state (input buffer and output buffer enables are both 0).
2. **(Default) = ALT mode configuration after reset.**
3. Changing the B[5] configuration during debug might affect the availability of TDI.
4. ADC analog input: Program corresponding MSCR APC bit and enable ADC to switch on the analog input path. See [Table 1](#) for details.
5. Shared with SIPI LFAST transmit pad SIPI\_TXP. Alternative modes and GPIO must be disabled (OBE=0, IBE=0) if port is used for SIPI LFAST.
6. To operate D[7] as GPIO, disable the Sine Wave Generator (SGEN) and the peripheral bus clock of the SGEN: Program the MC\_ME\_PCTL239 register to select an MC\_ME\_RUN\_PCn (or MC\_ME\_LP\_PCn) configuration where the field for the desired mode is 0.
7. SGEN output if SGEN is enabled. See [Table 1](#) for details.
8. Shared with SIPI LFAST receive pad SIPI\_RXP. Alternative modes and GPIO must be disabled (OBE=0, IBE=0) if port is used for SIPI LFAST.
9. Shared with SIPI LFAST receive pad SIPI\_TXN. Alternative modes and GPIO must be disabled (OBE=0, IBE=0) if port is used for SIPI LFAST.
10. Shared with SIPI LFAST receive pad SIPI\_RXN. Alternative modes and GPIO must be disabled (OBE=0, IBE=0) if port is used for SIPI LFAST.

The following table list ports that are not implemented. The corresponding control and data registers are not implemented.

**Table 4-8. Ports - Not Implemented**

| Port Name | Port Index  |
|-----------|-------------|
| C         | 3,8,9       |
| D         | 13,15       |
| E         | 1,3,8       |
| F         | 1,2         |
| G         | 0,1,[12:15] |
| H         | [0:3]       |
| J         | [10:15]     |

Any attempt to access unimplemented MSCRs generates a bus error. The read value from unimplemented ports must be masked in case of parallel port accesses.

### 4.3.6 Peripheral input muxing

The following table describes the peripheral muxing capabilities of the device. See [Table 4-17](#) for IMCR register addresses.

**Table 4-9. Peripheral muxing**

| Destination peripheral | Destination functions | IMCR number | IMCR[SSS] field value       | Source peripherals | Source functions      |
|------------------------|-----------------------|-------------|-----------------------------|--------------------|-----------------------|

1. (Default) = configuration after reset
2. Selecting an alternate function with a 'Reserved' source function causes the pin to enter a null state (Input buffer and Output buffer enables both at 0).

**Table 4-10. Peripheral muxing example**

| SSS field value in IMCR[214] | Result                                                        |
|------------------------------|---------------------------------------------------------------|
| 0001                         | I/O-Pad I[12] is connected to SENT_1 Receive input SENT_RX[1] |
| 0010                         | I/O-Pad J[6] is connected to SENT_1 Receive input SENT_RX[1]  |

See [Table 4-8](#) concerning the availability of port pins on the packages.

### 4.3.7 Pins with analog functions

The following table describes pins with analog functions.

**Table 4-11. Pins with analog functions**

| Pin   | 144LQFP | 257MAPBGA | Connected Analog IPs    | Analog Function <sup>1</sup> | MSCR#           |
|-------|---------|-----------|-------------------------|------------------------------|-----------------|
| B[7]  | 43      | R5        | ADC0                    | AN[0]                        | 23              |
| B[8]  | 47      | P7        | ADC0                    | AN[1]                        | 24              |
| B[9]  | 52      | U7        | ADC0/ADC1               | AN[11]                       | 25              |
| B[10] | 53      | R8        | ADC0/ADC1               | AN[12]                       | 26              |
| B[11] | 54      | T8        | ADC0/ADC1               | AN[13]                       | 27              |
| B[12] | 55      | U8        | ADC0/ADC1               | AN[14]                       | 28              |
| B[13] | 60      | R10       | ADC1                    | AN[0]                        | 29              |
| B[14] | 64      | P11       | ADC1                    | AN[1]                        | 30              |
| B[15] | 62      | R11       | ADC1                    | AN[2]                        | 31              |
| C[0]  | 66      | R12       | ADC1                    | AN[3]                        | 32              |
| C[1]  | 41      | T4        | ADC0                    | AN[2]                        | 33              |
| C[2]  | 45      | U5        | ADC0                    | AN[3]                        | 34              |
| D[7]  | 37      | R4        | Sine Wave Generator Out | anaout                       | NA <sup>2</sup> |
| E[0]  | 68      | T13       | ADC1                    | AN[5]                        | 64              |
|       |         |           | ADC3                    | AN[4]                        |                 |
| E[2]  | 49      | U6        | ADC0                    | AN[5]                        | 66              |
| E[4]  | 42      | U4        | ADC0                    | AN[7]                        | 68              |
| E[5]  | 44      | T5        | ADC0                    | AN[8]                        | 69              |
| E[6]  | 46      | R6        | ADC0/ADC2               | AN[4]                        | 70              |
| E[7]  | 48      | T6        | ADC0                    | AN[6]                        | 71              |
| E[9]  | 61      | U10       | ADC1                    | AN[7]                        | 73              |
|       |         |           | ADC3                    | AN[6]                        |                 |
| E[10] | 63      | T11       | ADC1                    | AN[8]                        | 74              |
|       |         |           | ADC3                    | AN[7]                        |                 |
| E[11] | 65      | U11       | ADC1                    | AN[4]                        | 75              |
|       |         |           | ADC3                    | AN[3]                        |                 |
| E[12] | 67      | T12       | ADC1                    | AN[6]                        | 76              |
|       |         |           | ADC3                    | AN[5]                        |                 |
| J[5]  |         | P8        | ADC2/ADC3               | AN[0]                        | 149             |
| J[6]  |         | P9        | ADC2/ADC3               | AN[1]                        | 150             |
| J[7]  |         | P10       | ADC2/ADC3               | AN[2]                        | 151             |

1. For pin multiplexed ADC functions - both ADCs will have the same channel number unless otherwise specified.

2. The Sine Wave Generator must be enabled to switch on the analog output function.

### 4.3.8 Mapping of ports to PGPDO registers

The following table shows the mapping of the GPIO ports to the Parallel GPIO Pad Data Out (PGPDO) registers. See the dedicated SIUL2 chapter for more information.

**Table 4-12. Mapping of ports to PGPDO registers**

| Port <sup>1</sup> | Port width | PGPDO field <sup>2</sup> | Address    |
|-------------------|------------|--------------------------|------------|
| A                 | 16         | PPDO[0]                  | 0xFFFC1700 |
| B                 | 16         | PPDO[1]                  | 0xFFFC1702 |
| C                 | 16         | PPDO[2]                  | 0xFFFC1704 |
| D                 | 16         | PPDO[3]                  | 0xFFFC1706 |
| E                 | 16         | PPDO[4]                  | 0xFFFC1708 |
| F                 | 16         | PPDO[5]                  | 0xFFFC170A |
| G                 | 16         | PPDO[6]                  | 0xFFFC170C |
| H                 | 16         | PPDO[7]                  | 0xFFFC170E |
| I                 | 16         | PPDO[8]                  | 0xFFFC1710 |
| J                 | 16         | PPDO[9]                  | 0xFFFC1712 |

1. See Ports - Not Implemented table for unimplemented port pins.

2. All fields are 16 bits wide.

The following table shows the mapping of the GPIO ports to Parallel GPIO Pad Data In (PGPDI) registers. See the dedicated SIUL2 chapter for more information.

**Table 4-13. Mapping of ports to PGPDI registers**

| Port <sup>1</sup> | Port width | PGPDI field <sup>2</sup> | Address    |
|-------------------|------------|--------------------------|------------|
| A                 | 16         | PPDI[0]                  | 0xFFFC1740 |
| B                 | 16         | PPDI[1]                  | 0xFFFC1742 |
| C                 | 16         | PPDI[2]                  | 0xFFFC1744 |
| D                 | 16         | PPDI[3]                  | 0xFFFC1746 |
| E                 | 16         | PPDI[4]                  | 0xFFFC1748 |
| F                 | 16         | PPDI[5]                  | 0xFFFC174A |
| G                 | 16         | PPDI[6]                  | 0xFFFC174C |
| H                 | 16         | PPDI[7]                  | 0xFFFC174E |
| I                 | 16         | PPDI[8]                  | 0xFFFC1750 |
| J                 | 16         | PPDI[9]                  | 0xFFFC1752 |

1. See Ports - Not Implemented table for unimplemented port pins.

2. All fields are 16 bits wide.

### 4.3.9 Address map and configuration for MSCR/IMCR registers

The following tables provide the memory map for the MSCRs and IMCRs used to configure alternative modes and peripheral input muxing. See the SIUL2 chapter for the registers' layouts.

[Table 4-16](#) shows the default settings for the pad control fields and which pad control fields are programmable (see [Table 4-15](#) for conventions).

The default settings (configuration after reset) for the MSCR SSS fields are documented in [Table 4-7](#).

[Table 4-17](#) shows the IMCRs by peripheral: destination function, IMCR number, IMCR address, default configuration and programmability of the INV field, and default value for the SSS field.

**Table 4-14. MSCR pad control fields**

| MSCR field | Brief description                      |
|------------|----------------------------------------|
| SRC[1:0]   | Slew Rate Control                      |
| OBE        | Output Buffer Enable                   |
| ODE        | Open Drain Enable                      |
| SMC        | Safe Mode Control                      |
| APC        | Analog Pad Control                     |
| IBE        | Input Buffer Enable                    |
| HYS        | Input Hysteresis                       |
| PUS        | Pull Select: 0 = Pulldown, 1 = Pullup  |
| PUE        | Pull Enable: 0 = Disabled, 1 = Enabled |
| INV        | Invert                                 |

[Table 4-15](#) describes conventions used in [Table 4-16](#) and [Table 4-17](#).

**Table 4-15. Conventions used in following MSCR and IMCR tables**

| Abbreviation | Configuration during/after reset | Programmable by user?                       |
|--------------|----------------------------------|---------------------------------------------|
| D            | Disabled                         | No: permanently disabled or not implemented |
| E            | Enabled                          | No: permanently enabled                     |
| P(0)         | Reset value is 0                 | Yes                                         |
| P(1)         | Reset value is 1                 | Yes                                         |
| P(D)         | Disabled                         | Yes                                         |
| P(E)         | Enabled                          | Yes                                         |

1. P(D) means the Invert function is disabled by default but can be programmed by the user.

# Chapter 5

## Memory Map

### 5.1 Memory Map

The following table shows the device memory map for the MPC5744P.

All addresses on the MPC5744P, including many that are reserved, are identified in the table. The addresses represent the physical addresses assigned to each region or module name. All memory not listed in this table is reserved, and access to those locations may produce undesirable results.

**Table 5-1. Overview memory map**

| Start address                                          | End address  | Allocated size | Used size | PCTL number | Description                                                               |
|--------------------------------------------------------|--------------|----------------|-----------|-------------|---------------------------------------------------------------------------|
| Flash memory—see <a href="#">Table 5-4</a> for details |              |                |           |             |                                                                           |
| 0x00000000                                             | 0x003FFFFFFF | -              |           |             | Reserved                                                                  |

| 0xFFFFC000    | 0xFFFFFFF   | 16 KB          |           | -           | Boot Assist Module (BAM)                      |

1. DMA is a platform IP and in low power modes the clock to all platform IPs is shut off. Therefore the DMA cannot be kept ON in low power modes. So PCTL has no impact during STOP/HALT. modes.
2. The PMC register locations overlap with the memory map slot of the MC\_PCU. For more information, see [Power control registers](#).
3. The locations of the IRCOSC, XOSC, and PLLDIG modules' registers overlap with the memory map slot of the MC\_CGM. For more information, see [Clock generation registers](#).

### 5.1.1 Power control registers

The MC\_PCU works as a bus bridge for the PMC module. The locations of the PMC's registers overlap with the memory map slot allocated to the MC\_PCU. The following table identifies the offsets of the MC\_PCU and PMC registers relative to the base address of the MC\_PCU.

**Table 5-2. MC\_PCU memory slot and relative register locations**

| Start offset (hex) | End offset (hex) | Module registers |
|--------------------|------------------|------------------|
| 0000               | 0043             | MC_PCU registers |
| 0044               | 03FF             | Reserved         |
| 0400               | 07FF             | PMC registers    |
| 0800               | 3FFF             | Reserved         |

### 5.1.2 Clock generation registers

The MC\_CGM works as a bus bridge for the IRCOSC, XOSC, and PLLDIG modules. The locations of these modules' registers overlap with the memory map slot allocated to the MC\_CGM. The following table identifies the offsets of these registers, including the actual MC\_CGM registers, relative to the base address of the MC\_CGM.

**Table 5-3. MC\_CGM memory slot and relative module register locations**

| Start offset (hex) | End offset (hex) | Module registers |
|--------------------|------------------|------------------|
| 0000               | 003F             | IRCOSC registers |
| 0040               | 007F             | Reserved         |
| 0080               | 00BF             | XOSC registers   |
| 00C0               | 00FF             | Reserved         |
| 0100               | 013F             | PLLDIG registers |
| 0140               | 06FF             | Reserved         |
| 0700               | 08CB             | MC_CGM registers |
| 08CC               | 3FFF             | Reserved         |

### 5.1.3 Flash memory and RAM memory maps

The following table is the detailed flash memory map for the MPC5744P.

**Table 5-4. Flash memory map**

| Start address                          | End address  | Allocated size (KB) | Complete flash memory block structure            | RWW partition | Block size |
|----------------------------------------|--------------|---------------------|--------------------------------------------------|---------------|------------|
| Reserved - no overlay                  |              |                     |                                                  |               |            |
| 0x00000000                             | 0x003FFFFFFF | -                   | Reserved                                         |               |            |

# Chapter 6

## Functional Safety

### 6.1 Introduction

The MPC5744P is developed according to ISO 26262 and has an integrated safety concept targeting safety-related systems requiring high safety integrity levels. In order to support the integration of the MPC5744P into safety-related systems, the following documentation is available:

- Reference Manual (MPC5744PRM) - Describes the MPC5744P functionality
- Data Sheet (MPC5744PDS) - Describes the MPC5744P operating conditions
- Safety Manual (MPC5744PSM) - Describes the MPC5744P safety concept and possible safety mechanisms (integrated in MPC5744P, system level hardware or system level software), as well as measures to reduce dependent failures
- Dynamic FMEDA - Inductive analysis enabling customization of system level safety mechanisms, including the resulting safety metrics for ISO 26262 (SPFM, LFM & PMHF) and IEC 61508 (SFF & Beta IC Factor)
- FMEDA Report - Describes the FMEDA methodology and safety mechanisms supported in the FMEDA, including source of failure rates, failure modes and assumptions made during the analysis.

The Reference Manual, Data Sheet and Safety Manual are available for download on the [MPC5744P product page](#). The Dynamic FMEDA and FMEDA report are available upon request. The MPC5744P is a SafeAssure solution; for further information regarding functional safety at Freescale, visit [www.freescale.com/safeassure](http://www.freescale.com/safeassure).

# Chapter 7

## Chip Configuration

### 7.1 Introduction

This information consists of details about the individual modules of the microcontroller. The information includes:

- module block diagrams showing immediate connections within the device,
- specific module-to-module interactions not necessarily discussed in the individual module chapters, and
- links for more information.

### 7.2 Core modules

The microcontroller has two separate cores that perform various computational and control functions.

- The Main Core\_0 uses an e200z425n3 core. This core is used for general computational functions.
- The Checker Core\_0s uses an e200z424 core. When enabled, Checker Core\_0s operates in lock step mode with Main Core\_0 executing exactly the same instructions as Main Core\_0. Thus, Checker Core\_0s checks to insure that Main Core\_0 is executing correctly.

For more information, see the Core Complex Overview.

## 7.2.1 Core reset settings

The following table shows the state of the *PowerISA 2.06* architected registers and other optional resources immediately after a system reset.

**Table 7-1. Reset settings for e200z4 resources**

| Resource        | System reset setting     |
|-----------------|--------------------------|
| Program Counter | p_rstbase[0:29]    2'b00 |
| GPRs            | Unaffected <sup>2</sup>  |

| XER                  | 0x0000_0000                            |

1. The levels that determine these bits are set by the factory and may change between revisions of the device.
2. Undefined on **POR** assertion, unchanged on **external PORESET (EXT\_POR\_B)** assertion.
3. Reset by processor reset **external PORESET (EXT\_POR\_B)** if DBCR0[EDM]=0, as well as unconditionally by **POR**.
4. Read-only registers.

## 7.2.2 Special Purpose Register summary

*PowerISA 2.06* and implementation-specific SPRs for the e200z4251n3 and e200z424 cores are listed in the following table. All registers are 32 bits in size. Register bits are numbered from bit 0 to bit 31 (most-significant to least-significant). Shaded entries

represent optional registers. An SPR may be read or written with the **mf spr** and **mt spr** instructions. In the instruction syntax, compilers should recognize the mnemonic name given in the following table.

**Table 7-2. Special Purpose Registers**

| Mnemonic        | Name                                                    | SPR number | Access                  | Privileged | e200z specific |
|-----------------|---------------------------------------------------------|------------|-------------------------|------------|----------------|
| XER             | Integer Exception Register                              | 1          | R/W                     | No         | No             |
| LR              | Link Register                                           | 8          | R/W                     | No         | No             |
| CTR             | Count Register                                          | 9          | R/W                     | No         | No             |
| SRR0            | Save/Restore Register 0                                 | 26         | R/W                     | Yes        | No             |
| SRR1            | Save/Restore Register 1                                 | 27         | R/W                     | Yes        | No             |
| PID0            | Process ID Register                                     | 48         | R/W                     | Yes        | No             |
| CSRR0           | Critical Save/Restore Register 0                        | 58         | R/W                     | Yes        | No             |
| CSRR1           | Critical Save/Restore Register 1                        | 59         | R/W                     | Yes        | No             |
| DEAR            | Data Exception Address Register                         | 61         | R/W                     | Yes        | No             |
| ESR             | Exception Syndrome Register                             | 62         | R/W                     | Yes        | No             |
| IVPR            | Interrupt Vector Prefix Register                        | 63         | R/W                     | Yes        | No             |
| USPRG0 (VRSAGE) | User SPR General 0 (renamed to VRSAGE in PowerISA 2.06) | 256        | R/W                     | No         | No             |
| SPRG0           | SPR General 0                                           | 272        | R/W                     | Yes        | No             |
| SPRG1           | SPR General 1                                           | 273        | R/W                     | Yes        | No             |
| SPRG2           | SPR General 2                                           | 274        | R/W                     | Yes        | No             |
| SPRG3           | SPR General 3                                           | 275        | R/W                     | Yes        | No             |
| PIR             | Processor ID Register                                   | 286        | R/W                     | Yes        | No             |
| PVR             | Processor Version Register                              | 287        | Read-only               | Yes        | No             |
| DBSR            | Debug Status Register                                   | 304        | Read/Clear <sup>1</sup> | Yes        | No             |
| DBCR0           | Debug Control Register 0                                | 308        | R/W                     | Yes        | No             |
| DBCR1           | Debug Control Register 1                                | 309        | R/W                     | Yes        | No             |
| DBCR2           | Debug Control Register 2                                | 310        | R/W                     | Yes        | No             |
| IAC1            | Instruction Address Compare 1                           | 312        | R/W                     | Yes        | No             |
| IAC2            | Instruction Address Compare 2                           | 313        | R/W                     | Yes        | No             |
| IAC3            | Instruction Address Compare 3                           | 314        | R/W                     | Yes        | No             |
| IAC4            | Instruction Address Compare 4                           | 315        | R/W                     | Yes        | No             |
| DAC1            | Data Address Compare 1                                  | 316        | R/W                     | Yes        | No             |
| DAC2            | Data Address Compare 2                                  | 317        | R/W                     | Yes        | No             |
| DVC1            | Data Value Compare 1                                    | 318        | R/W                     | Yes        | No             |
| DVC2            | Data Value Compare 2 <sup>2</sup>                       | 319        | R/W                     | Yes        | No             |
| TIR             | Thread identification register                          | 446        | Read-only               | Yes        | No             |
| SPEFSCR         | LSP/EFP APU status and control register                 | 512        | R/W                     | No         | No             |
| L1CFG0          | L1 cache config register 0                              | 515        | Read-only               | No         | Yes            |
| L1CFG1          | L1 cache config register 1                              | 516        | Read-only               | No         | Yes            |

**Table 7-2. Special Purpose Registers (continued)**

| Mnemonic           | Name                                                  | SPR number | Access                  | Privileged | e200z specific |
|--------------------|-------------------------------------------------------|------------|-------------------------|------------|----------------|
| NPIDR              | Nexus 3 Process ID register                           | 517        | R/W                     | No         | Yes            |
| DBCR3              | Debug control register 3                              | 561        | R/W                     | Yes        | Yes            |
| DBCR4              | Debug control register 4                              | 563        | R/W                     | Yes        | Yes            |
| DBCR5              | Debug control register 5                              | 564        | R/W                     | Yes        | Yes            |
| IAC5               | Instruction Address Compare 5                         | 565        | R/W                     | Yes        | Yes            |
| IAC6               | Instruction Address Compare 6                         | 566        | R/W                     | Yes        | Yes            |
| IAC7               | Instruction Address Compare 7                         | 567        | R/W                     | Yes        | Yes            |
| IAC8               | Instruction Address Compare 8                         | 568        | R/W                     | Yes        | Yes            |
| MCSR0              | Machine Check Save/Restore Register 0                 | 570        | R/W                     | Yes        | Yes            |
| MCSR1              | Machine Check Save/Restore Register 1                 | 571        | R/W                     | Yes        | Yes            |
| MCSR               | Machine Check Syndrome Register                       | 572        | Read/Clear <sup>3</sup> | Yes        | Yes            |
| MCAR               | Machine Check Address Register                        | 573        | R/W                     | Yes        | Yes            |
| DSRR0              | Debug save/restore register 0                         | 574        | R/W                     | Yes        | Yes            |
| DSRR1              | Debug save/restore register 1                         | 575        | R/W                     | Yes        | Yes            |
| DDAM               | Debug Data Acquisition Messaging register             | 576        | R/W                     | No         | Yes            |
| DAC3               | Data Address Compare 3                                | 592        | R/W                     | Yes        | Yes            |
| DAC4               | Data Address Compare 4                                | 593        | R/W                     | Yes        | Yes            |
| DBCR7              | Debug control register 7                              | 596        | R/W                     | Yes        | Yes            |
| DBCR8              | Debug control register 8                              | 597        | R/W                     | Yes        | Yes            |
| DDEAR              | Debug Data Effective Address register                 | 600        | R/W                     | Yes        | Yes            |
| DVC1U              | Data Value Compare 1 Upper                            | 601        | R/W                     | Yes        | No             |
| DVC2U <sup>4</sup> | Data Value Compare 2 Upper                            | 602        | R/W                     | Yes        | No             |
| DBCR6              | Debug control register 6                              | 603        | R/W                     | Yes        | Yes            |
| MAS0               | MPU assist register 0                                 | 624        | R/W                     | Yes        | Yes            |
| MAS1               | MPU assist register 1                                 | 625        | R/W                     | Yes        | Yes            |
| MAS2               | MPU assist register 2                                 | 626        | R/W                     | Yes        | Yes            |
| MAS3               | MPU assist register 3                                 | 627        | R/W                     | Yes        | Yes            |
| EDBRAC0            | External debug resource allocation control register 0 | 638        | Read only               | Yes        | Yes            |
| MPU0CFG            | MPU0 configuration register                           | 692        | Read-only               | Yes        | Yes            |
| DMEMCFG0           | Local Data Memory config register 0                   | 694        | Read-only               | Yes        | Yes            |
| L1FINV1            | L1 cache flush and invalidate control register 0      | 959        | R/W                     | Yes        | Yes            |
| DEVENT             | Debug Event register                                  | 975        | R/W                     | No         | Yes            |
| SIR                | System Information Register                           | 992        | Read-only               | No         | Yes            |

Table 7-2. Special Purpose Registers (continued)

| Mnemonic | Name                                             | SPR number | Access    | Privileged | e200z specific |
|----------|--------------------------------------------------|------------|-----------|------------|----------------|
| MPU0CSR0 | MPU0 configuration register                      | 1014       | R/W       | Yes        | Yes            |
| MMUCFG   | MMU/MPU configuration register                   | 1015       | Read-only | Yes        | Yes            |
| L1FINV0  | L1 cache flush and invalidate control register 0 | 1016       | R/W       | Yes        | Yes            |
| SVR      | System Version Register                          | 1023       | Read-only | Yes        | Yes            |

1. The Debug Status Register can be read using *mfscr RT,DBSR*. The Debug Status Register cannot be written to directly. Instead, bits in the Debug Status Register corresponding to '1' bits in GPR(RS) can be cleared using *mtscr DBSR,RS*.
2. Undefined on **POR** assertion, unchanged on **external PORESET (EXT\_POR\_B)** assertion.
3. The Machine Check Syndrome Register can be read using *mfscr RT,MCSR*. The Machine Check Syndrome Register cannot be written to directly. Instead, bits in the Machine Check Syndrome Register corresponding to '1' bits in GPR(RS) can be cleared using *mtscr MCSR,RS*.
4. The 64-bit DVC registers are accessed by using the DVC1 and DVC2 SPR numbers for the lower 32 bits and the DVC1U and DVC2U SPR numbers for the upper 32 bits.

### 7.2.3 Core reservation instructions

This device's core platform does not use reservation functionality. The core executes reservation instructions, but these instructions do not block other bus masters.

## 7.3 Platform Configuration Module (PCM)

The Platform Configuration Module contains miscellaneous configuration registers for the device. Currently, the configuration registers are related to the operation of the intelligent bus bridging gasket. The module is mapped to AIPS on-platform slot 10 with a base address of 0xFC02\_8000.

#### PCM memory map

| Address offset (hex) | Register name                                      | Width (in bits) | Access | Reset value | Section/page              |
|----------------------|----------------------------------------------------|-----------------|--------|-------------|---------------------------|
| 4                    | Bus Bridge Configuration Register 1 (PCM_IAHB_BE1) | 32              | R/W    | 0007_0707h  | <a href="#">7.3.1/179</a> |
| 8                    | Bus Bridge Configuration Register 2 (PCM_IAHB_BE2) | 32              | R/W    | 0007_0707h  | <a href="#">7.3.2/180</a> |
| C                    | Bus Bridge Configuration Register 3 (PCM_IAHB_BE3) | 32              | R/W    | 0000_0707h  | <a href="#">7.3.3/181</a> |

### 7.3.1 Bus Bridge Configuration Register 1 (PCM\_IAHB\_BE1)

This register, which must be accessed in supervisor mode, configures the bus bridge gasket for the DMA/SIPI/Ethernet port concentrator.

Address: 0h base + 4h offset = 4h

## 7.4 System modules

### 7.4.1 System Integration Unit Lite2 (SIUL2) configuration

The SIUL2 controls MCU reset configuration, pad configuration, external interrupt, general purpose I/O (GPIO), internal peripheral multiplexing, and the system reset operation. The reset configuration block contains the external pin boot configuration

logic. The pad configuration block controls the static electrical characteristics of I/O pins. The GPIO block provides uniform and discrete input/output control of the I/O pins of the MCU.

The SIUL2 provides the following features:

- Centralized pad control on per pin basis
- Pin function selection
- Configurable weak pull-up/down
- Configurable slew rate control
- Hysteresis on GPIO pins
- Configurable automatic safe mode pad control
- Input filtering for external interrupts with digital glitch filters

### 7.4.1.1 SIUL2 interrupts

The SIUL2 supports 32 external interrupts on this device.

The 32 external interrupt sources are grouped into 4 sets with 8 sources each. Each of the 4 groups is assigned one interrupt vector and mapped to the INTC. Each external interrupt source can be masked, and its status can be read individually. Glitch filters are implemented for each external interrupt source.

### 7.4.1.2 Reset values of MIDRn

The following table provides these registers' reset values.

**Table 7-3. MIDRn reset values**

| Register           |       | 144LQFP                | 257MAPBGA               |
|--------------------|-------|------------------------|-------------------------|
| MIDR1 <sup>1</sup> | 1N15P | 5744_3413h             | 5744_4013h <sup>2</sup> |
|                    | 1N65H | 5744_3412h             | 5744_4012h              |
| MIDR2              |       | 3900_5000h for MPC5744 | 3900_5000h for MPC5744  |
|                    |       | 3800_5000h for MPC5743 | 3800_5000h for MPC5743  |
|                    |       | 3200_5000h for MPC5742 | 3200_5000h for MPC5742  |
|                    |       | 3000_5000h for MPC5741 | 3000_5000h for MPC5741  |

1. The 5744h portion of the reset value applies for MPC5744P, MPC5743P, MPC5742P, and MPC5741P.

2. The reset value of the PKG field corresponds to a 208MAPBGA package because the 257MAPBGA package has 208 balls in its outer sections. The 257MAPBGA package has an additional 49 power and ground balls in an inner section.

## 7.4.2 Crossbar Switch Integrity Checker (XBIC) configuration

XBIC\_0 on this device supports the master and slave ports shown in [Table 7-4](#).

**Table 7-4. XBIC\_0 master and slave ports supported on this chip**

| Port type | Available port numbers |
|-----------|------------------------|
| Master    | 0, 1, 5, 6             |
| Slave     | 0, 2, 4, 5, 7          |

As a result, for XBIC\_0, the available fields in the MCR and ESR are as shown in [Table 7-5](#). The other fields are unused.

**Table 7-5. XBIC\_0 MCR and ESR field availability on this chip**

| Register | Available fields                                                                                          |
|----------|-----------------------------------------------------------------------------------------------------------|
| MCR      | ME0<br>ME1<br>ME5<br>ME6<br>SE0<br>SE2<br>SE4<br>SE5<br>SE7                                               |
| ESR      | DPME0<br>DPME1<br>DPME5<br>DPME6<br>DPSE0<br>DPSE2<br>DPSE4<br>DPSE5<br>DPSE7<br>MST<br>SLV<br>SYN<br>VLD |

XBIC\_1 supports the three masters connected to the 3-to-1 port concentrator.

**Table 7-6. XBIC\_1 connections**

| XBIC_1 port   | Connects to           |
|---------------|-----------------------|
| Master 2 (M2) | ENET                  |
| Master 1 (M1) | SIPI                  |
| Master 0 (M0) | DMA_0                 |
| Slave 0 (S0)  | AXBS module's M5 port |

As a result, for XBIC\_1, the available fields in the MCR and ESR are as shown in [Table 7-7](#). The other fields are unused.

**Table 7-7. XBIC\_1 MCR and ESR field availability on this chip**

| Register | Available fields                                             |
|----------|--------------------------------------------------------------|
| MCR      | ME0<br>ME1<br>ME2<br>SE0                                     |
| ESR      | DPME0<br>DPME1<br>DPME2<br>DPSE0<br>MST<br>SLV<br>SYN<br>VLD |

### 7.4.3 Crossbar Switch (XBAR) configuration

The multi-port Crossbar Switch concurrently supports up to 4 simultaneous connections between master ports and slave ports. It supports the AMBA AHB2.0 AHB-Lite protocol with AMBA V6 extensions for exclusive access support, extended cache control attributes, and misaligned data transfers (referred to as AHB2v6). The Crossbar Switch supports a 32-bit address bus width and a 32 or 64-bit data bus width at all master and slave ports. It also supports both address and data sideband signals which are used to implement decorated storage and the e2eECC for the MPC5744P. A flow-through design allows zero wait-state slave responses.

The Crossbar Switch provides the following features:

- Four master ports and five slave ports (see the following figure)

- 32-bit Address, 64-bit Data paths (applies to all ports) with misaligned access signaling
- Concurrent transfers between independent master and slave ports
- Programmable arbitration priorities on a per-slave port basis
- Round-robin arbitration available on a per-slave port basis
- Parking on slave ports: explicit master, park\_on\_last\_master, none (low power parking)

**Figure 7-1. Crossbar Switch Integration**

#### 7.4.3.1 High priority requests

Each slave on the Crossbar Switch has a CRS register with an HPE field for each master. When a particular HPE field is 1, the Crossbar Switch allows the corresponding master to send high priority requests.

However, not all masters are capable of enabling high priority requests. On this device, FlexRay is the only master that enables high priority requests. The modules that are assigned to the other physical master ports have CRSx[HPEn] fields, but those modules are not capable of enabling high priority requests.

### 7.4.3.2 Unimplemented PRS and CRS registers

These registers are not implemented because the corresponding slave ports (1, 3, and 6) of the Crossbar Switch are not connected:.

- PRS1, PRS3, and PRS6
- CRS1, CRS3, and CRS6

### 7.4.3.3 Reset value of PRS and CRS registers

The reset value of the Crossbar Switch's PRS registers is 0320\_0010h.

The reset value of the Crossbar Switch's CRS registers is 0000\_0000h.

### 7.4.3.4 Logical master IDs

The following table defines the logical master IDs used by the bus masters connected to the Crossbar Switch.

**Table 7-8. Logical master IDs**

| Master                                                                    | Logical master ID |
|---------------------------------------------------------------------------|-------------------|
| z4d_0 core complex Instruction port<br>z4d_0 core complex Load/Store port | 0                 |
| DMA                                                                       | 2                 |
| FlexRay                                                                   | 3                 |
| SIPI                                                                      | 4                 |
| Ethernet                                                                  | 5                 |
| z4d_0 core Nexus                                                          | 8                 |

### 7.4.3.5 Port allocation

The following table defines the master port allocation. The ports M2, M3, M4, and M7 are not connected.

**Table 7-9. Crossbar Switch master port allocation**

| Master port | Connected master                                            | Comments                            |
|-------------|-------------------------------------------------------------|-------------------------------------|
| M0          | z4d_0 core complex Instruction port                         |                                     |
| M1          | z4d_0 core complex Load/Store port<br>z4d_0 core Nexus port | Nexus also uses the Load/Store port |
| M5          | DMA/SIPI/Ethernet                                           | Output of the 3-to-1 concentrator   |
| M6          | FlexRay                                                     |                                     |

The following table defines the slave port connections. The ports S1, S3, and S6 are not connected.

**Table 7-10. Crossbar Switch slave port allocation**

| Slave port | Connected slave   | Comments                                                  |
|------------|-------------------|-----------------------------------------------------------|
| S0         | PFLASHC           | Platform Flash Memory Controller                          |
| S2         | PRAMC             | Platform SRAM Controller                                  |
| S4         | PBRIDGE0          | Peripheral Bridge #0                                      |
| S5         | PBRIDGE1          | Peripheral Bridge #1                                      |
| S7         | Data Local Memory | Backdoor access to Data Tightly Coupled Memory (Data TCM) |

#### 7.4.4 System Memory Protection Unit (SMPU) configuration

Memory protection isolates user and supervisor tasks through region descriptors that define access control rights. The device provides three layers of memory protection:

1. Processor core memory protection (CMPU) in the core, typically for the core's local memories (DMEM)
2. **System Memory Protection Unit (SMPU)** on the slave side of the crossbar switch
3. Peripheral access control registers (PACRs) for each address space slot in the PBRIDGE

For the second layer of memory protection, this device contains one instance of the SMPU.

The SMPU splits the physical memory into 16 different regions. Each master can be assigned different access rights to each region.

- 16 region MPU with concurrent checks against each master access
- 32 byte granularity for protected address region

See [Logical master IDs](#) for master assignments and [System Memory Protection Unit \(SMPU\)](#) for a detailed description of the module.

## 7.4.5 Peripheral Bridge configuration

The peripheral bridge (PBRIDGE or AIPS) modules are used to access the registers of most of the modules on this device.

### 7.4.5.1 Number of peripheral bridges

This device contains two identical peripheral bridge instances.

### 7.4.5.2 Memory maps

See the [Memory Map](#) for the memory slot assignment for each module.

### 7.4.5.3 MPRA register

Each Peripheral Bridge's MPRA register contains fields for each Crossbar Switch master on the chip.

The fields of the MPRA register apply to logical master IDs, not physical port numbers. The settings of MPRA's MTR0, MTW0, and MPL0 fields apply to both logical master 0 and logical master 8.

See [Logical master IDs](#) for the master ID assignments on this chip.

### 7.4.5.4 PACR/OPACR registers

The peripherals attached to the peripheral bridges each are assigned to a memory map slot that corresponds to a peripheral bridge register field. Every on-platform peripheral has an assigned PACRn field within the PACRA to PACRH registers, and every off-platform peripheral has an assigned OPACRn field within the OPACRA to OPACRAF registers.

The following tables provide the peripheral slot assignments for this device. Unused PACRn fields are reserved.

**Table 7-11. On-platform peripherals: PBRIDGE\_1**

| Peripheral | PACR |
|------------|------|
| PBRIDGE_1  | 0    |

**Table 7-12. Off-platform peripherals: PBRIDGE\_1**

| Peripheral                                 | OPACR |
|--------------------------------------------|-------|
| FlexPWM 0                                  | 255   |
| CTU 0                                      | 251   |
| ETIMER 0                                   | 247   |
| ETIMER 2                                   | 245   |
| SGEN 0                                     | 239   |
| SAR ADC 0                                  | 127   |
| SAR ADC 2                                  | 125   |
| SENT Receiver (SENT 1)                     | 104   |
| Deserial Serial Peripheral Interface 2     | 99    |
| Deserial Serial Peripheral Interface 3     | 98    |
| LIN Controller 0                           | 94    |
| Fault Collection and Control Unit          | 41    |
| Direct Memory Access Multiplexer 1         | 36    |
| Clock Monitor Unit for motor control clock | 18    |
| Clock Monitor Unit for SYS_CLK             | 18    |
| Clock Monitor Unit for Peripheral Bridge   | 18    |
| Clock Monitor Unit for ADC clock           | 18    |
| Clock Monitor Unit for SENT                | 18    |

**Table 7-13. On-platform peripherals: PBRIDGE\_0**

| Peripheral                      | PACR |
|---------------------------------|------|
| PBRIDGE_0                       | 0    |
| Crossbar 0                      | 1    |
| System Memory Protection Unit 0 | 4    |
| XBIC_0                          | 6    |
| Platform RAM Controller         | 8    |
| Platform Control Module         | 10   |
| Reserved                        | 11   |
| Platform Flash Controller       | 12   |
| XBIC_1                          | 13   |
| Interrupt Controller 0          | 16   |

### 7.4.5.5 PBRIDGE register reset values

The following table identifies reset values of PBRIDGE registers.

**Table 7-15. PBRIDGE register reset values**

| Register                                                       | PBRIDGE A   | PBRIDGE B   |
|----------------------------------------------------------------|-------------|-------------|
| MPRA                                                           | 0x7000_0000 | 0x7000_0000 |
| PACRA                                                          | 0x5400_4040 | 0x5000_0000 |
| PACRB                                                          | 0x4044_4400 | 0x0000_0000 |
| PACRC                                                          | 0x4000_4000 | 0x0000_0000 |
| PACRD                                                          | 0x0040_0004 | 0x0000_0000 |
| PACRF                                                          | 0x4000_4000 | 0x0000_0000 |
| PACRG                                                          | 0x0000_0000 | 0x0000_0000 |
| PACRH                                                          | 0x0000_0000 | 0x0000_0000 |
| OPACRA (OPACR0 to OPACR7) to<br>OPACRAF (OPACR248 to OPACR255) | 0x4444_4444 | 0x4444_4444 |

## 7.4.6 Interrupt Controller (INTC) configuration

This device contains one Interrupt Controller (INTC).

### 7.4.6.1 INTC number of processors and monitors

#### 7.4.6.1.1 Number of processors

The INTC on this chip supports one processor. It is designated processor 0 in the dedicated INTC chapter.

Any information about other processor core numbers in the INTC's chapter does not apply. For example, INTC register details for other processor core numbers are reserved on this chip.

#### 7.4.6.1.2 Interrupt Controller Monitor (INTCM)

The INTC on this chip supports one monitor because the chip has only one core. The INTCM monitors three interrupts.

### 7.4.6.2 Interrupt vector assignments

The following table defines the interrupt sources for the INTC on the device. All IRQ numbers that are not specifically listed are not used.

**Table 7-16. Interrupt vector table**

| Vector                 | Source signal                      | Source module           |
|------------------------|------------------------------------|-------------------------|
| Section A: on-platform |                                    |                         |
| 0                      | Software settable flag 0           | INTC (Software)         |
| 1                      | Software settable flag 1           | INTC (Software)         |
| 2                      | Software settable flag 2           | INTC (Software)         |
| 3                      | Software settable flag 3           | INTC (Software)         |
| 4                      | Software settable flag 4           | INTC (Software)         |
| 5                      | Software settable flag 5           | INTC (Software)         |
| 6                      | Software settable flag 6           | INTC (Software)         |
| 7                      | Software settable flag 7           | INTC (Software)         |
| 8                      | Software settable flag 8           | INTC (Software)         |
| 9                      | Software settable flag 9           | INTC (Software)         |
| 10                     | Software settable flag 10          | INTC (Software)         |
| 11                     | Software settable flag 11          | INTC (Software)         |
| 12                     | Software settable flag 12          | INTC (Software)         |
| 13                     | Software settable flag 13          | INTC (Software)         |
| 14                     | Software settable flag 14          | INTC (Software)         |
| 15                     | Software settable flag 15          | INTC (Software)         |
| 16 - 31                | Reserved                           |                         |
| 32                     | Platform software watchdog timeout | Software watchdog timer |
| 33 - 35                | Reserved                           |                         |
| 36                     | Platform periodic timer 0_0 (STM)  | STM                     |
| 37                     | Platform periodic timer 0_1 (STM)  | STM                     |
| 38                     | Platform periodic timer 0_2 (STM)  | STM                     |
| 39                     | Platform periodic timer 0_3 (STM)  | STM                     |
| 40 - 51                | Reserved                           |                         |
| 52                     | eDMA Combined Error                | eDMA                    |
| 53                     | eDMA Channel 0                     | eDMA                    |
| 54                     | eDMA Channel 1                     | eDMA                    |
| 55                     | eDMA Channel 2                     | eDMA                    |
| 56                     | eDMA Channel 3                     | eDMA                    |
| 57                     | eDMA Channel 4                     | eDMA                    |
| 58                     | eDMA Channel 5                     | eDMA                    |
| 59                     | eDMA Channel 6                     | eDMA                    |

### 7.4.6.3 INTC software vector mode and hardware vector mode

This information supplements and clarifies the information in these other locations:

- [Interrupt Vector Prefix Registers \(IVPR\)](#)
- [Software vector mode](#)
- [Hardware vector mode](#)

#### 7.4.6.3.1 Vector table alignment

On this chip, the vector table must be aligned to 64 KB.

#### 7.4.6.3.2 INTC software vector mode

In software vector mode, software—that is, the interrupt exception handler—reads an INTC register to obtain the vector associated with the interrupt request to the processor. The [INTC Interrupt Acknowledge Register for Processor 0 \(INTC\\_IACKR0\)](#) contains a 32-bit address composed of a vector table base address (VTBA) plus an offset that is the interrupt vector (INTVEC). The address is used to branch to the corresponding routine for that peripheral or software interrupt source.

The following figure shows a typical program flow for software vector mode.

**Figure 7-2. Software vector mode: program flow**

In software vector mode, hardware calculates a common interrupt exception handler address as shown in the following figure. The upper part of the Interrupt Vector Prefix Register (IVPR) is added to the Interrupt Vector Offset Register 4 (IVOR4) offset.

**Figure 7-3. Software vector mode: interrupt exception handler address calculation**

IVPR should be aligned to 256 bytes in software vector mode.

#### 7.4.6.3.3 INTC hardware vector mode

In hardware vector mode, no Interrupt Vector Offset Register (IVOR) is used.

The following figure shows a typical program flow for hardware vector mode.

Figure 7-4. Hardware vector mode: program flow

In hardware vector mode, hardware calculates the interrupt exception handler address as shown in the following figure.

Figure 7-5. Hardware vector mode: interrupt exception handler address calculation

IVPR should be aligned to 8 KB in hardware vector mode.

## 7.4.7 DMA Controller configuration

The peripheral DMA requests are serviced by a DMA controller. A static multiplexing scheme allows the support of more peripheral requests than available DMA channels.

The device implements two 32-channel DMA controllers: DMA\_0 and DMA\_1. They are located in different peripheral lakes at the same location in the memory map, for redundancy.

DMA\_1 is implemented in delayed lockstep using the same methodology as for the delayed lockstep of the cores:

- Only one DMA RAM array, which is accessed by DMA\_0 only for read and write accesses
- DMA\_1 is not visible to software. It cannot explicitly be accessed.
- DMA\_1 operates with a delay of 2 cycles compared to DMA\_0.
- The outputs of DMA\_0 and DMA\_1 are compared by RCCUs.
- The CORE\_1 and DMA\_1 are placed into the same lake.

For a comprehensive description of the DMA Controller, see its dedicated chapter.

### 7.4.8 DMAMUX configuration

This device contains two DMAMUX modules. DMAMUX\_0 connects directly to DMA channels 0-15. DMAMUX\_1 connects directly to DMA channels 16-31.

The DMAMUX does not generate any interrupt signals.

#### 7.4.8.1 DMAMUX trigger inputs

The following table defines the signal sources for the trigger support of the first #TRG channels of the DMAMUX module. The table is valid for both instantiations of the module, DMAMUX\_0 and DMAMUX\_1.

**Table 7-17. DMAMUX trigger sources**

| Source module | Source signal     | DMAMUX channel trigger # |
|---------------|-------------------|--------------------------|
| PIT           | Trigger channel 0 | 0                        |
| PIT           | Trigger channel 1 | 1                        |
| PIT           | Trigger channel 2 | 2                        |
| PIT           | Trigger channel 3 | 3                        |

#### 7.4.8.2 DMA request source slot mapping

The following tables define the mapping of the DMAMUX source slots to the interrupt request sources on the device.

Together, DMAMUX\_0 and DMAMUX\_1 support the total number of source slots documented in the dedicated DMAMUX chapter.

**Table 7-18. DMAMUX\_0 source slot mapping**

| DMAMUX source slot # | Source module    | Source resource |
|----------------------|------------------|-----------------|
| 1                    | DSPI_2           | DSPI_TFFF       |
| 2                    | DSPI_2           | DSPI_RFDF       |
| 3                    | DSPI_3           | DSPI_TFFF       |
| 4                    | DSPI_3           | DSPI_RFDF       |
| 5                    | CTU_0            | CTU             |
| 6                    | CTU_0            | FIFO1           |
| 7                    | CTU_0            | FIFO2           |
| 8                    | CTU_0            | FIFO3           |
| 9                    | CTU_0            | FIFO4           |
| 10                   | FlexPWM_0        | comp_val        |
| 11                   | FlexPWM_0        | capt            |
| 12                   | eTimer_0         | DREQ 0          |
| 13                   | eTimer_0         | DREQ 1          |
| 14                   | eTimer_0         | DREQ 2          |
| 15                   | eTimer_0         | DREQ 3          |
| 16                   | eTimer_2         | DREQ 0          |
| 17                   | eTimer_2         | DREQ 1          |
| 18                   | ADC_0            | DMA             |
| 19                   | ADC_2            | DMA             |
| 20                   | LINFlex_0        | Transmit        |
| 21                   | LINFlex_0        | Receive         |
| 22                   | SENT_1           | Fast message    |
| 23                   | SENT_1           | Slow message    |
| 24                   | Always requester | —               |
| 25                   | Always requester | —               |
| 26                   | Always requester | —               |
| 27                   | Always requester | —               |
| 28                   | Always requester | —               |
| 29                   | Always requester | —               |

**Table 7-19. DMAMUX\_1 source slot mapping**

| DMAMUX source slot # | Source module | Source resource |
|----------------------|---------------|-----------------|
| 1                    | DSPI_0        | DSPI_TFFF       |
| 2                    | DSPI_0        | DSPI_RFDF       |
| 3                    | DSPI_1        | DSPI_TFFF       |
| 4                    | DSPI_1        | DSPI_RFDF       |

*Table continues on the next page...*

**Table 7-19. DMAMUX\_1 source slot mapping (continued)**

| DMAMUX source slot # | Source module    | Source resource |
|----------------------|------------------|-----------------|
| 5                    | CTU_1            | CTU             |
| 6                    | CTU_1            | FIFO1           |

### 7.4.9 Error Injection Module (EIM) configuration

The EIM provides error injection for the DMA memory Error Correcting Code (ECC).

## 7.5 Clocking

See the Clocking chapter for a description of the architecture for system level clocks, including clock generation, clock sources, and peripheral clocks. The chapter also provides configuration details for the Clock Monitor Unit (CMU).

## 7.6 Memories and memory interfaces

See the chapters shown in the following table for detailed information about memories and memory interfaces.

**Table 7-20. Reference links to related information**

| Topic                            | Reference                      |
|----------------------------------|--------------------------------|
| Embedded memories                | Embedded memories              |
| System memory map                | Memory Map                     |
| Platform Flash Memory Controller | Flash Memory Controller        |
| Platform RAM Controller          | RAM Controller (PRAM)          |
| Embedded flash memory            | Embedded Flash Memory (c55fmc) |

### 7.6.1 RAM controller (PRAMC) configuration

#### 7.6.1.1 PRAMC optional read wait states

The following table shows programming values for the Pn\_BO\_DIS and FT\_DIS fields of the PRAMC's PRCR1 register and the resulting access timing for a WRAP4 burst. For additional information, see [Optional read wait-state](#).

**Table 7-21. Read wait states for WRAP4 burst**

| P0_BO_DIS or P1_BO_DIS | FT_DIS | WRAP4 timing |
|------------------------|--------|--------------|
| 0                      | 0      | 2/3-2-2-2    |
| 0                      | 1      | 3/4-2-2-2    |
| 1                      | 0      | 2/3-2-2-2    |
| 1                      | 1      | 3/4-4-4-4    |

Programming additional, optional wait states is not required except as needed for debug.

## 7.6.2 Flash Memory Controller (PFLASH) configuration

The flash controller provides flash configuration and control functions and manages the interface between the flash memory array and the crossbar switch. The configuration and control functions are accessed via control registers, which are read/write accessible only in supervisor mode.

Three of the registers, PFCR1, PFCR2, and PFAPR, control the interaction of master modules with the flash array by enabling/disabling prefetch or by controlling access to the flash array on a per-master basis.

Use of the fields in these registers requires knowledge of the number assigned to each master. For example, the PFAPR[M2AP] field controls flash array access by master 2, the PFAPR[M3AP] field controls flash array access by master 3, and so on. See [Logical master IDs](#) for master assignments.

### NOTE

ECC events encountered when the flash is in UTest mode are not subsequent to an externally-requested read operation. Margin Read and Array Integrity checks are strictly internal to the C55FMC flash and, as stated in the flash chapter, the results are combined by a MISR into a signature. ECC events during UTest activity are not reported externally to the flash.

See the PFCR3 register details in the flash memory controller chapter for more details on configuring the flash controller.

### 7.6.2.1 PFLASH interface to SRAM as overlay RAM

The PFLASH serves as the interface to the on-chip SRAM, which can be used as overlay RAM.

## 7.6.3 Embedded Flash Memory (c55fmc) configuration

### 7.6.3.1 C55FMC register reset values

The following table lists C55FMC register reset values that are specific to this chip. For the reset values of all other C55FMC registers, see [Memory map and register definition](#).

**Table 7-22. Chip-specific C55FMC register reset values**

| Register                                             | Reset value                             |
|------------------------------------------------------|-----------------------------------------|
| Extended Module Configuration Register (C55FMC_MCRE) | 0460_0802h <sup>1</sup>                 |
| Over-Program Protection 0 register (C55FMC_OPP0)     | See <a href="#">Flash OTP Control</a> . |
| Over-Program Protection 1 register (C55FMC_OPP1)     |                                         |
| Over-Program Protection 2 register (C55FMC_OPP2)     |                                         |
| Over-Program Protection 3 register (C55FMC_OPP3)     |                                         |

1. This value applies for MPC5744P, MPC5743P, MPC5742P, and MPC5741P.

### 7.6.3.2 C55FMC\_LOCK<sub>n</sub> register bit mapping

The C55FMC\_LOCK<sub>n</sub> registers provide a means to protect flash memory blocks from being modified. Each implemented bit in a C55FMC\_LOCK<sub>n</sub> register maps to a specific block.

#### 7.6.3.2.1 C55FMC\_LOCK0 register bit mapping

The flash memory blocks mapped to the [Lock 0 register \(C55FMC\\_LOCK0\)](#) bits are as follows.

|                | 0      | 1        | 2             | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16            | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27 | 28 | 29 | 30 | 31 |
|----------------|--------|----------|---------------|---|---|---|---|---|---|---|----|----|----|----|----|----|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

### 7.6.3.2.2 C55FMC\_LOCK1 register bit mapping

The flash memory blocks mapped to the [Lock 1 register \(C55FMC\\_LOCK1\)](#) bits are as follows.

|                         | 0        | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16             | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27 | 28 | 29 | 30 | 31 |

#### 7.6.3.2.3 C55FMC\_LOCK2 register bit mapping

The flash memory blocks mapped to the [Lock 2 register \(C55FMC\\_LOCK2\)](#) bits are as follows.

[illegible]

1. This block is reserved on MPC5741P, MPC5742P, and MPC5743P.
2. This block is reserved on MPC5741P and MPC5742P.
3. This block is reserved on MPC5741P.

#### 7.6.3.2.4 C55FMC\_LOCK3 register bit mapping

The flash memory blocks mapped to the [Lock 3 register \(C55FMC\\_LOCK3\)](#) bits are as follows.

|                |          |   |   |   |   |   |   |   |   |   |    |    |    |    |    |    |                 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|----------------|----------|---|---|---|---|---|---|---|---|---|----|----|----|----|----|----|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

### 7.6.3.4 C55FMC\_OPP $n$ register bit mapping

The C55FMC\_OPP $n$  registers provide a means to protect blocks from being over-programmed. Each implemented bit in a C55FMC\_OPP $n$  register maps to a specific memory block.

#### 7.6.3.4.1 C55FMC\_OPP0 register bit mapping

The flash memory blocks mapped to the [Over-Program Protection 0 register \(C55FMC\\_OPP0\)](#) bits are as follows.

|                | 0        | 1        | 2            | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16           | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27 | 28 | 29 | 30 | 31 |

### 7.6.3.4.2 C55FMC\_OPP1 register bit mapping

The flash memory blocks mapped to the [Over-Program Protection 1 register \(C55FMC\\_OPP1\)](#) bits are as follows.

|                         | 0        | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16            | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27                          | 28                          | 29                          | 30                          | 31                          |                             |
|-------------------------|----------|---|---|---|---|---|---|---|---|---|----|----|----|----|----|----|---------------|----|----|----|----|----|----|----|----|----|----|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|
| Register Field          | Reserved |   |   |   |   |   |   |   |   |   |    |    |    |    |    |    | HIGHOPP[15:0] |    |    |    |    |    |    |    |    |    |    |                             |                             |                             |                             |                             |                             |
| Flash Memory Block Name | —        | — | — | — | — | — | — | — | — | — | —  | —  | —  | —  | —  | —  | —             | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | 64 KB Block 5 - Partition 5 | 64 KB Block 4 - Partition 5 | 64 KB Block 3 - Partition 5 | 64 KB Block 2 - Partition 4 | 64 KB Block 1 - Partition 4 | 64 KB Block 0 - Partition 4 |

#### 7.6.3.4.3 C55FMC\_OPP2 register bit mapping

The flash memory blocks mapped to the **Over-Program Protection 2 register (C55FMC\_OPP2)** bits are as follows.

[illegible]

1. This block is reserved on MPC5741P, MPC5742P, and MPC5743P.
2. This block is reserved on MPC5741P and MPC5742P.
3. This block is reserved on MPC5741P.

#### 7.6.3.4.4 C55FMC\_OPP3 register bit mapping

The flash memory blocks mapped to the **Over-Program Protection 3 register (C55FMC\_OPP3)** bits are as follows.

|                |          |   |   |   |   |   |   |   |   |   |    |    |    |    |    |    |                |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|----------------|----------|---|---|---|---|---|---|---|---|---|----|----|----|----|----|----|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

## 7.6.4 Decorated Storage Memory Controller (DSMC) configuration

The DSMC supports five store and three load operations, including:

- Bit field inserts
- Compare-and-store
- Bitwise AND, OR, and XOR operators
- Simple memory load
- Swap
- Load-and-set-1(bit)

As the DSMC generates the atomic read-modify-write bus transactions to the attached slave memory controller, the two transactions (read, write) are fully pipelined with no idle cycles introduced. During these transactions, the AHB hlock control signal is asserted to the slave during the entire read-modify-write.

The module includes error checking logic that validates the decoration field, ensuring it is properly defined: all illegal commands are rejected and the transfer error is terminated. Additionally, the decorated storage memory controller only operates on aligned, single data transfers. Misalignment and/or bursts are not supported and, if attempted, are error terminated.

The DSMC is instantiated multiple times within the core platform and physically resides between the slave ports of the crossbar and the targeted memory controllers.

The device DSMC controllers are instantiated for SRAM, PBRIDGE\_0, and PBRIDGE\_1. The access size is forced to 64-bit for SRAM and 32-bit for the PBRIDGE modules.

## 7.7 Motor control configurations

This section provides information regarding various frequency combinations that can be used depending on the used case. The table shown below gives the valid CGM configurations for motor control subsystem.

**Table 7-23. Valid CGM configurations for motor control subsystem**

| Clock domain                  | Config 1                | Config 2                 | Config 3                 | Config 4                 |
|-------------------------------|-------------------------|--------------------------|--------------------------|--------------------------|
| SYS_CLK                       | PLL1_200 MHz            | PLL1_200 MHz             | PLL1_200 MHz             | PLL0_200 MHz             |
| AC0_DC0 (ADC aux clk divider) | PLL0_160 MHz            | PLL1_200/2 MHz = 100 MHz | PLL0_200/2 MHz = 100 MHz | PLL0_200/2 MHz = 100 MHz |
| AC0_DC2 (ADC aux clk divider) | PLL0_160/2 MHz = 80 MHz | PLL1_200/4 MHz = 50 MHz  | PLL0_200/4 MHz = 50 MHz  | PLL0_200/4 MHz = 50 MHz  |

Example used cases:

- For best ADC dynamic performance, it is recommended to run with single PLL supplying both system clock and motor control clocks (either PLL1 - Config 2 or PLL0 - Config 4).
- In case dual PLL configuration is required, run at a frequency where the clocks are harmonically related (Config - 3).
- Use Config - 1, i.e PLL1 with frequency modulation to improve EMC and PLL0 with frequency modulation for noise free usage of motor control peripherals and ADC or when Flexray with 80 MHz configuration is required.

## 7.8 Motor control modules

This section highlights the modules for motor control that are implemented on the device.

**Table 7-24. Motor control modules**

| Module or subsystem                                                       | Device-specific information                                        | Block details                                        |
|---------------------------------------------------------------------------|--------------------------------------------------------------------|------------------------------------------------------|
| Temperature sensor                                                        | Temperature sensor configuration                                   | Temperature Sensor                                   |
| ADC subsystem                                                             | ADC Configuration chapter                                          | See individual modules                               |
| Successive Approximation Register Analog-to-Digital Converters (SAR ADCs) | ADC Configuration chapter                                          | ADC Digital (ADCD)                                   |
| eTimer                                                                    | Enhanced Motor Control Timer (eTimer) configuration                | Enhanced Motor Control Timer (eTimer)                |
| FlexPWM                                                                   | Motor Control Pulse Width Modulator Module (FlexPWM) configuration | Motor Control Pulse Width Modulator Module (FlexPWM) |
| CTU                                                                       | Cross-Triggering Unit (CTU) configuration                          | Cross-Triggering Unit (CTU)                          |

## 7.8.1 Temperature sensor configuration

This device contains two Temperature Sensor modules, TSENS\_0 and TSENS\_1, located in different peripheral lakes.

The junction temperature sensor generates an output voltage that is directly proportional to the internal junction temperature of the device. The information provided by this sensor can be used to implement some intelligent power control (such as to reduce frequency when temperature is too high).

The mapping of the two temperature sensors to the ADC channels is defined in the ADC Configuration details. The temperature sensor has no input signals. Out of bounds detection of the chip temperature is handled via:

- A/D conversion of the analog values of both temperature sensors and software evaluation and software-initiated action on the results.
- FCCU failure generation according to the defined low and high temperature points.

### 7.8.1.1 Temperature sensor registers

The Power Management Controller (PMC) module provides registers controls for the temperature sensor modules. See the chapter dedicated to the PMC.

### 7.8.1.2 Temperature sensor bandgap reference

The analog portion of the PMC provides the bandgap reference for the temperature sensor modules.

## 7.8.2 Analog to Digital Converter (ADC) configuration

See [ADC Configuration](#).

## 7.8.3 Sine Wave Generator (SGEN) configuration

This chip implements one instance of the SGEN module, SGEN\_0.

## 7.8.4 Enhanced Motor Control Timer (eTimer) configuration

This device contains three eTimer modules: eTimer\_0, eTimer\_1, and eTimer\_2.

Each eTimer module comprises six 16-bit channels. All eTimer modules supports 5 Auxiliary Inputs. eTimer\_0 supports the watchdog timer function.

All eTimers have DMA support. eTimer\_0 has 4 DMA channels (channel 3,2,1,0). eTimer\_1 and eTimer\_2 each have 2 DMA channels (channel 1,0).

### 7.8.4.1 Required eTimer configuration before STOP mode entry

When ETIMER\_CHn\_CTRL3[STPEN] for an eTimer instance is 1: Before entering STOP mode, configure the eTimer to be stopped by programming MC\_ME\_PCTL137[LP\_CFG] (eTimer\_1), MC\_ME\_PCTL245[LP\_CFG] (eTimer\_2), or MC\_ME\_PCTL247[LP\_CFG] (eTimer\_0), as applicable, to select an MC\_ME\_LP\_PCn configuration where MC\_ME\_LP\_PCn[STOP0] is 0.

## 7.8.5 Motor Control Pulse Width Modulator (FlexPWM) configuration

This device contains two FlexPWM modules: FlexPWM\_0 and FlexPWM\_1.

The following table shows all signals connected to FlexPWM\_0 and FlexPWM\_1 input ports originating from other modules on the SoC for inter-module communication. See [CTU inter-module connections](#) for more details.

**Table 7-25. FlexPWM\_0 and FlexPWM\_1 module-to-module input signals**

| Source (output ports) |                               | Destination (input ports) |           |
|-----------------------|-------------------------------|---------------------------|-----------|
| Module name           | Port name                     | Module name               | Port name |
| eTimer_0              | T1                            | FlexPWM_0                 | EXT_FORCE |
| eTimer_1              | T1                            | FlexPWM_0                 | CLOCK     |
| eTimer_2              | T1                            | FlexPWM_1                 | EXT_FORCE |
| eTimer_2              | T3                            | FlexPWM_1                 | CLOCK     |
| FlexPWM_0             | Master Reload (local_reload0) | FlexPWM_1                 | EXT_SYNC  |

## 7.8.6 Cross-Triggering Unit (CTU) configuration

This device contains two CTU modules: CTU\_0 and CTU\_1.

### 7.8.6.1 CTU inter-module connections

The following figure shows the inter-module connection of the CTUs for the Motor Control related peripherals for the device.

Figure 7-6. CTU inter-module connections

### 7.8.6.2 TGSISR input assignments for CTU\_0 and CTU\_1

The following table identifies the alignment among the following:

- The input number used in the *InRE* and *InFE* fields of the CTU's register TGSISR
- The generic name used in the CTU chapter for the CTU input with that input number
- For both CTU\_0 and CTU\_1, the specific source on this device for the CTU input with that input number

**Table 7-26. Input assignments for CTU\_0\_TGSISR and CTU\_1\_TGSISR**

| Input | TGSISR fields   | CTU generic input name | CTU_0_TGSISR source     | CTU_1_TGSISR source     |
|-------|-----------------|------------------------|-------------------------|-------------------------|
| 0     | I0RE and I0FE   | PWM_REL                | FlexPWM_0 Master Reload | FlexPWM_1 Master Reload |
| 1     | I1RE and I1FE   | PWM_ODD_0              | FlexPWM_0 OUT_TRIG0_0   | FlexPWM_1 OUT_TRIG0_0   |
| 2     | I2RE and I2FE   | PWM_ODD_1              | FlexPWM_0 OUT_TRIG0_1   | FlexPWM_1 OUT_TRIG0_1   |
| 3     | I3RE and I3FE   | PWM_ODD_2              | FlexPWM_0 OUT_TRIG0_2   | FlexPWM_1 OUT_TRIG0_2   |
| 4     | I4RE and I4FE   | PWM_ODD_3              | FlexPWM_0 OUT_TRIG0_3   | FlexPWM_1 OUT_TRIG0_3   |
| 5     | I5RE and I5FE   | PWM_EVEN_0             | FlexPWM_0 OUT_TRIG1_0   | FlexPWM_1 OUT_TRIG1_0   |
| 6     | I6RE and I6FE   | PWM_EVEN_1             | FlexPWM_0 OUT_TRIG1_1   | FlexPWM_1 OUT_TRIG1_1   |
| 7     | I7RE and I7FE   | PWM_EVEN_2             | FlexPWM_0 OUT_TRIG1_2   | FlexPWM_1 OUT_TRIG1_2   |
| 8     | I8RE and I8FE   | PWM_EVEN_3             | FlexPWM_0 OUT_TRIG1_3   | FlexPWM_1 OUT_TRIG1_3   |
| 9     | I9RE and I9FE   | RPWM_0                 | FlexPWM_0 PWMX0         | FlexPWM_1 PWMX0         |
| 10    | I10RE and I10FE | RPWM_1                 | FlexPWM_0 PWMX1         | FlexPWM_1 PWMX1         |
| 11    | I11RE and I11FE | RPWM_2                 | FlexPWM_0 PWMX2         | FlexPWM_1 PWMX2         |
| 12    | I12RE and I12FE | RPWM_3                 | FlexPWM_0 PWMX3         | FlexPWM_1 PWMX3         |
| 13    | I13RE and I13FE | ETIMER1_IN             | eTimer_0 TO2            | eTimer_2 TO2            |
| 14    | I14RE and I14FE | ETIMER2_IN             | eTimer_1 TO2            | eTimer_2 TO5            |
| 15    | I15RE and I15FE | EXT_IN                 | External pin            | External pin            |

## 7.9 Timers

Three types of timers and a complex timer subsystem are implemented on the device.

**Table 7-27. Timers**

| Timer                          | Device-specific information                 | Block details                  |
|--------------------------------|---------------------------------------------|--------------------------------|
| System Timer Module (STM)      | System Timer Module (STM) configuration     | System Timer Module (STM)      |
| Software Watchdog Timer (SWT)  | Software Watchdog Timer (SWT) configuration | Software Watchdog Timer (SWT)  |
| Periodic Interrupt Timer (PIT) | PIT configuration                           | Periodic Interrupt Timer (PIT) |

*Table continues on the next page...*

**Table 7-27. Timers (continued)**

| Timer                                 | Device-specific information                         | Block details                         |
|---------------------------------------|-----------------------------------------------------|---------------------------------------|
| Enhanced Motor Control Timer (eTimer) | Enhanced Motor Control Timer (eTimer) configuration | Enhanced Motor Control Timer (eTimer) |

The master core has a dedicated System Timer Module (STM) and a dedicated Software Watchdog Timer (SWT).

### 7.9.1 System Timer Module (STM) configuration

This device contains one System Timer Module (STM).

The [STM chapter](#) states that the internal timer of the STM runs on the "system clock." On this chip, the STM's "system clock" is PBRIDGE<sub>EX</sub>\_CLK.

On this chip, STM\_CR resets to 0000\_0000h.

### 7.9.2 Software Watchdog Timer (SWT) configuration

This device contains one Software Watchdog Timer (SWT) module.

The internal timer of the SWT always runs on the IRCOSC clock.

The user must configure the outcomes of SWT time-out events by programming [ITR](#) in the [SWT\\_CR](#) as well as FCCU reactions to associated non-critical faults (NCFs):

- When SWT\_CR[ITR] is 0, any SWT time-out generates a reset request that corresponds to NCF[14].
- When SWT\_CR[ITR] is 1:
  - An initial time-out generates an interrupt request and triggers NCF[72].
  - A second consecutive time-out generates a reset request that corresponds to NCF[14].

#### CAUTION

To ensure that NCF[14] results in a reset, configure the FCCU's reaction to NCF[14] to be a long functional reset or short functional reset.

### 7.9.3 Periodic Interrupt Timer (PIT) configuration

This device contains one Periodic Interrupt Timer (PIT) module.

The PIT contains four 32-bit timer channels. Four channels are used as trigger timer for DMAMUX.

#### NOTE

For valid PIT clock frequency for this device please refer to [Figure 13-3](#) and [Table: Maximum system level clock frequencies](#).

## 7.10 Communication interfaces

### 7.10.1 FlexCAN configuration

This device contains three Controller Area Network (CAN) modules: FlexCAN\_0, FlexCAN\_1, and FlexCAN\_2. Each FlexCAN instantiation supports 64 Message Buffers.

Each FlexCAN module supports programmable clock source to the CAN Protocol Interface, either bus clock or crystal oscillator.

Each FlexCAN module sources 11 interrupt vectors.

Each FlexCAN module has one external output CAN\_Tx (CAN Transmit) and one external input CAN\_Rx (CAN Receive).

#### 7.10.1.1 FlexCAN interrupt flag ERRSR[CEIF]

The interrupt flag ERRSR[CEIF] does not have an assigned vector and does not generate an interrupt because the error it flags is corrected automatically. Nevertheless, ERRSR[CEIF] can be used as a status flag to report single-bit correctable memory errors.

### 7.10.2 LVDS Fast Asynchronous Transmission (LFAST) interface configuration

This device contains one LFAST interface.

The LFAST module is used to transfer data and control information between two devices (Master and Slave), and is capable of supporting either Dual mode (for example, configurable Master/Slave) or Slave-only mode functionality.

The serial link can run at up to 320 MBit/s using an LVDS physical layer. The following external signals are needed:

- One LVDS pair for Tx
- One LVDS pair for Rx
- Reference voltage pad
- Separate reference clock signal (not LVDS)

The LFAST Tx and Rx lines are connected to the pads via the SIUL2 and the MSCR registers. The Tx Data Port/Rx Data Port is connected to the SIPI module. The LFAST supports five interrupts.

The LFAST implementation includes a dedicated PLL for multiplying a low-speed clock source up to 320 MHz for the transmission and reception of data. The high-speed asynchronous nature of LFAST requires that both the local node and remote node operate from the same stable, low-jitter clock sources. This common low-speed clock is referred to as the Reference Clock.

### 7.10.3 Serial Peripheral Interface (SPI) configuration

This chip has four SPI module instances.

- None of the instances supports or uses these features:
  - Deserialization (DSI)
  - Global interrupt request line
- SPI\_0 and SPI\_1 each support 8 chip selects. SPI\_2 and SPI\_3 each support only 4 chip selects.

The terms SPI and DSPI are used interchangeably in this document.

### 7.10.4 FlexRay configuration

This device contains one dual channel FlexRay module with 64 configurable message buffers. The FlexRay module provides the following features:

- Protocol implementation compliant with FlexRay Communications System Protocol Specification, Version 2.1 Rev A
- Bus driver interface compliant with FlexRay Communications System Electrical Physical Layer Specification, Version 3.0
- Can be configured for single channel

- FlexRay Port A can be configured to be connected either to physical FlexRay channel A or physical FlexRay channel B
- Support for FlexRay bus data rates of 10 Mbit/s, 8 Mbit/s, 5 Mbit/s, and 2.5 Mbit/s

### 7.10.4.1 FlexRay interrupts

The FlexRay module provides seven individual interrupt sources and five combined interrupt sources. The following table describes all twelve interrupt sources.

- Eight interrupt sources are routed to the INTC.
- Two interrupt sources indicating correctable ECC errors of the local SRAM are combined (ORed) and then routed to the INTC. One of these two is also routed to the MEMU.
- Two interrupts indicating non-correctable ECC errors of the local SRAM are routed individually to the MEMU as well as combined (ORed) and routed to the INTC.

**Table 7-28. FlexRay interrupts**

| Interrupt name                             | Register field      | FlexRay module internal IRQ type | Connected to |
|--------------------------------------------|---------------------|----------------------------------|--------------|
| Receive FIFO Channel A Not Empty Interrupt | FNEAIF              | Individual                       | INTC         |
| Receive FIFO Channel B Not Empty Interrupt | FNEBIF              | Individual                       | INTC         |
| Wakeup Interrupt                           | WUPIF               | Individual                       | INTC         |
| Protocol Status and Error Interrupt        | PRIF                | Combined                         | INTC         |
| CHI Error Interrupt                        | CHIF                | Combined                         | INTC         |
| Transmit Message Buffer Interrupt          | TBIF                | Combined                         | INTC         |
| Receive Message Buffer Interrupt           | RBIF                | Combined                         | INTC         |
| Module Interrupt                           | MIF                 | Combined                         | INTC         |
| LRAM Correctable ECC Error Interrupt       | LRCEIF              | Individual                       | INTC         |
| DRAM Correctable ECC Error Interrupt       | DRCEIF <sup>1</sup> | Individual                       | INTC, MEMU   |
| LRAM Non-correctable ECC Error Interrupt   | LRNEIF              | Individual                       | INTC, MEMU   |
| DRAM Non-correctable ECC Error Interrupt   | DRNEIF <sup>2</sup> | Individual                       |              |

1. These two individual interrupt sources are combined (logical OR) before being routed to the interrupt controller.
2. These two individual interrupt sources are combined (logical OR) before being routed to the interrupt controller. They are routed individually to the MEMU.

### 7.10.4.2 FlexRay external signals

**Table 7-29. FlexRay external signals**

| Signal name | Direction | Signal description                            |
|-------------|-----------|-----------------------------------------------|
| FR_A_TX     | Output    | FlexRay Channel A Transmit                    |
| FR_A_TX_EN  | Output    | FlexRay Channel A Transmit Enable: active low |

*Table continues on the next page...*

**Table 7-29. FlexRay external signals (continued)**

| Signal name | Direction | Signal description                            |
|-------------|-----------|-----------------------------------------------|
| FR_A_RX     | Input     | FlexRay Channel A Receive                     |
| FR_B_TX     | Output    | FlexRay Channel B Transmit                    |
| FR_B_TX_EN  | Output    | FlexRay Channel B Transmit Enable: active low |
| FR_B_RX     | Input     | FlexRay Channel B Receive                     |
| FR_DBG[3:0] | Output    | Debug/Strobe Output (shared with GPIO)        |

### 7.10.5 SENT receiver (SRX) configuration

The Single Edge Nibble Transmission (SENT) module is designed as a receiver for transmitting sensor nodes using the SENT protocol (as documented by the SAE J2716 information report). SENT is a unidirectional communications scheme from a sensor (transmitting) device to a controller (receiving) device that does not include a coordination signal from the controller/receiving device.

This device contains two SENT modules. Each has two channels. The two modules are distributed to the two peripheral subsystems to allow redundancy for safety applications. The SENT has interrupts for slow and fast messages. There are two DMA requests per instantiated SENT module for the fast and slow messages. The SENT FIFO depth is 4.

The 5.0 V power supply required for a SENT interface is not provided by the MCU. This supply must be provided externally as shown in SAE J2716. As a result, the SENT has only one receive input pad per channel.

### 7.10.6 LINFlexD configuration

This device contains two LINFlex peripherals: LINFlex\_0 and LINFlex\_1. They are distributed between the two AIPS peripheral sub system for safety reasons.

The LINFlex module supports master and slave mode, contains one TX and one RX channel, and contains 16 identifier filtering in hardware.

Each LINFlex module can generate interrupts (RX, TX, Error). TX and RX have DMA channels.

The LINFlex baud rate clock is half the system clock. For example: When the system clock is 200 MHz, the LINFlex baud rate clock is 100 MHz.

## 7.10.7 Ethernet (ENET) configuration

The ENET module is connected to the eTimer modules. See the [CTU inter-module connections](#) diagram.

### NOTE

Before making any access to the Ethernet registers make sure the ENET module clock is enabled. If not, it is possible for the system to stall instead of generating a bus error.

The ENET module connects to external timer signals. See the Clocking chapter for details.

The ENET module's RMII\_CLK can be output on Port Pin G[8]. Along with configuring the SIUL2\_MSCR104 for selecting the ENET\_0[RMII\_CLK] function on Port Pin G[8], the user also needs to configure GCR[RMII\_CLK\_EN].

### 7.10.7.1 Generic Control Register (GCR)

|   |             |   |   |   |   |   |   |   |   |   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |             |    |          |    |    |    |    |    |
|---|-------------|---|---|---|---|---|---|---|---|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|----|----------|----|----|----|----|----|
|   | 0xFFC0_C000 |   |   |   |   |   |   |   |   |   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |             |    |          |    |    |    |    |    |

| 27 - 31<br>Reserved | This field is reserved.                                                                                                                                                                                                                                            |

## 7.11 Reset and boot modules

## 7.11.1 System Status and Configuration Module (SSCM) configuration

There is one SSCM instance in the device. The SSCM is part of the reset and boot subsystem.

### NOTE

UART and SCI are used interchangeably in the document beyond this point.

### 7.11.1.1 SSCM\_MEMCONFIG reset value

On the production-intent version of the chip, these MEMCONFIG fields have the indicated reset values:

- MREV: 2h
- JPIN: 2C5h

### 7.11.1.2 SSCM\_UOPS register and soc\_conf DCF client

On this device, two fields in the [SSCM\\_UOPS register](#) perform a specific function on the device. The other fields in the register are reserved.

The DCF client soc\_conf provides the value of the SSCM\_UOPS fields. For information about modifying soc\_conf, see [Device Configuration Format \(DCF\) Records](#).

The following table defines the two fields and shows their bit positions in both the register and the DCF client.

**Table 7-30. SSCM\_UOPS and soc\_conf fields**

| Field                     | SSCM_UOPS bit position | soc_conf bit position | Default value | Function of default value                               |
|---------------------------|------------------------|-----------------------|---------------|---------------------------------------------------------|
| Checker Core Enable (CCE) | 2                      | 31                    | 1             | Enables checker core <sup>1</sup>                       |
| Watchdog Enable (WDE)     | 0                      | 30                    | 0             | Enables watchdog automatically after device exits reset |

1. Turn off checker core for power saving or debug

### 7.11.1.3 UTEST\_OFFSET location

On this device, the UTEST\_OFFSET location at which the SSCM looks for UTEST DCF records is 0040\_0200h.

### 7.11.1.4 SSCM\_ERROR[RAE] exception not produced for some modules

Setting [RAE](#) in the [SSCM Error Configuration Register \(SSCM\\_ERROR\)](#) to 1 produces a Prefetch or Data Abort exception for illegal accesses to most off-platform peripherals.

However, for a subset of off-platform peripherals, illegal accesses to unimplemented spaces in the peripherals' memory maps do not produce a Prefetch or Data Abort exception. This subset includes the CMUs, SIPI, FCCU and CTU.

### 7.11.1.5 SSCM boot locations in flash memory

[Table 5-4](#) identifies the boot locations in flash memory that contain a valid RCHW record.

## 7.12 Safety modules

### 7.12.1 CRC configuration

The value of the parameter CRC\_CNTX\_NUM, which defines the number of application contexts and therefore the number of instances of CRC registers, is 3.

### 7.12.2 Memory Error Management Unit (MEMU) configuration

The following diagram shows the data flow of the various Error Correction Code logic used for the Flash, System RAM and the Peripheral RAMs.

**Figure 7-7. MEMU System Connections**

### 7.12.2.1 Error sources for Concurrent Overflow (OFLWn) registers

The three categories of error reporting for the MEMU are:

- System RAM error reporting: Any RAM that is CPU accessible falls into this category.
- Peripheral RAM error reporting: Any RAM that is not CPU accessible falls into this category.
- Flash error reporting

In an overflow condition, it is possible to identify the unique error source that caused the overflow. Corresponding error sources for the OFLWn register details the corresponding error source to the respective field in the Concurrent Overflow registers.

**Table 7-31. Corresponding error sources for OFLWn registers**

| Memory          | Memory Classification | ECC: Single Error Correcting (SEC) or Double Error Detecting (DED) | OFLW register: <bit position> |
|-----------------|-----------------------|--------------------------------------------------------------------|-------------------------------|
| Core 0          |                       |                                                                    |                               |
| Core D-MEM CPU0 | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 0     |
| Core I-Cache    | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 1     |

*Table continues on the next page...*

**Table 7-31. Corresponding error sources for OFLWn registers (continued)**

| Memory                    | Memory Classification | ECC: Single Error Correcting (SEC) or Double Error Detecting (DED) | OFLW register: <bit position> |
|---------------------------|-----------------------|--------------------------------------------------------------------|-------------------------------|
| Core D-Cache <sup>1</sup> | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 2     |
| I-AHB E2E ECC             | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 3     |
| D-AHB E2E ECC             | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 4     |
| Platform                  |                       |                                                                    |                               |
| PRAM E2E ECC              | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 5     |
| FlexRay E2E ECC           | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 6     |
| PBRIDGE0 E2E ECC          | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 7     |
| PBRIDGE1 E2E ECC          | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 8     |
| DMA E2E ECC               | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 9     |
| SIPI E2E ECC              | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 10    |
| D-TCM Backdoor E2E ECC    | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 11    |
| DSMC PRAM E2E ECC         | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 12    |
| DSMC PBRIDGE0 E2E ECC     | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0: bit 13    |
| DSMC PBRIDGE1 E2E ECC     | System RAM            | SEC/DED                                                            | MEMU_SYS_RAM_OFLW0 : bit 14   |
| FlexRay                   |                       |                                                                    |                               |
| FlexRay DRAM              | Peripheral RAM        | SEC/DED                                                            | MEMU_PERIPH_RAM_OFLW0: bit 0  |
| FlexRay LRAM              | Peripheral RAM        | Error Detection Code (EDC) Only                                    | MEMU_PERIPH_RAM_OFLW0: bit 1  |
| FlexCAN                   |                       |                                                                    |                               |

| DMA                       | Peripheral RAM        | SEC/DED                                                            | MEMU_PERIPH_RAM_OFLW0: bit 5  |
| Flash                     |                       |                                                                    |                               |
| Flash                     | Flash                 | SEC/DED                                                            | MEMU_FLASH_OFLW0: bit 0       |

1. Cache tag errors can be single-bit or double-bit. Cache data array errors are reported as single-bit errors only, regardless of the number of errors reported, since the logic does not exist in the cache to distinguish them.

### 7.12.2.2 Uncorrectable error in flash memory can cause uncorrectable error in SRAM

Be aware of the following scenario where an uncorrectable error in flash memory can cause an uncorrectable error in SRAM to be reported. Each error triggers a separate FCCU response.

1. An uncorrectable error in flash memory occurs, and C55FMC\_MCR[EER] sets to 1.
2. MEMU\_FLASH\_UNCERR\_STS[VLD] sets to 1, and  
MEMU\_ERR\_FLAG[F\_UCE] sets to 1.  
MEMU\_FLASH\_UNCERR\_ADDR[ERR\_ADD] records the address on which the error was detected.
3. The FCCU responds to a fault on NCF[22].

When the core register field E2ECTL0[DECCEN] is 1, these events follow:

1. The detected error in flash memory results in an exception/machine check.
2. MEMU\_SYS\_RAM\_UNCERR\_STS[VLD] sets to 1, and  
MEMU\_ERR\_FLAG[SR\_UCE] sets to 1.  
MEMU\_SYS\_RAM\_UNCERR\_ADDR[ERR\_ADD] records the address on which the error was detected.
3. The FCCU responds to a fault on NCF[16].

### 7.12.2.3 FlexCAN RAM error address must be shifted left twice

When a correctable or uncorrectable error occurs in a FlexCAN module's peripheral RAM, the error address captured in the MEMU\_PERIPH\_RAM\_CERR\_ADDRn or MEMU\_PERIPH\_RAM\_UNCERR\_ADDRn register is incorrect. Shift the captured address left twice to determine the actual address.

## 7.12.3 Fault Collection and Control Unit (FCCU) configuration

### 7.12.3.1 Fault inputs

[Table 7-33](#) shows the source of the fault signals and the type of fault input to which these signals are connected at the FCCU..

All faults are marked as non-critical faults (NCF) input at the FCCU. FCCU can set reaction of each faults as critical or non-critical faults reaction. Unmasked faults with the time-out disabled are treated like critical faults by the FCCU. [Table 7-32](#) explains the conventions used in the "Set/Clear injection" column of [Table 7-33](#).

**Table 7-32. Set/Clear injection conventions**

| Convention        | Explanation                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------|
| —                 | Set/clear is not supported by writing to FCCU NCF Fake Register (FCCU_NCFF)                                                 |
| Clear             | Can be cleared only, not set, by writing to FCCU NCF Fake Register (FCCU_NCFF)                                              |
| X                 | Can be set and cleared by writing to FCCU NCF Fake Register (FCCU_NCFF)                                                     |
| X (by ADC itself) | Can be set/cleared by writing to STCR2[SERR] of the applicable ADC instead of writing to FCCU NCF Fake Register (FCCU_NCFF) |
| X (by PMC itself) | Can be set/cleared by writing to the applicable bit of PMC_FIR instead of writing to FCCU NCF Fake Register (FCCU_NCFF)     |

**Table 7-33. FCCU Non-Critical Faults Mapping**

| Non-Critical Fault | Source              | Signal Description                                                                                                                    | Set/Clear injection <sup>1</sup> | Fault enabled | Time-out enabled |

| NCF[32]              | SIUL2                            | Error input pin of this device. Because of the lack of a dedicated pin for this purpose, SIUL2 External Interrupt_0 can be used to indicate if any other MCU is going into Error state. Note: If interrupt is configured as the reaction of this NCF then the interrupt controller may observe two interrupts one due to FCCU and another due to the SIUL IRQ[0]. So, appropriate configuration must be done. | —                                | X             | X                |
| NCF[33]              | PFLASH and embedded flash memory | Address Encode Error ORed with voltage and current error of flash memory array.                                                                                                                                                                                                                                                                                                                               | Clear                            | X             | X                |

| NCF[74]            | FCCU DCF     | Misconfiguration of error_out pin interface of the FCCU after reset (overwriting the respective configuration bits resolves this error)          | —                                | X             | X                |

1. See [Table 1](#) for an explanation of this column's contents.
2. Function not available on module
3. This fault is not generated in debug mode because the RCCUs are disabled in debug mode. See [Core lockstep and RCCU disablement in debug mode](#) for more information.
4. Always configure the FCCU reaction to NCF[14] as a short or long functional reset. Never configure it as an interrupt.
5. Always configure the FCCU reaction to NCF[26] as a short or long functional reset. Never configure it as an interrupt.
6. If RCCUs are disabled due to entry to debug mode, this fault is not triggered. If RCCU disablement occurs for another reason, this fault is triggered. See [Core lockstep and RCCU disablement in debug mode](#) for more information about RCCU disablement in debug mode.

### NOTE

Functional reset is not generated by any of the fault by default (after reset).

#### 7.12.3.2 EOUT[0:1] and FCCU\_F[0:1] signals

The external signals generated by the FCCU have different names at the module level and the chip level. They are named:

- EOUT[0:1] (fcc\_eout[0:1]) at the module level, such as in the dedicated FCCU chapter.
- FCCU\_F[0:1] at the chip level, such as in the Signal Description chapter.

### 7.12.3.3 FCCU chip-specific register reset values

This table lists in alphabetical order by mnemonic the FCCU registers whose reset values are specific to this chip. (The reset values for all other FCCU registers are specified in [Register descriptions](#).)

| Register       | Reset value                                         |
|----------------|-----------------------------------------------------|
| FCCU_CFG       | Loaded from <a href="#">FCCU record</a> after reset |
| FCCU_CFG_TO    | 0000_0006h                                          |
| FCCU_NCF_CFG0  | FFFF_FFFFh                                          |
| FCCU_NCF_CFG1  | FF7F_FFFFh                                          |
| FCCU_NCF_CFG2  | 0000_07FFh                                          |
| FCCU_NCF_E0    | FFFF_FFFFh                                          |
| FCCU_NCF_E1    | 0778_003Fh                                          |
| FCCU_NCF_E2    | 0000_0720h                                          |
| FCCU_NCF_TO    | 0000_FFFFh                                          |
| FCCU_NCF_TOE0  | FFFF_FFFFh                                          |
| FCCU_NCF_TOE1  | FF7F_FFFFh                                          |
| FCCU_NCF_TOE2  | 0000_07FFh                                          |
| FCCU_NCFS_CFG0 | 0000_0000h                                          |
| FCCU_NCFS_CFG1 | 0000_0000h                                          |
| FCCU_NCFS_CFG2 | 0000_0000h                                          |
| FCCU_NCFS_CFG3 | 0000_0000h                                          |
| FCCU_NCFS_CFG4 | 0000_0000h                                          |

### 7.12.3.4 FCCU chip-specific glitch-filter guidelines

In this chip, the FCCU glitch filter is assigned to the NCF1 channel; however, this channel is tied low instead of being connected to a pin on the boundary of the chip.

Ignore the FCCU\_CTRL[FILTER\_BYPASS] and FCCU\_CTRL[FILTER\_WIDTH] fields because they have no effect on anything.

### 7.12.3.5 FCCU\_STAT[PhysicErrorPin] reset value

The reset value of the FCCU\_STAT[PhysicErrorPin] depends on the current state of the physical error pin. The value also depends on the selected protocol. See [EOUT interface](#).

### 7.12.3.6 FOSU\_COUNT value

The FCCU Output Supervision Unit (FOSU) has a timer whose duration is the value FOSU\_COUNT. On this chip, the value is 65,535 IRCOSC clock cycles.

### 7.12.3.7 Error signal flow diagram

\* This condition must be satisfied only when FCCU is configured for Bistable fault-output mode (FCCU\_CFG[FOM]).

**Figure 7-8. Error signal flow**

## 7.12.4 Self-Test Control Unit (STCU2) configuration

See the [Self-Test Control Unit \(STCU2\)](#) details.

## 7.12.5 Register protection (REG\_PROT) configuration

### 7.12.5.1 List of protected registers

An appendix of this document provides a comprehensive list of protected registers on the device.

## 7.13 Debug

The device provides Nexus with Reduced Port Mode (RPM) and the Aurora interface (FPM) for debug access.

The Aurora interface allows the Nexus protocol information to be transmitted serially at a high rate of speed over two Aurora lanes.

See the [Debug](#) details for more information.

**Table 7-34. PRN for existing Masksets**

| Maskset name | Part Revision Number(PRN) |
|--------------|---------------------------|
| 1N15P        | "0x3"                     |
| 1N65H        | "0x1"                     |

## 7.14 Wakeup Unit (WKPU) configuration

The WKPU outputs an NMI source signal that triggers an interrupt connected to the NMI input of the FCCU, which generates a core wakeup signal if the chip is in stop mode or provides an NMI in all other cases.

### 7.14.1 Chip-specific WKPU register reset values

The following table lists WKPU register reset values that are specific to this chip.

**Table 7-35. Chip-specific WKPU register reset values**

| Register | Reset value | Notes                     |
|----------|-------------|---------------------------|
| NCR      | 0000_0000h  | NDSS0 field resets to 00b |

# Chapter 8

## Reset

### 8.1 Introduction

The chapter describes the global and local reset behavior of the device.

#### 8.1.1 Global Reset

The global reset behavior refers to device reset behavior controlled by the MC\_RGM which affects several modules of the device at the same time. The global reset is linked to the reset process described in Section 8.2, Global Reset Process.

#### 8.1.2 Local Reset

The local reset behavior refers to module reset behavior controlled by the MC\_RGM or dedicated modules which affects only one module at a time. Local resets are described in the module chapters.

### 8.2 Global Reset Process

This section describes the global reset process. Throughout this section the term *global* is omitted.

#### 8.2.1 Overview

The global reset process is a sequence of several reset phases. Each reset phase has a specific entry condition, a specific exit condition, and a specific device reset behavior, which is different among the reset phases. The reset phases are executed in a specific

order, thus building the actual global reset process. There are several modules contributing to the global reset process. All modules of the device can be affected by the global reset process.

## 8.2.2 Reset Process Modules

All modules which can enter, gate, or control the reset process are listed in [Table 8-1](#) together with their type of contribution. The types of contribution are described in [Table 8-2](#).

**Table 8-1. Reset Process Modules**

| Module                                                         | Contribution Type |        |         |
|----------------------------------------------------------------|-------------------|--------|---------|
|                                                                | event             | gating | control |
| Section 8.2.2.1, Reset Generation Module (MC_RGM)              | v                 | v      | v       |
| Section 8.2.2.2, Power Management Controller (PMC)             | v                 | v      | v       |
| Section 8.2.2.3, Mode Entry Module (MC_ME)                     | v                 |        |         |
| Section 8.2.2.4, System Status and Configuration Module (SSCM) |                   | v      |         |
| Section 8.2.2.5, Self-Test Control Unit (STCU)                 |                   |        | v       |
| Section 8.2.2.6, Fault Collection and Control Unit (FCCU)      | v                 | v      |         |
| Section 8.2.2.7, Embedded Flash Memory (c55fmc)                | v                 | v      |         |
| Section 8.2.2.8, JTAG Controller (JTAGC)                       | v                 |        |         |

**Table 8-2. Module Contribution Type**

| Contribution Type | Description                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| event             | The module may generate events which may trigger the entry into an reset state, if the event configuration in the MC_RGM allows this. |
| gating            | The module can prevent the exit of a reset state if it has not reached a certain internal state.                                      |
| control           | The module controls the sequence of the reset process.                                                                                |

### 8.2.2.1 Reset Generation Module (MC\_RGM)

The MC\_RGM is one of three controlling modules for the reset process. The MC\_RGM can receive events from other modules and starts the reset process based on the configuration for these events. The event configuration defines the reset phase at which the reset process starts. The MC\_RGM also controls the reset process sequence based on the gating information it receives from the gating modules.

### 8.2.2.2 Power Management Controller (PMC)

The PMC provides two types of signals for the reset process control.

As long as the supply voltages are not reliable, the PMC provides signals to put the whole device into a power on reset state.

As long as the supply voltages are reliable but above or below certain operational limits, the PMC provides signals to allow the device to enter the reset process.

### 8.2.2.3 Mode Entry Module (MC\_ME)

The MC\_ME can generate events to enter the reset process. These events can be triggered only by application software.

### 8.2.2.4 System Status and Configuration Module (SSCM)

The SSCM is started automatically during a specific phase of the reset process. The SSCM fetches DCF records from the flash memory and distributes the read values via an internal DCF bus to the related modules. As long as the SSCM is still fetching DCF records, this specific reset phase cannot be exited.

### 8.2.2.5 Self-Test Control Unit (STCU)

The STCU controls the execution of the startup and shutdown self-test. Depending on its configuration, the STCU is started when PHASE3[DEST] is exited or when software triggers the self-test. The STCU generates a functional event when the self-testing has been completed.

### 8.2.2.6 Fault Collection and Control Unit (FCCU)

The FCCU generates reset events and gates the reset process while it is configuring itself based on the DCF record content.

The FCCU's FOSU also generates a reset event when a fault occurs but the FCCU fails to react to that fault.

### 8.2.2.7 Embedded Flash Memory (c55fmc)

Failure of flash memory initialization, which generates a reset event and gates the reset process, usually results from misconfigured data for self-test or trimming.

### 8.2.2.8 JTAG Controller (JTAGC)

JTAGC TAP controller generates this event to allow the external debugger to reset the SoC via a JTAG command (such as JTAG EXTTEST) without using the external RESET\_B pin.

## 8.2.3 Reset Process Sequence

This section specifies the reset process sequence. An overview of the reset process sequence appears in the following figure. When the reset process has reached the IDLE state, the device is operational.

Figure 8-1. Reset Process Sequences

## 8.2.4 Reset Process State Transitions

This section specifies the transitions between the reset states in the reset process. For each state, the state entry, the state execution, and the state exit are described.

### 8.2.4.1 POWERUP

### 8.2.4.1.1 POWERUP State Entry

This state is entered from any state if at least one of the following events occurs:

- Power is applied to the unpowered device.
- PMC has detected a low power condition that is lower than the minimum operating voltage
- EXT\_POR\_B pin is driven low

### 8.2.4.1.2 POWERUP State Execution

During this state the PMC is waiting for stable power supply.

All output PADs are driven to known values, and all bidirectional PADs are configured as inputs.

### 8.2.4.1.3 POWERUP State Duration

There are no bounds on the duration of this state.

### 8.2.4.1.4 POWERUP State Exit

**Table 8-3. POWERUP Next State Table**

| Next State | Condition                                                                                                         | Process/Module Started at Exit |
|------------|-------------------------------------------------------------------------------------------------------------------|--------------------------------|
| PHASE0     | (1) The EXT_POR_B pin is high<br>and<br>(2) the PMC module indicates all<br>supplies are in the operational range | IRCOSC<br>MC_RGM               |

## 8.2.4.2 PHASE0

### 8.2.4.2.1 PHASE0 State Entry

This state can be entered from

- all other reset states when the state exit condition is present.

### 8.2.4.2.2 PHASE0 State Execution

All trimming bits are reset to their default values.

All output PADs are driven to known values, and all bidirectional PADs are configured as inputs.

### 8.2.4.2.3 PHASE0 State Exit

Table 8-4. PHASE0 Next State Table

| Next State   | Condition                                                                                                                                                                                                                                                   | Process/Module Started at Exit |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| PHASE1[DEST] | (1) The MC_RGM indicates that all sources of enabled destructive reset events are deasserted,<br>and<br>(2) the IRCOSC module indicates the generation of a stable clock,<br>and<br>(3) the PMC module has <b>deasserted</b> <i>dpmc_rgm_phase0_lvd_b</i> . |                                |

### 8.2.4.3 PHASE1[DEST]

#### 8.2.4.3.1 PHASE1[DEST] State Entry

This state can be entered from state

- PHASE0,
- PHASE1[FUNC],
- PHASE2[FUNC],
- PHASE3[FUNC],
- IDLE.

#### 8.2.4.3.2 PHASE1[DEST] State Execution

There are no state changes in any module; only a counter in the MC\_RGM is running.

#### 8.2.4.3.3 PHASE1[DEST] State Exit

Table 8-5. PHASE1[DEST] Next State Table

| Next State | Condition                                                                                  | Process/Module Started at Exit |
|------------|--------------------------------------------------------------------------------------------|--------------------------------|
| PHASE0     | The MC_RGM has detected that the source of an enabled destructive reset event is asserted. |                                |

*Table continues on the next page...*

**Table 8-5. PHASE1[DEST] Next State Table (continued)**

| Next State   | Condition                                    | Process/Module Started at Exit                                                                                                                                                         |
|--------------|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PHASE2[DEST] | 8 IRCOSC clocks passed by after state entry. | FLASH<br>- starts initialization sequence<br>FCCU<br>- enters configuration state in preparation for receiving DCF record content<br>STCU<br>- waits for configuration via DCF records |

#### 8.2.4.4 PHASE2[DEST]

##### 8.2.4.4.1 PHASE2[DEST] State Entry

This state can be entered from state

- PHASE1[DEST].

##### 8.2.4.4.2 PHASE2[DEST] State Execution

FLASH executes an initialization sequence for slow array access.

##### 8.2.4.4.3 PHASE2[DEST] State Exit

**Table 8-6. PHASE2[DEST] Next State Table**

| Next State   | Condition                                                                                  | Process/Module Started at Exit                                 |
|--------------|--------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| PHASE0       | The MC_RGM has detected that the source of an enabled destructive reset event is asserted. |                                                                |
| PHASE3[DEST] | The FLASH module indicates the availability of slow array access.                          | SSCM<br>- starts device configuration and boot location search |

#### 8.2.4.5 PHASE3[DEST]

##### 8.2.4.5.1 PHASE3[DEST] State Entry

This state can be entered only from state

- PHASE2[DEST].

### 8.2.4.5.2 PHASE3[DEST] State Execution

SSCM runs device configuration and boot location search.

The FCCU executes its configuration sequence.

The PMC adjusts its LVD and HVD levels according to the DCF record content, adjusts its output to the full voltage level, and executes its self-test.

The FLASH transitions from slow to full speed array access when full voltage has been achieved by the PMC.

### 8.2.4.5.3 PHASE3[DEST] State Exit

**Table 8-7. PHASE3[DEST] Next State Table**

| Next State | Condition                                                                                                                                                                                                                                                                                                                                                                                     | Process/Module Started at Exit               |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| PHASE0     | The MC_RGM has detected that the source of an enabled destructive reset event is asserted.                                                                                                                                                                                                                                                                                                    |                                              |
| SELFTEST   | (1) The FLASH module indicates availability of full speed array access,<br>and<br>(2) the SSCM module indicates device configuration is done,<br>and<br>(3) the FCCU module indicates it has completed its configuration sequence,<br>and<br>(4) the PMC module indicates it has finished its internal self-test,<br>and<br>(5) the STCU module is configured to execute a startup self-test. | BIST on<br>- FCCU<br>- CORE<br>- PERIPHERALS |
| IDLE       | (1) the FLASH module indicates availability full speed array access,<br>and<br>(2) the SSCM module indicates device configuration is done,<br>and<br>(3) the FCCU module has completed its configuration sequence,<br>and<br>(4) the PMC module indicates it has finished its internal self-test.                                                                                             | CORE<br>ALL OTHER PERIPHERALS                |

## 8.2.4.6 SELFTEST

### 8.2.4.6.1 SELFTEST State Entry

This state can be entered only from state

- PHASE3[DEST],
- IDLE.

### 8.2.4.6.2 SELFTEST State Execution

SELFTEST is running on FCCU, CORE, PERIPHERALS.

### 8.2.4.6.3 SELFTEST State Exit

**Table 8-8. SELFTEST Next State Table**

| Next State   | Condition                                                                                  | Process/Module Started at Exit |
|--------------|--------------------------------------------------------------------------------------------|--------------------------------|
| PHASE0       | The MC_RGM has detected that the source of an enabled destructive reset event is asserted. |                                |
| PHASE1[FUNC] | STCU module indicates end of self test.                                                    |                                |

## 8.2.4.7 PHASE1[FUNC]

### 8.2.4.7.1 PHASE1[FUNC] State Entry

This state can be entered from states

- SELFTEST
- PHASE3[FUNC]
- IDLE.

### 8.2.4.7.2 PHASE1[FUNC] State Execution

There are no state changes in any module; only a counter in the MC\_RGM is running.

### 8.2.4.7.3 PHASE1[FUNC] State Duration

The duration of this state is 8 IRCOSC clock cycles.

### 8.2.4.7.4 PHASE1[FUNC] State Exit

**Table 8-9. PHASE1[FUNC] Next State Table**

| Next State   | Condition                                                                                                                                                                                                                                                                                                                  | Process/Module Started at Exit                                                                                                                                                               |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PHASE0       | The MC_RGM has detected that the source of an enabled destructive reset event is asserted.                                                                                                                                                                                                                                 |                                                                                                                                                                                              |
| PHASE1[DEST] | When self test is enabled: The MC_RGM has detected that the source of the enabled long functional reset event is asserted, and the source is an external reset.                                                                                                                                                            |                                                                                                                                                                                              |
| PHASE1[FUNC] | The MC_RGM has detected that the source of the enabled long functional reset event is asserted, and the source is not an external reset.<br><br>or<br><br>When self test is disabled: The MC_RGM has detected that the source of the enabled long functional reset event is asserted, and the source is an external reset. |                                                                                                                                                                                              |
| PHASE2[FUNC] | (1) The MC_RGM indicates that all sources of enabled long functional reset events are deasserted,<br><br>and<br><br>(2) 8 IRCOSC clocks passed by after state entry.                                                                                                                                                       | FLASH<br>- starts initialization sequence<br><br>- enters configuration state in preparation for receiving DCF record content if PHASE1[FUNC] was entered on the exit of the SELFTTEST state |

## 8.2.4.8 PHASE2[FUNC]

### 8.2.4.8.1 PHASE2[FUNC] State Entry

This state can be entered from state

- PHASE1[FUNC].

### 8.2.4.8.2 PHASE2[FUNC] State Execution

FLASH executes an initialization sequence for slow array access.

### 8.2.4.8.3 PHASE2[FUNC] State Exit

Table 8-10. PHASE2[FUNC] Next State Table

| Next State   | Condition                                                                                                                                                                                                                                                                                                                  | Process/Module Started at Exit        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| PHASE0       | The MC_RGM has detected that the source of an enabled destructive reset event is asserted.                                                                                                                                                                                                                                 |                                       |
| PHASE1[DEST] | When self test is enabled: The MC_RGM has detected that the source of the enabled long functional reset event is asserted, and the source is an external reset.                                                                                                                                                            |                                       |
| PHASE1[FUNC] | The MC_RGM has detected that the source of the enabled long functional reset event is asserted, and the source is not an external reset.<br><br>or<br><br>When self test is disabled: The MC_RGM has detected that the source of the enabled long functional reset event is asserted, and the source is an external reset. |                                       |
| PHASE3[FUNC] | The FLASH module indicates the availability of slow array access.                                                                                                                                                                                                                                                          | SSCM<br>- starts device configuration |

## 8.2.4.9 PHASE3[FUNC]

### 8.2.4.9.1 PHASE3[FUNC] State Entry

This state can be entered from states

- PHASE2[FUNC]
- IDLE.

### 8.2.4.9.2 PHASE3[FUNC] State Execution

SSCM runs device configuration if the state was entered from PHASE2[FUNC].

The FCCU executes its configuration sequence if PHASE3[FUNC] was entered via the SELFTEST state.

The FLASH makes the transition from slow to full speed array access.

### 8.2.4.9.3 PHASE3[FUNC] State Exit

Table 8-11. PHASE3[FUNC] Next State Table

| Next State   | Condition                                                                                                                                                                                                                                                                                                                  | Process/Module Started at Exit |

## 8.2.4.10 IDLE

### 8.2.4.10.1 IDLE State Entry

The IDLE state can be entered only from states

- PHASE3[DEST]
- PHASE3[FUNC].

### 8.2.4.10.2 IDLE State Execution

During the IDLE state, the device is fully operational.

### 8.2.4.10.3 IDLE State Duration

There are no bounds on the duration of this state.

### 8.2.4.10.4 IDLE State Exit

The IDLE state next state table is given in the following table.

**Table 8-12. IDLE Next State Table**

| Next State   | Condition                                                                                                                                                                                                                                                                                                                  | Process/Module Started at Exit |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| PHASE0       | The MC_RGM has detected that the source of an enabled destructive reset event is asserted.                                                                                                                                                                                                                                 |                                |
| PHASE1[DEST] | When self test is enabled: The MC_RGM has detected that the source of the enabled long functional reset event is asserted, and the source is an external reset.                                                                                                                                                            |                                |
| PHASE1[FUNC] | The MC_RGM has detected that the source of the enabled long functional reset event is asserted, and the source is not an external reset.<br><br>or<br><br>When self test is disabled: The MC_RGM has detected that the source of the enabled long functional reset event is asserted, and the source is an external reset. |                                |
| PHASE3[FUNC] | The MC_RGM has detected that the source of an enabled short functional reset event is asserted.                                                                                                                                                                                                                            |                                |
| SELFTEST     | The application has triggered the start of the shutdown self-test.                                                                                                                                                                                                                                                         |                                |

## 8.2.5 Module Status During Reset Process

The following table specifies the status of the device modules during the reset process. The status abbreviations are explained in [Table 8-14](#).

**Table 8-13. Module status during reset states**

| Module              | POWERUP | Global Reset State |              |              |              |          |              |              |              |      |
|---------------------|---------|--------------------|--------------|--------------|--------------|----------|--------------|--------------|--------------|------|
|                     |         | PHASE0             | PHASE1[DEST] | PHASE2[DEST] | PHASE3[DEST] | SELFTEST | PHASE1[FUNC] | PHASE2[FUNC] | PHASE3[FUNC] | IDLE |

| FCCU                | RST     | RST                | RST          | ON           | ON           | BIST     | ON           | ON           | ON           | ON   |
| STCU                | RST     | RST                | RST          | ON           | ON           | ON       | ON           | ON           | ON           | ON   |
| CORE                | RST     | RST                | RST          | RST          | RST          | BIST     | RST          | RST          | RST          | ON   |
| OTHERS              | RST     | RST                | RST          | RST          | RST          | BIST     | RST          | RST          | RST          | ON   |

1. IRCOSC registers are reset with the PHASE3 reset, but the analog portion of the IRCOSC is reset only with the POWERUP. Therefore, as the table shows, the IRCOSC is running during all phases except POWERUP.
2. XOSC registers are reset with the PHASE3 reset, but the analog portion of the XOSC is reset during the PHASE3 reset sequence (pre-self-test) only if configured in the UTEST portion of the flash memory.

**Table 8-14. Module Status Glossary**

| Module Status | Status Description                                                                                            |
|---------------|---------------------------------------------------------------------------------------------------------------|
| RST           | Module is held in reset by the global reset process                                                           |
| BIST          | Module is being tested or held in a non-functional state during self-test execution as controlled by the STCU |
| ON            | Module is functional                                                                                          |

## Chapter 9

# Device Configuration Format (DCF) Records

### 9.1 Introduction

The system reset sequence is a complex process implementing a considerable amount of initialization before releasing reset.

Before the device can be used by an application, the application code, application specific reset values, and Device Configuration Format (DCF) records must be properly programmed into their respective flash memories. DCF records are used to configure certain registers – the DCF clients – in the device during the reset sequence. For this purpose, the System Status and Control Module (SSCM) reads the DCF records from flash and writes the configuration information to the specified DCF clients. Thus, many operational aspects of the device are properly configured before the reset signal is released and normal device operation begins.

### 9.2 DCF clients

DCF clients are simply designated registers in the device which receive their value from DCF records. (Some DCF clients may additionally be writable directly from the CPU, once the device has exited the reset sequence. In this case the DCF records placed in UTEST will initialize the client, i.e. defining it's reset value.)

Depending on their usage DCF clients may be equipped with a variety of safety features and modification rules.

#### 9.2.1 Safety features of DCF clients

Depending on its role in the device, a client may be equipped with a single safety feature or a combination of safety features.

### 9.2.1.1 Parity

If a DCF client implements parity checking, then it will receive a parity bit additionally to its data in the DCF record. During device operation it will continuously monitor whether the data it stores matches the parity and report errors to the SSCM.

### 9.2.1.2 Triple voting

DCF clients that use the triple voting have three copies of the register. The SSCM will write to all three registers in a single write cycle. During device operation the DCF client continuously monitors whether all three copies match and reports errors to the SSCM. The device will use the majority result, so single errors will not affect device operation.

### 9.2.1.3 Spread triple voting

DCF clients that use spread triple voting have three copies of the register which are individually addressed and where the data is stored in three different formats. The SSCM will fetch these records independently. During device operation the DCF client continuously monitors whether all three copies can be resolved from the stored format to the value and reports errors to the SSCM. The device will use the majority result, so single errors will not affect device operation.

### 9.2.1.4 Second write check

This feature is used by DCF clients which receive their records twice - e.g. once before and once after BIST for clients which retain their value during self test. They will monitor whether the second write matches the first and report deviations to the SSCM.

## 9.2.2 DCF client modification rules

Depending on its role in the device a client may implement one or a combination of modification rules. If a modification rule is in effect, the order in which DCF records are placed in the record list may be important.

### 9.2.2.1 Write Once

A DCF client using the Write Once rule can only be written with a single DCF record. Records appended later in the list will be ignored and not change the value of the client.

### 9.2.2.2 Write 0 only

A bit in a DCF client can only be written from a 1 to a 0. So, if an earlier DCF record has set a bit to 0, then an attempt by a later record to set this bit to a 1 will be ignored.

### 9.2.2.3 Write 1 only

A bit in a DCF client can only be written from a 0 to a 1. So, if an earlier DCF record has set a bit to 1, then an attempt by a later record to set this bit to a 0 will be ignored.

## 9.3 DCF records

An individual DCF record consists of information to locate the corresponding DCF client internal to the device (control word) and the data to be written to that client (data word).

DCF records appear as contiguous series of entries programmed at a specific address within flash memory. The following structure must be present:

- The first DCF record must be a start record. This record must be placed at the beginning of a DCF area in flash memory to indicate to the device that the following records must be processed.
- DCF records containing configuration data must immediately follow the start record with no blank records between—an unprogrammed record is interpreted as a stop record and no DCF records following that record are processed. This allows one to program the records in several sessions, each time appending new records at the end of the list.
- The end of the configuration records are indicated by the presence of a stop record; indicated by the stop bit being set. Normally, the stop bit is never set in a valid UTEST DCF record programmed during production, since this would prevent appending additional UTEST records. The flash memory location following the last UTEST DCF record programmed at the factory is an unprogrammed location. Therefore, that location's contents will be 0xFFFF\_FFFF. Thus, the stop bit location in this unprogrammed flash memory location will be a logic 1, signifying that this is the last DCF record and it is not to be acted upon.

For a detailed discussion of the basic DCF record format, its fields, and specific records (start, stop) refer to the corresponding chapter in the documentation of the System Status and Control Module (SSCM).

## 9.4 DCF clients available in the SOC

This section describes user-visible DCF clients in the device. These clients can be controlled by programming DCF records in UTEST. The default values given are those which are active if there are no records for these clients in UTEST.

**Table 9-1. Clients which can be set by the user.**

| DCF_Client     | Control Word                                  | Default Value                              | Modification Rule | Safety                  | Description                                                                                                           |            |

### 9.4.1 Security and serial boot mode records

For a description for the flash memory backdoor password, serial boot mode, and security records, see the SSCM details in [Security](#) and [Serial access security](#).

### 9.4.2 OTP records

The description of the OTP records is in the [Flash OTP Control](#) details.

### 9.4.3 FCCU record

The FCCU record allows you to define the initial value for the FCCU\_CFG register. The register holds this initial value after the device exits the reset sequence. See [Figure 9-1](#). For a description of the register, see the dedicated FCCU chapter.

As a client with high importance for the safety concept, the FCCU DCF client uses the spread triple voting feature. This feature means that three records must be written to set the values for the client.

The meaning of the data bits is not the same for all records. The first record uses the standard format, the second inverts the values of the first (see [Figure 9-2](#)), and the third shift-rotates the values to the left (see [Figure 9-3](#)).

#### 9.4.3.1 Field descriptions

- The CM field is always 0b.
- For descriptions of the other fields, see [Configuration \(FCCU\\_CFG\)](#).

#### 9.4.4 SOC configuration record

The SOC configuration record configures central functionality of the chip.

|              |     |     |
|--------------|-----|-----|
| 0:29         | 30  | 31  |

**Figure 9-4. SOC Configuration Record**

For descriptions of the WDE and CCE fields, see [SSCM\\_UOPS register and soc\\_conf DCF client](#).

### 9.4.5 STCU configuration records

The STCU provides a large number of configuration records. The [STCU chapter](#) provides details.

# Chapter 10

## Device Security

### 10.1 Device Security

Device security, which is implemented by the [SSCM](#), focuses on preventing unauthorized access to the flash memory contents.

The following features are available:

- 64-bit password protection
- Challenge timeout to protect against brute force attacks
- Swallowed key feature
- Voltage-attack protection
- Public serial boot mode to allow limited device diagnostics without giving access to the Flash
- Private serial boot mode for application code update
- JTAG unsecure feature to allow debugging of secured devices for authorized developers

# Chapter 11

## Debug

### 11.1 Introduction

The chapter discusses the device specific information for the debug modules. This device implements both, a Nexus trace auxiliary port with MDO/MSEO pins and a Nexus Aurora interface. The Aurora interface allows the Nexus protocol information to be transmitted serially at a high rate of speed over two Aurora lanes. The Aurora protocol handles the encoding of the data and striping the information across the Aurora lanes available on the device. The device starts up in JTAG mode.

The Event Out ( $\overline{\text{EVTO}}$ ) signal is connected to the external PAD[90] device pin and the Event In (EVTI\_IN) signal is connected to the external PAD[91] device pin.

#### NOTE

It should be expected that during a destructive reset event, the entire device is reset including debug modules and the debugger loses connectivity with the chip. Whenever the device is under debug and gets a long functional reset, it will lose connection with the debugger. During software development if a reset cycle is necessary without disconnecting the debugger, a short functional reset can be used.

### 11.2 e200z4 core debug support

Internal debug support in the e200z4 core allows for software and hardware debug by providing debug functions, such as instruction and data breakpoints and program trace modes.

For details, see [e200z4 Core Debug Support](#).

## 11.3 Core lockstep and RCCU disablement in debug mode

In debug mode, the RCCUs are disabled, and the cores do not operate in Lockstep mode.

The actual enabled/disabled state of the RCCUs (including any automatic disablement by debug) can be read by software in the RCCU Status (RCCU\_STAT) register.

**Table 11-1. RCCU Status register details**

| Address    | Register name | Width (in bits) | Access | Reset value |
|------------|---------------|-----------------|--------|-------------|
| FFC0_C004h | RCCU_STAT     | 32              | R      | 0000_0000h  |

The read-only RCCU Status register holds the RCCU Status Flag (RSF) that indicates RCCU enablement/disablement.

|       |          |    |    |    |    |    |   |   |   |   |   |   |   |   |   |     |
|-------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|-----|

| 1-31<br>Reserved | This read-only field is reserved and always has the value 0.                                                                         |

## 11.4 Run control and memory access

Run control is any operation required to control the device operation. Run control includes starting and stopping execution of code by the processor, as well as access to memory while the device is stopped to download code.

The JTAG interface supports both boundary scan and debug modes. It is based on the IEEE1149.1-2001 standard. The JTAG Controller (JTAGC) operates in the standard IEEE 1149.1 5-wire interface.

## 11.5 JTAG Controller (JTAGC)

The JTAGC block provides the means to test chip functionality and connectivity while remaining transparent to system logic when not in test mode. Testing is performed via a boundary scan technique, as defined in the IEEE1149.1-2001 standard. All data input to and output from the JTAGC block is communicated in serial format. All Nexus debug registers are accessed and configured via the JTAG controller.

For details, see the JTAG Controller (JTAGC) chapter.

### 11.5.1 JTAGC ACCESS\_AUX block instructions

The ACCESS\_AUX instructions are described in this table.

**Table 11-3. ACCESS\_AUX 5-bit JTAG instructions**

| Instruction       | Code[4:0]   | Instruction Summary                                                                           |
|-------------------|-------------|-----------------------------------------------------------------------------------------------|
| ACCESS_AUX_x      | 10000–11110 | Grants one of the auxiliary TAP controllers ownership of the TAP as shown in the cells below. |
| ACCESS_AUX_NPC    | 10000       | Enables access to the NPC TAP controller                                                      |
| Reserved          | 10001       | Reserved                                                                                      |
| Reserved          | 10010       | Reserved                                                                                      |
| Reserved          | 10011       | Reserved                                                                                      |
| Reserved          | 10100       | Reserved                                                                                      |
| Reserved          | 10101       | Reserved                                                                                      |
| Reserved          | 10110       | Reserved                                                                                      |
| ACCESS_AUX_NXMC_0 | 10111       | Enables access to the Nexus XBAR Multimaster Client 0 TAP controller                          |
| ACCESS_AUX_NXMC_1 | 11000       | Enables access to the Nexus XBAR Multimaster Client 1 TAP controller                          |
| Reserved          | 11001       | Reserved                                                                                      |
| ACCESS_AUX_LSM    | 11010       | Enables access to multiple cores in parallel when in lock step mode (LSM)                     |
| Reserved          | 11011       | Reserved                                                                                      |
| Reserved          | 11100       | Reserved                                                                                      |
| Reserved          | 11101       | Reserved                                                                                      |
| ACCESS_AUX_NAL    | 11110       | Enables access to NAL                                                                         |

## 11.5.2 TEST\_CTRL register

The following register details elaborate on the general description in [TEST\\_CTRL Register](#) of the dedicated JTAGC chapter.

| TEST_CTRL |         |    |              |    |         |    |         |   |                 |   |                   |                   |                   |                 |   |      |                   |                   |                   |                   |                   |                   |
|-----------|---------|----|--------------|----|---------|----|---------|---|-----------------|---|-------------------|-------------------|-------------------|-----------------|---|------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|

|                 | 1      BSR pad control enabled                                                                                                                                                                                                                                                                                                                   |
| NEX_RDY_PORT_EN | RDY_B Enable<br>Enables RDY_B functionality for corresponding GPIO pin. Setting this bit overrides the SIUL2 output muxing configuration for the corresponding pad.<br>0      Disables RDY_B functionality (output mux for the pad is controlled by SIUL2)<br>1      Enables RDY_B functionality (output mux for the pad is controlled by JTAGC) |

### 11.5.3 Device identification register reset values

The reset value of the Device identification register (JTAG ID) Register depends on the chip version:

- Maskset N15P : 29B4501Dh
- Maskset 1N65H : 19B4501Dh
- Maskset 0N65H : 09B4501Dh

## 11.6 Nexus Port Controller (NPC)

### 11.6.1 Chip-specific NPC information

This section presents device-specific parameterization, customization, and feature availability information not specifically referenced in the remainder of this chapter.

#### 11.6.1.1 Parameter values

The parameter values for this device are shown in the following table.

**Table 11-6. Device parameter values**

| Parameter                                        | Value |
|--------------------------------------------------|-------|
| Number of MDO pins available (Reduced port mode) | 4     |
| Part identification number (PIN)                 | 345h  |
| Manufacturer identity code (MIC)                 | 00Eh  |
| Design center code (DC)                          | 26h   |

### 11.6.1.2 DID register reset and parameter values

The reset value of the [Nexus Device ID \(DID\) Register](#) depends on the chip version:

- Maskset 1N65H: 19B4501Dh
- Maskset 0N65H: 09B4501Dh
- Maskset N15P: 29B4501Dh

The PRN, PIN, and DC parameters define the chip-specific values of correspondingly named fields in the DID register. The following table provides the values of those DID fields and of the register's MIC field.

**Table 11-7. Values of PRN, DC, PIN, and MIC fields of DID register**

| DID field | Device-specific value |
|-----------|-----------------------|
| PRN       | 1h <sup>1</sup>       |
| DC        | 26h                   |
| PIN       | 345h                  |
| MIC       | 00Eh                  |

1. For maskset 0N65H, PRN is 0h.

### 11.6.1.3 ACR field values

The LVDS\_RXOPT and LVDS\_TXOPT fields of the Aurora Configuration Register (ACR) function as controls for LVDS pads. For these fields, the following table identifies the bits actually used on the device and the meaning of their settings.

#### NOTE

Bits that are not listed are reserved.

**Table 11-8. Settings for LVDS\_RXOPT and LVDS\_TXOPT fields of ACR**

| Field bit       | Device-specific setting descriptions                                                   |
|-----------------|----------------------------------------------------------------------------------------|
| LVDS_RXOPT1     | Default value is 0. When set to 1, increases RX current by 20%.                        |
| LVDS_RXOPT0     | Default value is 0. When set to 1, decreases RX current by 20%.                        |
| LVDS_TXOPT7     | Default value is 0. When set to 1, decreases internal bias current by 50%.             |
| LVDS_TXOPT6     | Default value is 0. When set to 1, increases internal bias current by 50%.             |
| LVDS_TXOPT[4:3] | For each bit:<br>Default value is 0. When set to 1, decreases output current by 12.5%. |
| LVDS_TXOPT[2:1] | For each bit:<br>Default value is 0. When set to 1, increases output current by 12.5%. |

### 11.6.1.4 Unavailable features

- MCKO division factor of 3 is not supported on this device. Therefore, the setting  $\text{PCR}[\text{MCKO\_DIV}] = 2$  is not available
- Nexus DDR mode is not available on this device
- PSTAT mode is not available on this device

The following bits in the Port Configuration Register should always be written as zeros. These features are not available in the device:

- DDR\_EN
- NEXCFG
- PSTAT\_EN
- LP2\_SYN

### 11.6.2 Block diagram

The following figure is a block diagram of the Nexus Port Controller (NPC) block.

Figure 11-1. Nexus Port Controller Block Diagram

### 11.6.2.1 Overview

On a system-on-a-chip device, there are often multiple blocks that require development support. Each of these blocks implements a development interface based on the IEEE-ISTO 5001. The blocks share input and output ports that interface with the development tool. The NPC controls the usage of the input and output port in a manner that allows all the individual development interface blocks to share the port, and appear to the development tool to be a single block.

### 11.6.2.2 Features

The NPC block performs the following functions:

- Controls arbitration for ownership of the Nexus Auxiliary Output Port
- Nexus Device Identification Register and Messaging
- Generates MCKO enable and frequency division control signals
- Controls sharing of EVTO
- Generates an MCKO clock gating control signal to enable gating of MCKO when the auxiliary output port is idle
- Control of the device-wide debug mode
- Generates asynchronous reset signal for Nexus blocks based on JCOMP input, censorship status, and power-on reset status
- System clock locked status indication via MDO[0] following power-on reset
- Provides Nexus support for censorship mode
- Controls arbitration for ownership of the Nexus Aurora Link (NAL) in Aurora Link mode
- $\overline{\text{RDY}}$  pin support to increase the transfer rate of the IEEE 1149.1 port for large data read requests
- Low-power debug handshaking: see [NPC Handshake](#)

#### NOTE

MCKO may be gated one clock period early when MCKO's frequency is programmed as divide by 8 (MCKO\_DIV= b111) and the MCKO gating function is enabled (MCKO\_GT=1). In this case, the last MCKO received by the tool prior to the gating will correspond to the END\_MESSAGE state. The tool will not receive an MCKO to indicate the transition to the IDLE state even though the NPC will transition to the IDLE state internally. Upon re-enabling of MCKO the first MCKO edge will drive the Message Start/End Output (MSEO=11) and move the tool's state to IDLE. Expect to receive the MCKO edge

corresponding to the IDLE state upon re-enabling of MCKO after MCKO has been gated.

### 11.6.2.3 Modes of operation

The NPC block uses the JCOMP input, the censorship status, and an internal power-on reset indication as its primary reset signals. Upon exit of reset, the mode of operation is determined by the Port Configuration Register (PCR) settings. All available modes can be seen in [Table 11-12](#).

#### 11.6.2.3.1 Reset

The NPC block is asynchronously placed in reset when either power-on reset is asserted, JCOMP is not set for Nexus access, the device enters censored mode, or the JTAG Test Access Port (TAP) controller state machine is in the Test-Logic-Reset state. Holding TMS high for 5 consecutive rising edges of TCK guarantees entry into the Test-Logic-Reset state regardless of the current TAP controller state. Following negation of power-on reset, the NPC remains in reset until the system clock achieves lock. The NPC is unaffected by other sources of reset. While in reset, the following actions occur:

- The TAP controller is forced into the Test-Logic-Reset state
- The auxiliary output port pins are negated
- The TDI, TMS, and TCK TAP inputs are ignored (when in power-on reset, censored mode or JCOMP not set for NPC operation only)
- Registers default back to their reset values

#### 11.6.2.3.2 Disabled-Port mode

In disabled-port mode, auxiliary output pin port enable signals are negated, thereby disabling message transmission. Any debug feature that generates messages can not be used. The primary features available are class 1 features and read/write access to the registers. Class 1 features include the ability to trigger a breakpoint event indication through  $\overline{\text{EVTO}}$ .

#### 11.6.2.3.3 Aurora Link mode (High Speed Debug mode)

In Aurora Link mode, trace data is transmitted through the Nexus Aurora Link (NAL) instead of the auxiliary port. For SoCs that support a Nexus Aurora Link, the FPM bit in the PCR functions as the Aurora Link enable, leaving reduced port mode (RPM) as the only available mode for data transmission via the auxiliary port. Aurora Link Mode is

enabled by setting the MCKO\_EN and FPM bits and selecting a non-zero value for the ALC\_NUM\_LN bits in the PCR. The MCKO\_DIV value should be set to select a clock frequency equal to the system clock frequency (MCKO\_DIV = 000).

#### 11.6.2.3.4 Reduced-Port mode (Auxiliary Interface Debug mode)

Reduced-port mode (RPM) is entered by asserting the MCKO\_EN bit and deasserting the FPM bit in the PCR. All trace features are enabled or can be enabled by writing the configuration registers via the TAP. The number of MDO pins available is device-specific. Nexus Aurora Link is not available.

#### 11.6.2.3.5 Censored mode

When the device is in censored mode, reading the contents of internal flash externally is not allowed. To prevent Nexus modules from violating censorship, the NPC is held in reset when in censored mode, asynchronously holding all other Nexus modules in reset as well. This prevents Nexus read/write to memory mapped resources and the transmission of Nexus trace messages.

### 11.6.3 External signal description

#### 11.6.3.1 Overview

The NPC pin interface provides for the transmission of messages from Nexus blocks to the external development tools and for access to Nexus client registers. The following table outlines NPC pin definitions.

**Table 11-9. NPC Signal Properties**

| Name      | Port      | Function                                | Reset State | Pull |
|-----------|-----------|-----------------------------------------|-------------|------|
| EVTO      | Auxiliary | Event Out pin                           | 0b1         | -    |
| EVTI_IN   | Auxiliary | Event In pin                            | -           | -    |
| JCOMP     | JTAG      | JTAG Compliancy and TAP Sharing Control | -           | Down |
| MDO[3:0]  | Auxiliary | Message Data Out pins                   | 0           | -    |
| MSEO[1:0] | Auxiliary | Message Start/End Out pins              | 0b11        | -    |
| TCK       | JTAG      | Test Clock Input                        | -           | Up   |
| TDI       | JTAG      | Test Data Input                         | -           | Up   |

*Table continues on the next page...*

**Table 11-9. NPC Signal Properties (continued)**

| Name                    | Port | Function                                                                                                         | Reset State | Pull |
|-------------------------|------|------------------------------------------------------------------------------------------------------------------|-------------|------|
| TDO                     | JTAG | Test Data Output                                                                                                 | High Z      | -    |
| TMS                     | JTAG | Test Mode Select Input                                                                                           | -           | Up   |
| $\overline{\text{RDY}}$ | JTAG | Data ready for transfer to/from Nexus<br>Recommended Registers (NRRs; see also the IEEE-ISTO 5001-2003 standard) | -           | -    |

### 11.6.3.2 Detailed signal descriptions

This section describes each of the signals listed in [Table 11-9](#) in more detail. The JTAG test clock (TCK) input from the pin is not a direct input to the NPC. The NPC requires two separate input clocks for TCK clocked logic, one for posedge (rising edge TCK) logic and one for negedge (falling edge TCK) logic. Both clocks are derived from the pin TCK, and generated external to the NPC.

#### 11.6.3.2.1 $\overline{\text{EVTO}}$ - Event Out

Event Out ( $\overline{\text{EVTO}}$ ) is an output pin that is asserted upon breakpoint occurrence to provide breakpoint status indication. The  $\overline{\text{EVTO}}$  output of the NPC is generated based on the values of the individual  $\overline{\text{EVTO}}$  signals from all Nexus blocks that implement the signal.

#### 11.6.3.2.2 JCOMP - JTAG Compliancy

The JCOMP signal provides the ability to share the TAP. The NPC TAP controller is enabled when JCOMP is set to the NPC enable encoding; otherwise the NPC TAP controller remains in reset.

#### 11.6.3.2.3 MDO - Message Data Out

Message Data Out (MDO) are output pins used for uploading Ownership Trace Messaging (OTM), Branch Trace Messaging (BTM), Data Trace Messaging (DTM) and other messages to the development tool. The development tool should sample MDO on the rising edge of MCKO. The width of the MDO bus used is determined by reset configuration.

#### 11.6.3.2.4 MSEO\_B - Message Start/End Out

Message Start/End Out ( $\overline{\text{MSEO}}$ ) is an output pin that indicates when a message on the MDO pins has started, when a variable length packet has ended, or when the message has ended. The development tool should sample  $\overline{\text{MSEO}}$  on the rising edge of MCKO.

#### 11.6.3.2.5 TCK - Test Clock Input

Test Clock Input (TCK) pin is used to synchronize the test logic and control register access through the JTAG port.

The JTAG Clock (TCK) typically operates at a frequency well below the system clock frequency, as specified in the electrical data sheets. In some cases, however, such as low power mode, the system clock frequency may be lowered significantly from the normal operating range. If the system clock frequency is reduced below the frequency of TCK it will no longer be possible to communicate with the Nexus Port Controller Port Configuration Register (PCR). Therefore, if the tool needs to update the PCR Low Power Debug Enable (PCR[LP\_DBG]) or Low Power Synchronization bits (PCR[LP1\_SYN] and PCR[LP2\_SYN]), the clock frequency must be lowered.

Ensure that the frequency of TCK does not exceed the system clock frequency during normal operation and during low power operation. For usage of the NPC/Nexus/NXSS subsystem, TCK clock frequency needs to be smaller than SYSCLK/2.

#### 11.6.3.2.6 TDI - Test Data Input

Test Data Input (TDI) pin receives serial test instruction and data. TDI is sampled on the rising edge of TCK.

#### 11.6.3.2.7 TDO - Nexus Test Data Output

Test Data Output (TDO) pin transmits serial output for instructions and data. TDO is three-stateable and is actively driven in the SHIFT-IR and SHIFT-DR controller states. TDO is updated on the falling edge of TCK and sampled by the development tool on the rising edge of TCK.

#### 11.6.3.2.8 TMS - Test Mode Select

Test Mode Select Input (TMS) pin is used to sequence the IEEE1149.1-2001 TAP controller state machine. TMS is sampled on the rising edge of TCK.

### 11.6.3.2.9 $\overline{\text{RDY}}$ - Data ready for transfer

The  $\overline{\text{RDY}}$  pin exists to increase the transfer rate of the IEEE 1149.1 port. It is used to signal when data are ready to be transferred to and from the NRRs (see also IEEE-ISTO 5001-2003). This may eliminate the need to poll NRRs for status information for synchronization purposes. This capability becomes especially important when performing read/write access transfers to different speed target memories.

The  $\overline{\text{RDY}}$  pin asserts (asynchronously) a logic low whenever the read/write access transfer has completed without error and then deasserts when the IEEE 1149.1 state machine has reached the CAPTURE\_DR state.

The  $\overline{\text{RDY}}$  pin is controlled by the TEST\_CTRL register in the JTAGC module. See the JTAG Controller (JTAGC) chapter.

## 11.6.4 Register definition

This section provides a detailed description of the NPC registers accessible to the end user. Individual bit-level descriptions and reset states of the registers are included.

The following table shows the NPC registers by index values. The registers are not memory-mapped and can only be accessed via the TAP. The NPC block does not implement the client select control register because the value does not matter when accessing the registers. Note that the bypass and instruction registers have no index values. These registers are not accessed in the same manner as Nexus client registers. Refer to the individual register descriptions in Nexus Port Controller (NPC) chapter for more details.

**Table 11-10. NPC Registers**

| Index | Register                            |
|-------|-------------------------------------|
| 0     | Device ID Register (DID)            |
| 126   | Aurora Configuration Register (ACR) |
| 127   | Port Configuration Register (PCR)   |

### 11.6.4.1 Register descriptions

11.6.4.1.1 Bypass register

The bypass register is a single-bit shift register path selected for serial data transfer between TDI and TDO when the BYPASS instruction or any unimplemented instructions are active. After entry into the Capture-DR state, the single-bit shift register is set to a logic 0. Therefore, the first bit shifted out after selecting the bypass register is always a logic 0.

11.6.4.1.2 Instruction Register

The NPC block uses a 4-bit instruction register as shown in the following table. The instruction register is accessed via the SELECT\_IR\_SCAN path of the TAP controller state machine, and allows instructions to be loaded into the block to enable the NPC for register access (NEXUS\_ENABLE; see also Table 11-21) or select the bypass register as the shift path from TDI to TDO (BYPASS or unimplemented instructions).

NOTE

For details, see Figure 11-5.

Instructions are shifted in through TDI while the TAP controller is in the Shift-IR state, and latched on the falling edge of TCK in the Update-IR state. The latched instruction value can only be changed in the Update-IR and Test-Logic-Reset TAP controller states. Synchronous entry into the Test-Logic-Reset state results in synchronous loading of the BYPASS instruction. Asynchronous entry into the Test-Logic-Reset state results in asynchronous loading of the BYPASS instruction. During the Capture-IR TAP controller state, the instruction register is loaded with the value of the previously executed instruction, making this value the register's read value when the TAP controller is sequenced into the Shift-IR state.

|        |                                 |   |   |   |
|--------|---------------------------------|---|---|---|
|        | 0                               | 1 | 2 | 3 |
| R      | Previous Instruction Opcode     |   |   |   |
| W      | Instruction Opcode              |   |   |   |
| Reset: | BYPASS Instruction Opcode (0xF) |   |   |   |

11.6.4.1.3 Nexus Device ID Register (DID)

The device identification register allows the part revision number, design center, part identification number, and manufacturer identity code of the part to be determined through the auxiliary output port.

#### 11.6.4.1.4 Aurora Configuration Register (ACR)

The ACR is used to configure the RXOPT and TXOPT settings of the LVDS receive and transmit pads.

#### 11.6.4.1.5 Port Configuration Register (PCR)

The PCR is used to select the NPC mode of operation, enable MCKO and select the MCKO frequency, and enable or disable MCKO gating. This register should be configured as soon as the NPC is enabled.

The PCR register may be rewritten by the debug tool subsequent to the enabling of the NPC for low power debug support. In this case, the debug tool may set and clear the LP\_DBG and LPn\_SYN bits, but must preserve the original state of the remaining bits in the register. For details, see [NPC Handshake](#).

#### NOTE

The mode or clock division must not be modified after MCKO has been enabled. Changing the mode or clock division while MCKO is enabled can produce unpredictable results.

### 11.6.5 Functional Description

#### 11.6.5.1 NPC reset configuration

The NPC is placed in disabled mode upon exit of reset. If message transmission via the auxiliary port is desired, a write to the PCR is then required to enable the NPC and select the mode of operation. Asserting MCKO\_EN places the NPC in enabled mode and enables MCKO. The frequency of MCKO is selected by writing the MCKO\_DIV field. Asserting or negating the FPM bit selects full-port or reduced-port mode, respectively.

For Nexus Aurora Link, asserting the MCKO\_EN and FPM bits and setting the NUM\_ALC\_LN bits to a non-zero value enables NAL data transmission. Transmission of data via the auxiliary port is enabled only by selecting the RPM configuration in this case.

The following table describes the NPC reset configuration options.

**Table 11-12. NPC Reset Configuration Options**

| JCOMP Equal to 1? | MCKO_EN bit of the Port Configuration Register | NUM_ALC_LN bits of the Port Configuration Register > 0? | FPM bit of the Port Configuration Register | Configuration     |
|-------------------|------------------------------------------------|---------------------------------------------------------|--------------------------------------------|-------------------|
| no                | X                                              | X                                                       | X                                          | Reset             |
| yes               | 0                                              | X                                                       | X                                          | Disabled          |
| yes               | 1                                              | yes                                                     | 1                                          | Aurora Link Mode  |
| yes               | 1                                              | X                                                       | 0                                          | Reduced-Port Mode |

**NOTE**

If the device is censored, the NPC is held in reset, asynchronously holding all other Nexus modules in reset as well

**11.6.5.2 Auxiliary output port**

The auxiliary output port is shared by each of the Nexus modules on the device. The NPC communicates with each of the Nexus modules and arbitrates for access to the port.

**11.6.5.2.1 Output Message Protocol**

The protocol for transmitting messages via the auxiliary port is accomplished with the  $\overline{\text{MSEO}}$  functions. The  $\overline{\text{MSEO}}$  pins are used to signal the end of variable-length packets and the end of messages. They are not required to indicate the end of fixed-length packets. MDO and  $\overline{\text{MSEO}}$  are sampled on the rising edge of MCKO.

The following figure illustrates the state diagram for  $\overline{\text{MSEO}}$  transfers. All transitions not included in the figure are reserved, and must not be used.

Figure 11-2.  $\overline{\text{MSEO}}$  bit transfers (for 2-bit  $\overline{\text{MSEO}}$ )

### 11.6.5.2.2 Output Messages

In addition to sending out messages generated in other Nexus blocks, the NPC can also output the device ID message contained in the device ID register and the port replacement output message on the MDO pins. The device ID message can also be sent out serially through TDO.

The following table describes the device ID and port replacement output messages that the NPC can transmit on the auxiliary port. The TCODE is the first packet transmitted.

Table 11-13. NPC Output Messages

| Message Name      | Min. Packet Size (bits) | Max Packet Size (bits) | Packet Type | Packet Name | Packet Description |
|-------------------|-------------------------|------------------------|-------------|-------------|--------------------|
| Device ID Message | 6                       | 6                      | fixed       | TCODE       | Value = 1          |

Table continues on the next page...

**Table 11-13. NPC Output Messages (continued)**

| Message Name                      | Min. Packet Size (bits) | Max Packet Size (bits) | Packet Type | Packet Name | Packet Description                                        |
|-----------------------------------|-------------------------|------------------------|-------------|-------------|-----------------------------------------------------------|
|                                   | 32                      | 32                     | fixed       | ID          | DID register contents                                     |
| Aurora Link Overrun Error Message | 6                       | 6                      | fixed       | TCODE       | Value = 8                                                 |
|                                   | 4                       | 4                      | fixed       | SRC         | Nexus Aurora Link SRC value (SRC=0xF).                    |
|                                   | 5                       | 5                      | fixed       | ECODE       | Value = 01000. Error code indicating overrun of NAL FIFO. |

The following table shows the various message formats that the pin interface formatter must encounter. Note that for variable-length fields, the transmitted size of the field is determined from the range of the least significant bit to the most significant non-zero-valued bit (i.e. most significant zero-valued bits are not transmitted).

**Table 11-14. Message Field Sizes**

| Message                           | TCODE | Field #1   | Field #2 | Field #3 | Field #4 | Field #5 | Min. Size <sup>1</sup> (bits) | Max Size <sup>2</sup> (bits) |
|-----------------------------------|-------|------------|----------|----------|----------|----------|-------------------------------|------------------------------|
| Device ID Message                 | 1     | Fixed = 32 | NA       | NA       | NA       | NA       | 38                            | 38                           |
| Aurora Link Overrun Error Message | 8     | Fixed=4    | Fixed=5  | N/A      | N/A      | N/A      | 15                            | 15                           |

1. Minimum information size. The actual number of bits transmitted depends on the number of MDO pins.

2. Maximum information size. The actual number of bits transmitted depends on the number of MDO pins.

The double edges in the preceding table indicate the starts and ends of messages. Fields without shaded areas between them are grouped into super-fields and can be transmitted together without end-of-packet indications between them.

#### 11.6.5.2.3 Rules of Message

- A variable-sized field within a message must end on a port boundary. (Port boundaries depend on the number of MDO pins active with the current reset configuration.)
- A variable-sized field may start within a port boundary only when following a fixed-length field.
- Super-fields must end on a port boundary.

- When a variable-length field is sized such that it does not end on a port boundary, it is necessary to extend and zero fill the remaining bits after the highest order bit so that it can end on a port boundary.
- Multiple fixed-length packets may start and/or end on a single clock.
- When any packet follows a variable-length packet, it must start on a port boundary.
- The field containing the TCODE number is always transferred out first, followed by subsequent fields of information.
- Within a field, the lowest significant bits are shifted out first. Figure 17 shows the transmission sequence of a message that is made up of a TCODE followed by two fields.

**Figure 11-3. Transmission sequence of messages**

### 11.6.5.3 IEEE 1149.1-2001 (JTAG) TAP

The NPC block uses the IEEE 1149.1-2001 TAP for accessing registers. Each of the individual Nexus blocks on the device implements a TAP controller for accessing its registers as well. TAP signals include TCK, TDI, TMS, and TDO. There may also be other blocks on the MCU that use the TAP and implement a TAP controller. The value of the JCOMP input controls ownership of the port between Nexus and non-Nexus blocks sharing the TAP.

Refer to the IEEE 1149.1-2001 specification for further detail on electrical and pin protocol compliance requirements.

The NPC implements a Nexus controller state machine that transitions based on the state of the IEEE 1149.1-2001 state machine shown in [Figure 11-5](#). The Nexus controller state machine is defined by the IEEE-ISTO 5001-2003 standard. It is shown in [Figure 11-6](#).

The instructions implemented by the NPC TAP controller are listed in the following table. The value of the NEXUS-ENABLE instruction is 0b0000. Each unimplemented instruction acts like the BYPASS instruction. The size of the NPC instruction register is 4-bits.

Table 11-15. Implemented Instructions

| Instruction Name | Private/Public | Opcode | Description                                                                       |
|------------------|----------------|--------|-----------------------------------------------------------------------------------|
| NEXUS-ENABLE     | public         | 0x0    | Activate Nexus controller state machine to read and write NPC registers.          |
| BYPASS           | private        | 0xF    | NPC BYPASS instruction. Also the value loaded into the NPC IR upon exit of reset. |

Data is shifted between TDI and TDO starting with the least significant bit as illustrated in the following figure. This applies for the instruction register and all Nexus tool-mapped registers.

Figure 11-4. Shifting data into register

11.6.5.3.1 Enabling the NPC TAP controller

Assertion of the power-on reset signal, entry into censored mode, or setting JCOMP to a value other than the NPC enable encoding resets the NPC TAP controller. When not in power-on reset or censored mode, the NPC TAP controller is enabled by driving JCOMP with the NPC enable value and exiting the Test-Logic-Reset state. Loading the NEXUS-ENABLE instruction then grants access to Nexus debug.

NOTE: The value shown adjacent to each state transition in this figure represents the value of TMS at the time of a rising edge of TCK.

**Figure 11-5. IEEE 1149.1-2001 TAP Controller state machine**

### 11.6.5.3.2 Retrieving device IDCODE

The Nexus TAP controller does not implement the IDCODE instruction. However, the device identification message can be output by the NPC through the auxiliary output port or shifted out serially by accessing the Nexus Device ID register through the TAP.

Transmission of the device identification message on the auxiliary output port MDO pins occurs immediately after a write to the PCR, if the NPC is enabled. Transmission of the device identification message serially via TDO is achieved by performing a read of the register contents as described in "Selecting a Nexus Client Register" section .

### 11.6.5.3.3 Loading NEXUS-ENABLE Instruction

Access to the NPC registers is enabled when the TAP controller instruction register is loaded with the NEXUS-ENABLE instruction. This instruction is shifted in via the SELECT-IR-SCAN path and loaded in the UPDATE-IR state. At this point, the Nexus controller state machine, shown in Figure 20 transitions to the REG\_SELECT state. The Nexus controller has three states: idle, register select, and data access. Following table illustrates the IEEE 1149.1 sequence to load the NEXUS-ENABLE instruction.

Figure 11-6. NEXUS controller state machine

Table 11-16. Loading NEXUS-ENABLE instruction

| Clock | TMS | IEEE 1149.1 State | Nexus State | Description                                      |
|-------|-----|-------------------|-------------|--------------------------------------------------|
| 0     | 0   | RUN-TEST/IDLE     | IDLE        | IEEE 1149.1-2001 TAP controller in idle state    |
| 1     | 1   | SELECT-DR-SCAN    | IDLE        | Transitional state                               |
| 2     | 1   | SELECT-IR-SCAN    | IDLE        | Transitional state                               |
| 3     | 0   | CAPTURE-IR        | IDLE        | Internal shifter loaded with current instruction |

Table continues on the next page...

**Table 11-16. Loading NEXUS-ENABLE instruction (continued)**

| Clock  | TMS | IEEE 1149.1 State | Nexus State | Description                                                                                                                   |
|--------|-----|-------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------|
| 4      | 0   | SHIFT-IR          | IDLE        | TDO becomes active, and the IEEE 1149.1-2001 shifter is ready. Shift in all but the last bit of the NEXUS_ENABLE instruction. |
| 3 TCKS |     |                   |             |                                                                                                                               |
| 12     | 1   | EXIT1-IR          | IDLE        | Last bit of instruction shifted in                                                                                            |
| 13     | 1   | UPDATE-IR         | IDLE        | NEXUS-ENABLE loaded into instruction register                                                                                 |
| 14     | 0   | RUN-TEST/IDLE     | REG_SELECT  | Ready to be read/write Nexus registers                                                                                        |

#### 11.6.5.3.4 Selecting a Nexus Client register

When the NEXUS-ENABLE instruction is decoded by the TAP controller, the input port allows development tool access to all Nexus registers. Each register has a 7-bit address index.

All register access is performed via the SELECT-DR-SCAN path. The Nexus Controller defaults to the REG\_SELECT state when enabled. Accessing a register requires two passes through the SELECT-DR-SCAN path: one pass to select the register and the second pass to read/write the register.

The first pass through the SELECT-DR-SCAN path is used to enter an 8-bit Nexus command consisting of a read/write control bit in the LSB followed by a 7-bit register address index, as illustrated in Figure 21. The read/write control bit is set to 1 for writes and 0 for reads.

**Table 11-17. IEEE 1149.1 Controller Command Input**

| MSB                  | LSB |
|----------------------|-----|
| 7-bit register index | R/W |

The second pass through the SELECT-DR-SCAN path is used to read or write the register data by shifting in the data (LSB first) during the SHIFT-DR state. When reading a register, the register value is loaded into the IEEE 1149.1-2001 shifter during the CAPTURE-DR state. When writing a register, the value is loaded from the IEEE

1149.1-2001 shifter to the register during the UPDATE-DR state. When reading a register, there is no requirement to shift out the entire register contents. Shifting may be terminated once the required number of bits have been acquired.

Following table illustrates a sequence which writes a 32-bit value to a register

**Table 11-18. Write to a 32-Bit Nexus Client register**

| Clock   | TMS | IEEE 1149.1 State | Nexus State | Description                                                                                          |
|---------|-----|-------------------|-------------|------------------------------------------------------------------------------------------------------|
| 0       | 0   | RUN-TEST/IDLE     | REG_SELECT  | IEEE 1149.1-2001 TAP controller in idle state                                                        |
| 1       | 1   | SELECT-DR-SCAN    | REG_SELECT  | First pass through SELECT-DR-SCAN path                                                               |
| 2       | 0   | CAPTURE-DR        | REG_SELECT  | Internal shifter loaded with current value of controller command input.                              |
| 3       | 0   | SHIFT-DR          | REG_SELECT  | TDO becomes active, and write bit and 6 bits of register index shifted in.                           |
| 7 TCKs  |     |                   |             |                                                                                                      |
| 12      | 1   | EXIT1-DR          | REG_SELECT  | Last bit of register index shifted into TDI                                                          |
| 13      | 1   | UPDATE-DR         | REG_SELECT  | Controller decodes and selects register                                                              |
| 14      | 1   | SELECT-DR-SCAN    | DATA_ACCESS | Second pass through SELECT-DR-SCAN path                                                              |
| 15      | 0   | CAPTURE-DR        | DATA_ACCESS | Internal shifter loaded with current value of register                                               |
| 16      | 0   | SHIFT-DR          | DATA_ACCESS | TDO becomes active, and outputs current value of register while new value is shifted in through TDI  |
| 31 TCKs |     |                   |             |                                                                                                      |
| 48      | 1   | EXIT1-DR          | DATA_ACCESS | Last bit of current value shifted out TDO. Last bit of new value shifted in TDI.                     |
| 49      | 1   | UPDATE-DR         | DATA_ACCESS | Value written to register                                                                            |
| 50      | 0   | RUN-TEST/IDLE     | REG_SELECT  | Controller returned to idle state. It could also return to SELECT-DR-SCAN to write another register. |

### 11.6.5.4 Nexus JTAG port sharing

Each of the individual Nexus blocks on the device implements a TAP controller for accessing its registers. When Nexus has ownership of the TAP, only the block whose NEXUS-ENABLE instruction is loaded has control of the TAP. This allows the interface to all of these individual TAP controllers to appear to be a single port from outside the device. If no register is selected as the shift path for a Nexus block, that block acts like a single-bit shift register, or bypass register.

### 11.6.5.5 MCKO

MCKO is an output clock to the development tools used for the timing of MSEO and MDO pin functions. MCKO is derived from the system clock and its frequency is determined by the value of the MCKO\_DIV field in the PCR. Possible operating frequencies include system clock, one-half system clock, one-quarter system clock, and one-eighth system clock speed.

The NPC also generates an MCKO clock gating control output signal. This output can be used by the MCKO generation logic to gate the transmission of MCKO when the auxiliary port is enabled but not transmitting messages. The setting of the MCKO\_GT bit inside the PCR determines whether or not MCKO gating control is active. The MCKO\_GT bit resets to a logic 0. In this state gating of MCKO is disabled. To enable gating of MCKO, the MCKO\_GT bit in the PCR is written to a logic 1.

### 11.6.5.6 $\overline{\text{EVTO}}$ Sharing

The NPC block controls sharing of the  $\overline{\text{EVTO}}$  output between all Nexus clients that produce an  $\overline{\text{EVTO}}$  signal. The NPC assumes incoming  $\overline{\text{EVTO}}$  signals will be asserted for one system clock period. After receiving a single clock period of asserted  $\overline{\text{EVTO}}$  from any Nexus client, the NPC latches the result, and drives  $\overline{\text{EVTO}}$  for one MCKO period on the following clock. When there is no active MCKO, such as in disabled mode, the NPC drives  $\overline{\text{EVTO}}$  for two system clock periods.  $\overline{\text{EVTO}}$  sharing is active as long as the NPC is not in reset.

### 11.6.5.7 Nexus Reset Control

The JCOMP input that is used as the primary reset signal for the NPC is also used by the NPC to generate a single-bit reset signal for other Nexus blocks. If JCOMP is negated, an internal reset is asserted, indicating that all Nexus modules should be held in reset. Internal Nexus reset is also asserted when the device is in censored mode.

### 11.6.5.8 System clock locked indication

Following a power-on reset, MDO[0] can be monitored to provide the lock status of the system clock. MDO[0] is driven to a logic 1 until the system clock achieves lock after exiting power-on reset. Once the system clock is locked, MDO[0] is negated and tools may begin Nexus configuration. Loss of lock conditions that occur subsequent to the exit of power-on reset and the initial lock of the system clock do not cause a Nexus reset, and therefore do not result in MDO[0] driven high.

### 11.6.5.9 Data Transmission via Nexus Aurora Link

As an alternative to data transmission on the Nexus auxiliary port, the NPC also supports data transmission over a high-speed serial Nexus Aurora Link (NAL). The NPC's role in Aurora Link data transmission is to route trace data to the NAL while continuing to manage arbitration between Nexus clients for the right to transmit data. In addition, the NPC monitors the NAL transmit queue and will halt further data transmission from Nexus clients if the queue is in danger of an overrun condition. In the event of an overrun condition, the NPC transmits a standard Nexus error message.

Once the PCR is configured for Aurora Link Mode (MCKO\_EN bit set, FPM bit set, ALC\_NUM\_LN set to non-zero value), the NPC waits for the NAL to acknowledge it is ready before starting data transmission. The NPC IDCODE message is the first message transmitted after Aurora Link mode is successfully configured and the NAL acknowledges it is ready to receive data. All data transmitted in Aurora Link mode is transmitted in frames, with each frame consisting of 8192 bytes of data. The first beat of each frame is accompanied by the assertion of the start of frame control signal, and the last beat of each frame is accompanied by the assertion of the end of frame control signal. Each beat of valid NAL data from the NPC is also accompanied by the assertion of the NAL data valid message signal.

Data received by the NAL is held in a FIFO until it can be sent out on the Aurora Link. The NPC keeps track of the NAL FIFO fill level. To help prevent an overrun of the NAL FIFO, the NPC holds off further grants to all clients if the NAL FIFO is filled above the watermark level. In the event that the NAL FIFO is overrun with data, the NPC transmits its FIFO overrun error message shown in [Table 11-13](#).

## 11.6.6 Initialization/Application Information

### 11.6.6.1 Accessing NPC tool-mapped registers

To initialize the TAP for Nexus register accesses, the following sequence is required:

1. Enable the Nexus TAP controller
2. Load the TAP controller with the NEXUS-ENABLE instruction

To write control data to NPC tool-mapped registers, the following sequence is required:

1. Write the 7-bit register index and set the write bit to select the register with a pass through the SELECT-DR-SCAN path in the TAP controller state machine.
2. Write the register value with a second pass through the SELECT-DR-SCAN path.  
Note that the prior value of this register is shifted out during the write.

To read status and control data from NPC tool-mapped registers, the following sequence is required:

1. Write the 7-bit register index and clear the write bit to select register with a pass through SELECT-DR-SCAN path in the TAP controller state machine.
2. Read the register value with a second pass through the SELECT-DR-SCAN path.  
Data shifted in is ignored.

See the IEEE-ISTO 5001 standard for more detail.

## 11.7 NPC Handshake

### 11.7.1 Overview

The NPC\_HNDSHK manages the low-power mode debug handshaking between the Nexus Port Controller (NPC) and the mode entry module (MC\_ME).

Figure 11-7. NPC\_HNDSHK block diagram

## 11.7.2 Features

The NPC\_HNDSHK supports:

- setting and clearing of the NPC PCR sync bit on low-power mode entry and exit
- putting the core into debug mode on low-power mode exit
- generating a falling edge on the JTAG TDO pad on low-power mode exit

## 11.7.3 Functional Description

### 11.7.3.1 Operation

The NPC\_HNDSHK implements the state machine shown in following figure. The states are described in the following table.

Figure 11-8. NPC\_HNDSHK state machine

Table 11-19. NPC\_HNDSHK state coding

| Value | State     | Description                                                            |
|-------|-----------|------------------------------------------------------------------------|
| 000   | IDLE      | wait for low-power mode entry request assertion                        |
| 001   | ENTRY_SET | set NPC PCR sync bit                                                   |
| 011   | ENTRY_CLR | wait for NPC PCR sync bit clear                                        |
| 010   | EXIT_WAIT | assert JTAG TDO pad and wait for low-power mode exit request assertion |
| 110   | DBG_EN    | enable core debug mode                                                 |
| 111   | TDO_SET   | deassert JTAG TDO pad and wait for NPC PCR bit set                     |
| 101   | EXIT_CLR  | clear NPC PCR sync bit and return TDO pad to normal functionality      |
| 100   | ACK_HOLD  | wait for low-power mode exit request deassertion                       |

## 11.8 Nexus Aurora interface

The Aurora interface allows Nexus protocol information to be transmitted serially at a high rate of speed over multiple Aurora lanes to provide advanced trace information from the device. The Aurora protocol handles the encoding of the data and striping the information across the lanes.

The Aurora information can be used to reconstruct events or operations that occurred inside the microcontroller. Nexus supports multiple trace clients within the MCU to all transmit information through a single Aurora port. Each Nexus message is tagged with the source client identifier and the type of message. The actual trace information that is available depends on the Nexus client and, generally, can be individually enabled (both the type of messages and which clients). The following table shows the different types of Nexus messages.

**Table 11-20. Types of Nexus messages**

| Message Type          | Description                                                                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Program Trace         | Nexus Program trace messages transmit any discontinuities in the program flow, such as branches and interrupts. Multiple types of messages can be generated.                           |
| Ownership Trace       | Ownership Trace provides information on process identification changes.                                                                                                                |
| Watchpoint Trace      | Watchpoint messages are generated anytime a watchpoint match occurs in the program or data flow. These can be programmed for many types of events within the MCU.                      |
| Device Identification | The device identification message allows information about the MCU to be transmitted on power up to allow tools to identify the target system MCU type.                                |
| Debug Status          | Debug status message provides additional information that may be needed to reconstruct software execution. Information such as if the device has entered debug mode or low power mode. |
| Data Acquisition      | Data Acquisition messages are an optional feature that allows software control of information to be transmitted.                                                                       |
| Error                 | Error messages are transmitted when an error condition occurs, such as internal buffer overflows.                                                                                      |

The Nexus trace information can be output to internal memory or the parallel information can be serialized for transmission over a serial type interface through the Nexus Aurora interface.

## 11.8.1 Nexus Aurora overview

The IEEE-ISTO 5001 standard added a new type of Auxiliary trace port that supports a higher bandwidth. This new interface type uses the Aurora protocol to reformat the parallel Nexus messages into one or more output serial lanes of data, where a lane is defined as a 2-pin Low Voltage Differential Signals (LVDS) interface. The protocol handles striping the data onto the multiple lanes. Each lane uses an 8B/10B encoded LVDS drivers. The encoding allows the receiver to recover clocking information.

The Aurora physical interface is based on XAUI (10 Gigabit Attachment Unit Interface used in communication protocols) and covers the jitter, differential skew, inter-lane skew, and bit error rate requirements.

The Aurora protocol covers lane initialization and channel bonding for both simplex and duplex implementations. The current implementation implements a simplex output only connection from the MCU to the external tool.

The Aurora interface connects Nexus parallel trace output to an Aurora Protocol Engine (APE), the Aurora Lane Control (ALC) and the Nexus Aurora Physical interface (NAP). The following figure is the Aurora interface block diagram, where the number of lanes,  $n$ , is 2.

Figure 11-9. Aurora interface block diagram

The Nexus blocks do not have memory mapped registers. The Nexus registers are accessed by the development tool via the JTAG port using a two step process. First, the specific block is selected by loading the corresponding ACCESS\_AUX instruction as described in [JTAGC ACCESS\\_AUX block instructions](#). Next, after the block is selected, the Nexus registers are enabled by loading the enable instruction to the JTAGC Instruction Register (IR). The enable instructions for the different Nexus clients are shown in the following table. After the enable instruction is received, the development tool has access to the Nexus registers of the selected client.

**Table 11-21. Nexus client JTAG enable instructions**

| Module         | Enable instruction | Opcode         |
|----------------|--------------------|----------------|
| Cores (e200z4) | CORE_ENABLE        | 0x7C (10 bits) |
| NXMC modules   | NEXUS_ENABLE       | 0x0 (4 bits)   |
| NPC            | NEXUS_ENABLE       | 0x0 (4 bits)   |
| NAL            | NEXUS_ENABLE       | 0xE (4 bits)   |

## 11.8.2 Nexus Aurora clocking

The supported clock frequency on the Aurora clock input has a valid range of 625 MHz to 1.25 GHz.

The Aurora interface requires the NAL and NAP to run with the same clock frequency as the cores for maximum bandwidth. For a 1.25 GBit/s data rate, the core frequency must be  $\geq 125$  MHz.

## 11.9 Nexus Aurora Link (NAL)

The Nexus Aurora Link (NAL) consists of all the logic on the MCU needed to implement the connection up to the physical-layer serializer and transmitter (no receiver). It includes Aurora control and data multiplexing, data-encoding and striping, and the Physical Coding Sublayer (PCS) portion of the protocol.

Debug data in the Nexus format from multiple clients is packetized into 32-bit format by the clients and then collected by the NPC. The NAL encodes the message data (8/10), stripes then across the lanes, and inserts Aurora control characters (such as start of message, end of message, idle, clock compensation characters and so on) around the payload. The NAL PCS drives the Nexus Aurora Physical (NAP) interface.

## 11.9.1 Chip-specific NAL information

Information about the NAL module on this chip includes the details in the following subsections.

### 11.9.1.1 Features

- Xilinx Aurora Protocol Specification V2.0 compliant.
- Two transmit-only lanes.
- Max data transmit rate = 2.5Gb/s with 2 transmit lanes running at 1.25 GHz.
- Cyclic Redundancy Checking (CRC) for error detection.
- Static (timer-based) channel training.
- Native and User Flow Control support.

### 11.9.1.2 NAL\_GSR reset value

On this chip, the reset value of NAL\_GSR is 0000\_2400h.

See [Nexus Aurora Link General Status Register \(NAL\\_GSR\)](#) for details about this register.

## 11.9.2 Modes of Operation

The operating mode of the Aurora Link is determined first by the main SOC control signals (reset, scan\_en). Its functional configuration is determined by the main SOC IO Port Control setting; functional operation is enabled by the PCR register in the NPC.

### 11.9.2.1 Reset

During reset all internal resources and queues are reset and all output ports are disabled. All inputs are ignored. Note that, since there is no tck-domain logic in the link itself, it is unaffected by treset.

Depending on the configuration, the link may power up upon exiting reset mode, if any Aurora lanes are enabled during reset.

### 11.9.2.2 Power-down

During purely functional operation, Nexus trace messaging is inhibited and clocks are disabled to the blocks of the Aurora Link. If the SOC exits POR-config with the Aurora channel disabled, the Aurora Link and any SerDes lanes dedicated to Aurora remain powered down. However, if the Link is powered down but the NPC is subsequently enabled with the Aurora channel active, the Link and dedicated SerDes lanes power up at this time.

### 11.9.2.3 Link Training

Before beginning functional operation, the Aurora Link must go through a training process to insure that both sides (SOC and debugger) can correctly reconstruct the transmitted data stream. The training process is outlined in the Aurora Protocol Specification, and consists of three sections: lane initialization, channel bonding, and channel verification. Training proceeds once the link powers up, and must complete successfully before data transmission can occur.

The NAL can be configured to initialize and train the Aurora link only in a simplex configuration. In training mode a timer based static-training method is used. The initialization and training sequence progresses from one step to the next via the use of programmable timers. A timer is programmed for each stage of training and as each timer expires, the training sequence can proceed to the next stage.

### 11.9.2.4 Aurora Transmit

During normal operation, the NPC will push data into the Aurora Link at a sufficiently high rate to insure that the link will not become data-starved even in its highest-bandwidth configuration (2 lanes operating at 1.25 GHz). The Link then performs the buffering, domain-crossing, data-packaging, and protocol translations to prepare the data stream for transmission through the NAP block.

## 11.9.3 Memory Map and Register Description

Configure the Aurora Link by programming the PCR register in the NPC and registers inside the NAL via JTAG accesses. Additional configuration registers within the link itself pertain to static training and debug modes. The link also has a read-only status register that provide information on channel training and general link operation.

- Nexus Aurora Link Status Register (NALGSR): The NALGSR register reflects general status of the Aurora link.
- Nexus Aurora Link Error Status Register (NALESR): The NALESR register reports error status in the Aurora link.
- NAL General Control Register (NALGCR): The NALGCR configures the behavior of the APE. It can be programmed to reset the Aurora channel, or to configure simplex/duplex initialization and to enable debug features.
- NAL Training Control Register (NALTCR): The NALTCR configures static training and timeout controls for the APE.

For more details about the register definition, see the Nexus Aurora Link (NAL) chapter.

## 11.10 Nexus Aurora PHY (NAP)

The Nexus Aurora PHY (NAP), in conjunction with the Nexus Aurora Link (NAL), supports one-way simplex high-speed serial communication with an external debugger. The NAP receives 8b/10b encoded data from the ALC block in the NAL and transmits this data onto a given PHY Lane's LVDS pads. The NAL performs lane striping with settings in the NAL and NPC specifying lane configuration. Each NAP lane consists of a Data Symbol Character Accumulator which registers the 10-bit character for that lane from the ALC on the rising edge of the NAL clock. A Serializer takes the 10-bit character and serializes it into the individual transmit data bits at the PHY clock rate to be transmitted via the LVDS output drivers to the external debugger receive channel.

### NOTE

The NAL performs static link training for an attached debugger's PHY. The NAP is not directly aware of the link training operation, since it merely transmits the data presented to it by the NAL.

On the receive data side of the external debugger, it is the responsibility of the external debugger to perform elastic buffering, symbol detection, symbol locking (called Lane Alignment in Aurora terminology), 10b/8b decoding, decode and disparity error tracking, and CRC checking in the received data stream.

The following figure shows a block diagram of the Nexus Aurora Physical (NAP) interface and the LVDS output drivers, where the number of lanes,  $n$ , is 2.

Figure 11-10. NAP block diagram

## 11.10.1 Features

The features of the NAP are as follows:

- Xilinx Aurora Protocol Specification V2.0 compliant
- Two differential transmit-only lanes
- Max data transmit rate of 2.5 Gb/s with two transmit lanes running at 1.25 GHz
- Simplex mode with static (timer-based) channel training

## 11.10.2 Modes of operation

The operating mode of the NAP is determined by the SoC control signals. The functional configuration is determined by the NPC PCR and NAL internal register settings; functional operation is enabled by the NPC.

### 11.10.2.1 Reset

During Nexus Reset all internal NAP resources are reset; all output ports are disabled, and all inputs are ignored. Since there is no SoC clock domain logic in the NAP itself, the NAP is unaffected by SoC system reset. Depending on the NAP configuration settings, the NAP may activate upon exiting Nexus Reset if any Aurora lanes are enabled during this reset mode, else it remains disabled and inactive.

### 11.10.2.2 Disabled/Enabled

The NAP is disabled when it comes out of reset if the SoC is configured for pure SoC functional mode operation with Nexus trace messaging inhibited. The Aurora LVDS transmit lanes also remain powered down. In addition, any time the NAP block enable is negated the NAP is disabled and the LVDS transmit lanes powered down. Conversely, if the NAP is enabled when it comes out of reset or enabled sometime later after reset is negated, the NAP channels become active and the LVDS output lanes are powered on to transmit Nexus trace data.

### 11.10.2.3 Link training

Before beginning trace output mode operation, the Aurora Link must go through a training process conducted by the NAL to insure that an external debugger can correctly reconstruct the transmitted data stream. Training proceeds once the link powers up, and must complete successfully before data transmission can occur.

The NAL initializes and trains the Aurora Link in a simplex configuration using a timer based static-training method. The initialization and training sequence described in Aurora Protocol Specification progresses from one step to the next via the use of programmable timers contained in the NAL. A timer is programmed for each stage of training and as each timer expires, the training sequence proceeds to the next stage until complete. The NAP is not directly aware of the link training operation, since it merely transmits the data presented to it by the NAL.

### 11.10.2.4 Transmit

During Nexus trace output operation, it is the responsibility of the NPC to push data into the Aurora Link at a sufficiently high rate to insure that the link does not become data-starved even in its highest-bandwidth configuration. The NAL and NAP support only two Tx lane configuration. The number of Tx lanes available is configured at reset.

### 11.10.3 Signals

The following table correlates module-level signal names (shown in the NAP's dedicated chapter) and the corresponding chip-level names (shown in the Signal Description chapter).

**Table 11-22. NAP signals**

| Module signal name | Chip signal name | Direction | Description                                               |
|--------------------|------------------|-----------|-----------------------------------------------------------|
| PHY_CLOCK          | AUR_RXCLK_N      | Input     | Aurora Receive clock, Negative differential pair (LVDS)   |
|                    | AUR_RXCLK_P      | Input     | Aurora Receive clock, Positive differential pair (LVDS)   |
| TX Data0           | AUR_TX0_N        | Output    | Aurora Transmit lane 0, Negative differential pair (LVDS) |
|                    | AUR_TX0_P        | Output    | Aurora Transmit lane 0, Positive differential pair (LVDS) |
| TX Data1           | AUR_TX1_N        | Output    | Aurora Transmit lane 1, Negative differential pair (LVDS) |
|                    | AUR_TX1_P        | Output    | Aurora Transmit lane 1, Positive differential pair (LVDS) |

## 11.11 Nexus clients

Nexus supports multiple trace clients within the device to all transmit information through a single Aurora port.

**Table 11-23. Reference links to related information**

| Related module                            | Reference                                                 |
|-------------------------------------------|-----------------------------------------------------------|
| e200z4 Nexus Support                      | <a href="#">e200z4 Nexus 3 Module</a>                     |
| Nexus Crossbar Multi-Master Client (NXMC) | <a href="#">Nexus Crossbar Multi-master Client (NXMC)</a> |

The following table lists all possible clients that can create trace messages in the device and the SRC IDs used.

**Table 11-24. Trace message SRC IDs used**

| Client                                                   | SRC ID used in trace messages |
|----------------------------------------------------------|-------------------------------|
| NPC (Aurora link overrun error message)                  | 0xF                           |
| e200z4 Nexus                                             | 0x0                           |
| Nexus Crossbar Multi-Master Client 0 (DMA/SIPI/Ethernet) | 0xC                           |
| Nexus Crossbar Multi-Master Client 1 (FlexRay)           | 0xD                           |

### 11.11.1 e200z4 Nexus 3

The Nexus3 module provides real-time development capabilities for e200z4d processors in compliance with the IEEE-ISTO 5001 standard. This module provides development support capabilities without requiring the use of address and data pins for internal visibility.

The development features supported are Program Trace, Data Trace, Watchpoint Messaging, Ownership Trace, Data Acquisition Messaging, and Read/Write Access via the JTAG interface. The Nexus3 module also supports two Class 4 features: Watchpoint Triggering, and Processor Overrun Control.

### 11.11.2 Nexus Crossbar Multi-master Client (NXMC)

The Nexus Crossbar Multi-master Client (NXMC) module provides real-time trace capabilities in compliance with the IEEE-ISTO 5001 standard. This module provides development support capabilities for SoCs without requiring address and data pins for internal visibility. A portion of the pin interface is also compliant with the IEEE1149.1-2001 JTAG standard.

To provide Nexus data trace messaging from bus masters on the master ports of the crossbar (XBAR) that do not inherently have a trace client, a Nexus Crossbar Multi-Master Client (NXMC) is implemented that monitors traffic into the master port of the XBAR. Two NXMCs are implemented, for the M5 and M6 master ports at the XBAR. Trace messages transmitted over the Nexus interface include which NXMC generated the message, as well as an identifier of the pre-concentrator source of the message.

This device has two available instances of the NXMC module:

- NXMC0 is attached to AHB master port M5 and traces accesses to DMA/SIPI/Ethernet peripherals; the message SRC ID is Ch (see also [Table 11-24](#))
- NXMC1 is attached to AHB master port M6 and traces accesses to the FlexRay; the message SRC ID is Dh (see also [Table 11-24](#))

#### 11.11.2.1 Features

The NXMC module is compliant with the IEEE-ISTO 5001 standard. The following features are supported:

- Data trace via Data Write Messaging (DWM) and Data Read Messaging (DRM). This provides the capability for the development tool to trace reads and/or writes to (selected) internal memory resources.
- Multi-master tracing capability for multiple master accesses
- Watchpoint trigger enable of data trace messaging
- Registers for data trace, watchpoint generation, and watchpoint trigger
- All features controllable and configurable via the JTAG port

### 11.11.2.2 External signal description

This section details information regarding the standard ports and protocol. The NXMCpin interface provides the function of transmitting messages from the messages queues to the NPC. It is also responsible for handshaking with the message queues.

The NXMC module implements the following signals:

- One  $\overline{\text{EVTI}}$  (Event In)
- One  $\overline{\text{EVTO}}$  (Watchpoint Event Out)
- Two  $\overline{\text{MSEO}}$  (Message Start/End Out)
- 4 MDOs (Message Data Out) or Aurora Output
- One MCKO (Message Clock Out)

The output ports are synchronized to the Nexus output clock (MCKO).

All NXMC input functionality is controlled through the JTAG port in compliance with IEEE 1149.1 (see Section 11.9.3.2, IEEE 1149.1 (JTAG) Test Access Port for details). A separate JTAG TAP controller is instantiated within the NXMC.

### 11.11.2.3 Supported messages and TCODEs

The NXMC pins allow for flexible transfer operations via public messages. A TCODE defines the transfer format, the number and/or size of the packets to be transferred, and the purpose of each packet. The IEEE-ISTO 5001-2003 standard defines a set of public messages. The NXMC block supports the public TCODEs listed in the following table. The SRC and MASTER field values are described in the device-specific chapter that describes how the modules are configured.

Table 11-25. Supported public TCODEs

| Message name                          | Min packet size (bits) | Max packet size (bits) | Packet name | Packet type | Packet description                                         |
|---------------------------------------|------------------------|------------------------|-------------|-------------|------------------------------------------------------------|
| Data Trace -<br>Data Write<br>Message | 6                      | 6                      | TCODE       | fixed       | TCODE number = 36                                          |
|                                       | 4                      | 4                      | SRC         | fixed       | Source processor identifier (multiple Nexus configuration) |
|                                       | 4                      | 4                      | MASTER      | fixed       | Indicates which master (ID) initiated the data access      |
|                                       | 3                      | 3                      | DSZ         | fixed       | Data size (See <a href="#">Table 11-26</a> )               |
|                                       | 1                      | 32                     | U-ADDR      | variable    | Unique portion of the data write address                   |
|                                       | 8                      | 64                     | DATA        | fixed       | Data write value (size fixed based on DSZ field)           |
| Data Trace -<br>Data Read<br>Message  | 6                      | 6                      | TCODE       | fixed       | TCODE number = 37                                          |
|                                       | 4                      | 4                      | SRC         | fixed       | Source processor identifier (multiple Nexus configuration) |
|                                       | 4                      | 4                      | MASTER      | fixed       | Indicates which master (ID) initiated the data access      |
|                                       | 3                      | 3                      | DSZ         | fixed       | Data size (See <a href="#">Table 11-26</a> )               |
|                                       | 1                      | 32                     | U-ADDR      | variable    | Unique portion of the data read address                    |
|                                       | 8                      | 64                     | DATA        | fixed       | Data read value (size fixed based on DSZ field)            |
| Error Message                         | 6                      | 6                      | TCODE       | fixed       | TCODE number = 8                                           |
|                                       | 4                      | 4                      | SRC         | fixed       | Source processor identifier (multiple Nexus configuration) |
|                                       | 4                      | 4                      | ETYPE       | fixed       | Error type (See <a href="#">Table 11-27</a> )              |

### 11.11.2.4 NXMC register map

This section describes the NXMC register definition. Nexus registers are accessed using the JTAG port in compliance with IEEE 1149.1. See [IEEE 1149.1 \(JTAG\) Test Access Port](#) for details. The complete memory map appears in the following table.

**Table 11-29. NXMC register map**

| Nexus register                                 | Nexus access opcode | Read/write | Read address | Write address |
|------------------------------------------------|---------------------|------------|--------------|---------------|
| Development Control 1 (DC1)                    | \$2                 | R/W        | \$04         | \$05          |
| Development Control 2 (DC2)                    | \$3                 | R/W        | \$06         | \$07          |
| Watchpoint Trigger (WT)                        | \$B                 | R/W        | \$16         | \$17          |
| Data Trace Control (DTC)                       | \$D                 | R/W        | \$1A         | \$1B          |
| Data Trace Start Address1 (DTSA1)              | \$E                 | R/W        | \$1C         | \$1D          |
| Data Trace Start Address2 (DTSA2)              | \$F                 | R/W        | \$1E         | \$1F          |
| Data Trace End Address1 (DTEA1)                | \$12                | R/W        | \$24         | \$25          |
| Data Trace End Address2 (DTEA2)                | \$13                | R/W        | \$26         | \$27          |
| Breakpoint/Watchpoint Control Register1 (BWC1) | \$16                | R/W        | \$2C         | \$2D          |
| Breakpoint/Watchpoint Control Register2 (BWC2) | \$17                | R/W        | \$2E         | \$2F          |
| Breakpoint/Watchpoint Address Register1 (BWA1) | \$1E                | R/W        | \$3C         | \$3D          |
| Breakpoint/Watchpoint Address Register2 (BWA2) | \$1F                | R/W        | \$3E         | \$3F          |
| Reserved                                       | \$20-\$3F           | -          | \$40-\$7E    | \$41-\$7F     |

### 11.11.2.5 NXMC register descriptions

Detailed register definitions for the current NXMC implementation are described in the chapter Nexus Crossbar Multi-Master Client (NXMC).

## 11.11.3 Functional description

### 11.11.3.1 Programming considerations (RESET)

If NXMC register configuration is to occur during system reset (as opposed to debug mode), all NXMC configuration should be completed between the negation of TRST and system reset de-assertion, after the JTAG ID register has been read by the tool.

### 11.11.3.2 IEEE 1149.1 (JTAG) Test Access Port

The NXMC module uses the IEEE 1149.1 TAP controller for accessing Nexus resources. The JTAG signals themselves are shared by all TAP controllers on the device. The NXMC module implements a 4-bit Instruction Register (IR). The valid instructions and method for register access are outlined in [NXMC register access via JTAG](#).

### 11.11.3.3 JTAG ID register

This JTAG ID Register (included in the NXMC module) provides key development attributes to the development tool concerning the NXMC block. This register is fixed and is accessed through the standard JTAG IR/DR paths.

**Figure 11-11. JTAG ID register**

The following table describes the JTAG ID register fields.

**Table 11-30. JTAG ID field descriptions**

| Field | Description                                                |
|-------|------------------------------------------------------------|
| 31:28 | Embedded Product Version Number, set to '0000'             |
| 27:22 | Freescale Design Center ID Number, set to restore '100110' |
| 21:20 | Embedded Product Sequence Number, set to '11'              |
| 19:12 | AHBMM Nexus Module ID, set to '01000101'                   |
| 11:1  | Manufacturer ID Number, set to '0000001110'                |
| 0     | Fixed per JTAG 1149.1                                      |

### 11.11.3.4 Enabling NXMC operation

The Nexus module is enabled by loading a single instruction (NEXUS-ACCESS =0x0) into the JTAG Instruction Register (IR). Once enabled, the module is ready to accept control input via the JTAG pins.

The NXMC module is disabled when the JTAG state machine reaches the Test-Logic-Reset state. This state can be reached by the assertion of the TRST pin or by cycling through the state machine using the TMS pin. The NXMC module is also disabled if a Power-on-Reset (POR) event occurs.

If the NXMC module is disabled, no trace output is provided, and the module disables the (drive inactive) auxiliary port output pins (MDO[30:0], MSEO[1:0], MCKO). NXMC registers are not available for reads or writes.

11.11.3.5 Enabling NXMC TAP controller

Assertion of a Power-on-Reset signal or assertion of the TRST pin resets all TAP controllers. Upon exit from the Test-Logic-Reset state, the IR value is loaded with the JTAG ID. When the NXMC TAP is accessed, this information helps the development tool obtain information about the Nexus module it is accessing, such as version, sequence, feature set, etc.

11.11.3.6 NXMC register access via JTAG

Access to Nexus register resources is enabled by loading a single instruction (NEXUS-ACCESS = 0x0) into the JTAG Instruction Register (IR).

Once the JTAG NEXUS-ACCESS instruction has been loaded, the JTAG port allows tool/target communications with all Nexus registers according to [Table 11-29](#).

Reading/writing of a NXMC register then requires two passes through the Data-Scan (DR) path of the JTAG state machine. See details about the IEEE 1149.1-2001 TAP Controller Finite State Machine.

- 1. The first pass through the DR selects the Nexus register to be accessed by providing an index (see [Table 11-29](#)) and the direction (read/write). This is achieved by loading an 8-bit value into the JTAG Data Register (DR). This register has the format shown in the following figure and table.

Table 11-32. JTAG DR field description for Nexus register access

| Field | Description |
|-------|-------------|
|-------|-------------|

Table continues on the next page...

**Table 11-32. JTAG DR field description for Nexus register access (continued)**

|                      |                                                     |
|----------------------|-----------------------------------------------------|
| Nexus Register Index | Selected from values in <a href="#">Table 11-29</a> |
| Read/Write (R/W)     | 0 Read<br>1 Write                                   |

2. The second pass through the DR then shifts the data in or out of the JTAG port, LSB first.
  - a. During a read access, data is latched from the selected Nexus register when the JTAG state machine (see IEEE 1149.1-2001 TAP Controller Finite State Machine) passes through the Capture-DR state.
  - b. During a write access, data is latched into the selected Nexus register when the JTAG state machine (see IEEE 1149.1-2001 TAP Controller Finite State Machine) passes through the Update-DR state.

### 11.11.3.7 Data trace

This section describes with the data trace mechanism supported by the NXMC module. Data trace is implemented via Data Write Messaging (DWM) and Data Read Messaging (DRM), as per the IEEE-ISTO 5001 standard.

#### 11.11.3.7.1 Data trace messaging (DTM)

NXMC data trace messaging is accomplished by snooping the system bus, and storing the information for qualifying accesses (based on enabled features and matching target addresses). The NXMC module traces all data access that meet the selected range and attributes.

#### 11.11.3.7.2 DTM message formats

The NXMC block supports five types of DTM messages:

- Data write
- Data read
- Data write synchronization
- Data read synchronization
- Error messages

### 11.11.3.7.3 Enabling DTM operation

Data trace messaging can be enabled in one of three ways:

- Setting the TM field of the DC1 Register via JTAG to enable data trace.
- Using the DTS field of the WT Register to enable data trace on watchpoint hits (either watchpoints configured within the NXMC module or external watchpoint inputs controlled by the device).
- By toggling the external start control, which in turn sets the TM field of the DC1 register to enable data trace. (The TM bit clears and hence the data tracing stops on the toggle of external stop control. In case of conflict between JTAG write and external start/stop control, JTAG write takes precedence.

#### NOTE

In case of enabling the DTM, either via JTAG or external start/stop control, it is important to make sure that all the other controls (i.e. DTC, DTSA/E1/2 and WT register fields) needs to be configured with right values in order to ensure correct DTM functioning.

### 11.11.3.7.4 DTM queueing

The NXMC implements a programmable depth queue for queuing all messages. Messages that enter the queue are transmitted via the auxiliary pins in the order in which they are queued.

#### NOTE

If multiple trace messages need to be queued at the same time, watchpoint messages have the highest priority (WPM > DTM).

### 11.11.3.7.5 Relative addressing

The relative address feature is compliant with IEEE-ISTO 5001 and is designed to reduce the number of bits transmitted for addresses of data trace messages. The address transmitted is relative to the address of the previous data trace message. It is generated by XORing the new address with the previous address, and then using only the results up to the most significant 1 in the result. To recreate this address, an XOR of the (most-significant 0-padded) message address with the previously decoded address gives the current address.

### 11.11.3.7.6 Data trace windowing

Data write/read messages are enabled via the RWT1(2) field in the Data Trace Control Register (DTC) for each DTM channel. Data trace windowing is achieved via the address range defined by the DTEA and DTSA Registers and by the RC1(2) field in the DTC. All system bus DMA initiated read/write accesses which fall inside or outside these address ranges, as programmed, are candidates to be traced.

### 11.11.3.7.7 System bus cycle special cases

The system bus cycle special cases are shown in following table.

**Table 11-33. System Bus cycle special cases**

| Special case                             | Action                         |
|------------------------------------------|--------------------------------|
| System bus cycle with data error         | Data trace message discarded   |
| System bus cycle completed without error | Cycle captured and transmitted |
| System bus cycle is an instruction fetch | Cycle ignored                  |

### 11.11.3.7.8 System bus multi-master tracing

DTM tracing can be done either for all the masters or for a single master (indicated by the MID field of the DTC register) based on the DTC register MME field. In case of single master, the correct value needs to be configured in the MID register before enabling the data trace operation.

The MASTER field of the DTM message indicates the system bus master for which the trace has been generated. For each masters (0 to 15) there is a parameter associated (MSID0-15) for indicating its actual ID, which finally gets inserted in the MASTER field. The MASTER field values are described in the device-specific chapter that describes how the modules are configured.

### 11.11.3.8 Watchpoint support

The NXMC module provides watchpoint messaging via the auxiliary pins, as defined by IEEE-ISTO 5001-2003. Watchpoint messages can be generated by either using the NXMC defined internal watchpoints or by externally defined watchpoint signals.

### 11.11.3.8.1 Watchpoint messaging

Enabling watchpoint messaging is accomplished by setting the WEN bit in the DC1 Register. This bit is set either via JTAG write 1 access and cleared via JTAG write 0 access.

#### NOTE

In case of enabling the watchpoint messaging, it is important to make sure that all the other Watch Point Message (WPM) controls (i.e. BWC1/2, BWA1/2 register fields) are configured with the correct values in order to ensure correct WPM operation.

Watchpoint setting is supported by using the BWC1(2) registers, two independently controlled internal watchpoints can be initialized. When a AHB access address matches on BWA1(2), a watchpoint message is transmitted. The system bus multi-master or single master controls applies here too, as explained for DTM (in "System bus multi-master tracing").

The Nexus module provides watchpoint messaging using the IEEE-ISTO 5001 defined TCODE. When a watchpoint source asserts, a message is sent to the queue to be messaged out. This message indicates the watchpoint number as shown in the following figure and table.

**Table 11-34. Watchpoint message format (fixed length = 18 bits)**

| 8 bits           | 4 bits | 6 bits         |
|------------------|--------|----------------|
| WPHIT (RRRRXXXX) | SRC    | TCODE (001111) |

**Table 11-35. Watchpoint source description**

| Watchpoint source (8 bits) | Watchpoint description              |
|----------------------------|-------------------------------------|
| RRRRXXX1                   | reserved                            |
| RRRRXX1X                   | reserved                            |
| RRRRX1XX                   | Internal Watchpoint #1 (BWA1 match) |
| RRRR1XXX                   | Internal Watchpoint #2 (BWA2 match) |

### 11.11.3.8.2 Watchpoint error message

An error message occurs when a new message cannot be queued due to the message queue being full. The FIFO discards messages until it has completely emptied the queue. Once emptied, an error message is queued. The error encoding indicates which type(s) of messages attempted to be queued while the FIFO was being emptied.

If only a watchpoint message attempts to enter the queue while it is being emptied, the error message incorporates the watchpoint only error encoding (ECODE = 00000000000001). If a data trace message also attempts to enter the queue while it is being emptied, the error message incorporates error encoding (00000000000011). Error information is messaged out in the format shown in Figure 29.

**Table 11-36. Error message format (fixed length = 28 bits)**

| 14 bits | 4 bits | 4 bits | 6 bits         |
|---------|--------|--------|----------------|
| ECODE   | ETYPE  | SRC    | TCODE (001000) |

# Chapter 12

## Power Management

### 12.1 Overview

MPC5744P microcontroller includes a robust power management infrastructure that enables applications to select among various operational and low-power modes and to monitor internal voltages for high- and low-voltage conditions. The monitoring capability is also used to ensure supply voltages and internal voltages are within the required ranges before the microcontroller can leave RESET. This chapter gives an overview of the built-in power management features.

The power management infrastructure comprises the following modules:

- Power Control Unit (MC\_PCU)
- Power Management Controller (PMC)

**Figure 12-1. Power Management Overview**

This chapter describes the modules interaction in brief. For complete details, see the respective module chapters.

### 12.1.1 Power Control Unit (PCU)

The Power Control Unit (PCU) is used mainly to map the Power Management Controller (PMC) registers into the PCU address space. These registers control the different low voltage detect options and power options for the device. On the MPC5744P device there is only one single power domain, therefore reducing power by switching off different areas of the device is not an option. There are low power modes which can be used, namely HALT and STOP for this purpose.

### 12.1.2 Power Management Controller (PMC)

The Power Management Controller implements a linear voltage regulator to generate the core logic supply from a 3.3 V (nominal) input supply and monitors various supply voltages of the MPC5744P chip for functional safety purpose. Depending on the supply voltages, power-on-reset (POR) and destructive resets are generated.

The PMC connects to the Reset Generation Module (MC\_RGM), the Fault Collection Control Unit (FCCU) and the flash memory controller. The on-chip ADC receives signals from PMC for diagnostic purposes.

### 12.1.3 Supply Concept

MPC5744P provides on-chip regulator to derive the core supply from external 3.3 V supply. A power transistor must be added on the PCB. See the MPC5744P Data Sheet for specifics on this device. Alternatively, an external linear or switching regulator can be used. The analog supply needs to be protected from noise on digital supply at least by means of decoupling capacitor. Better filters can be used if they do not affect regulator stability. A separate regulator for analog supply is preferred.

The PMC monitors each supply voltage and releases the resets when they are within the limits of operating conditions. The power-on-reset can be generated on-chip or can be provided from external source, such as brown-out device.

Some supplies may already be connected internally inside the package depending on the package type, mainly in order to save pins in low pin-count packages.

Figure 12-2. Supply concept

### 12.1.4 Power Modes

MPC5744P does not support ultra-low power modes that require power gating or separate power domains. The core logic implements stop and low frequency power saving modes, which may result in core current steps. The effect needs to be mitigated by a smoother frequency ramps instead of instantaneous change to avoid triggering LVD or HVD by under/overshoots.

## 12.1.5 External Supply

The internal supply regulator becomes inactive when an external Low Dropout Register (LDO) is used. The Bipolar Junction Transistor (BJT) should be removed in that case. It can be assumed that the internal regulator has no undesirable impact if ballast BJT is not present. The internal regulator can be switched off by setting the PMC module's PMCCR[INT\_REG\_BYPASS] field to 1.

## 12.1.6 Power Management Supply Description

The following table lists the PMC supply signals.

**Table 12-1. Power management controller external signals**

| Name         | Type              | Description                                                                                                |
|--------------|-------------------|------------------------------------------------------------------------------------------------------------|
| VDD_HV_ADRE0 | Reference         | ADC0 High reference voltage                                                                                |
| VDD_HV_ADRE1 | Reference         | ADC1 High reference voltage                                                                                |
| VDD_HV_ADV   | Supply            | High voltage supply for the ADC modules                                                                    |
| VDD_HV_IO    | Supply            | High voltage Power supply for the I/Os                                                                     |
| VDD_HV_PMC   | Supply            | High voltage power supply for internal power management unit                                               |
| VDD_HV_OSC0  | Supply            | High voltage power supply for the internal oscillator                                                      |
| VDD_LV_LFAST | Supply            | Low voltage power supply for the LFAST module                                                              |
| VDD_LV_PLL   | Supply            | Low voltage power supply for the PLL module                                                                |
| VDD_LV_NEXUS | Supply            | Low voltage power supply for the Nexus module                                                              |
| VSS_LV       | Ground            | Ground supply for the device / I/O. This is covering both VSS_LV and VSS_HV in case of exposed pad device. |
| VSS_LV_LFAST | Ground            | Ground supply for the LFAST module                                                                         |
| VSS_LV_NEXUS | Ground            | Ground supply for the Nexus module                                                                         |
| VSS_HV_IO    | Ground            | Ground supply for the device I/O.                                                                          |
| VSS_HV_OSC0  | Ground            | Ground supply for the internal oscillator module                                                           |
| VSS_HV_ADRE0 | Ground/ Reference | ADC0 Ground and low reference voltage                                                                      |
| VSS_HV_ADRE1 | Ground/ Reference | ADC1 Ground and low reference voltage                                                                      |
| VSS_HV_ADV   | Supply            | Ground supply for the ADC modules                                                                          |

## 12.1.7 Voltage Monitoring

The PMC senses the supply voltages continuously to keep the chip in safe operating range. Destructive resets or alternatively, interrupts are triggered, when the voltage exceeds or falls below the limits defined by recommended electrical operating conditions.

### 12.1.7.1 Core Supply Monitor

The digital core supply range is compared with a low and high voltage limit.

Figure 12-3. Core Supply Monitoring

The digital core is able to operate between the limits given by the MPC5744P Data Sheet. The lower limit is reduced by the amount of on-chip IR drop, that must be granted. The upper limit is defined by the beginning of lifetime degradation.

The available range for external supply voltage is further restricted by the tolerance of high (HVD) and low voltage monitors (LVD). See the MPC5744P Data Sheet for exact values. To ensure safe operating conditions for core the LVDs/HVDs are calibrated. Calibration of LVD/HVD takes places after the core is in functional safe operating range. It is performed in a way that LVD/HVD cover the allowed core operating range, i.e. by increasing the minimum value for LVD and decreasing the maximum value for HVD.

HVD checks the core supply for exceeding an upper limit. It has a 5% uncalibrated tolerance that can be reduced to ~1.5% by calibration. LVD checks the core supply for exceeding a lower limit. It has a 5% uncalibrated tolerance that can be reduced to ~1.5% by calibration.

If LVD and HVD are disabled, the external core supply can have an extended operating range. External voltage monitors shall be used in that case to ensure functional safety.

The core LVD/HVDs are duplicated for use at two different design points (LVD\_CORE and LVD\_CORE\_BK or HVD\_CORE and HVD\_CORE\_BK). The core supply is sensed at one external supply feed point and the IR drop critical point.

The core LVD/HVDs shall provide sufficient hysteresis or low-pass characteristic to prevent bouncing in case of short core supply over/undershoots.

### 12.1.7.2 IO, REG and other 3.3 V Supplies Monitor

All other 3.3 V, non-core supplies are compared to a lower limit only by means of LVDs. The following table lists the LVDs for the MPC5744P device.

All 3.3 V supplied modules must remain fully functional in an extended operating range that includes the LVD calibrated tolerance. The 3.3 V LVDs have 5% uncalibrated and 2% calibrated tolerance. Calibration takes place when the core supply is within a safe operating range. After calibration, the typical LVD value is centered within the recommended operating conditions low limit and the safe operating conditions low limit to provide margins for supply undershoots.

If LVDs are disabled, external voltage monitors shall be used to ensure functional safety. The LVDs shall provide sufficient hysteresis or low-pass characteristic to prevent bouncing in case of short 3.3 V supply undershoots.

**Table 12-2. List of 3.3 V Low Voltage Detect Monitors**

| LVD Supply Monitored | Voltage Supply |
|----------------------|----------------|
| LVD IO               | 3.3 V          |
| LVD VDDREG           | 3.3 V          |
| LVD VDDFLASH         | 3.3 V          |
| LVD VDDADC           | 3.3 V          |

**Figure 12-4. 3.3V Supply Monitoring**

## 12.1.8 Power-on Reset

The Power-on Reset (POR) Generator is required to initialize the chip during supply rise. It is a voltage monitor which detects if a supply exceeds a defined threshold voltage level. The POR checks the core voltage supply VDD12\_COR and the regulator supply VDD\_HV\_REG. When both supplies have a reliable level for the operation of the PMC and RESET generator, the LVDs/HVDs are activated.

The POR watches the rising edge of the supply before the recommended operating conditions are reached. The POR functions correctly even if the supply voltage is non-monotonic. It includes sufficient hysteresis to avoid bouncing in case of slow supply ramps. Within the safe operating conditions, the LVDs/HVDs take control over reset generation.

The POR must hold the device in reset regardless of how slow the supply rise time is, until the point at which the POR is designed to release. The rate of rise of a battery supply is described in an industry standard specification, ISO 16750-2. The slow ramp up / ramp down of battery supply and following VDD is specified as 0.9 V / sec.

## 12.1.9 Power-up Sequence

**Figure 12-5. OFLAG timing during non-continuous counting**

The power-up sequence runs whenever the system will get through a power cycle or external reset.

When the VDD33\_REG voltage exceeds the POR\_REG rising edge threshold, all 3.3V LVDs are reset to their uncalibrated state and armed. The core voltage regulator CORE\_REG starts to work and the core supply voltage rises.

When the core voltage crosses the POR\_CORE rising edge threshold, the core LVDs and HVDs are reset to their uncalibrated state and armed.

When the core supply and the regulator voltage reach their minimum value according to the recommended operating conditions, the system reset is released and the system boot process starts. The LVDs/HVDs are now calibrated to provide tighter limits for voltage over/undershoot detection.

As soon as core or any 3.3V supply falls below the limit of the corresponding LVD thresholds, a destructive reset is triggered. The system is held in reset state until all LVD threshold levels are exceeded again. If the core voltage exceeds the threshold of the HVD, a destructive reset is asserted. It is released when the core voltage falls below the HVD threshold.

When core or regulator supply fall below the POR\_CORE or POR\_REG falling edge limit, respectively, the system is reset and core supply is disabled. The chip will restart with a complete power-up cycle.

### **12.1.10 ADC Interface**

The ADC interface provides the PMC internal voltages for diagnostic purpose. The analog multiplexer and the buffer is inside the PMC. The SAR ADC converts the selected voltage, which can then be evaluated by the CPU.

### **12.1.11 Safety Measures**

The PMC implements a self-test architecture. The self-test can be triggered by test program or software. It is executed automatically with each power-cycle. The self-test will generate non-critical faults, which are collected in the FCCU module. The LVD/HVDs allow also error injection by SW, for artificially triggering an error in FCCU.

Parts of the PMC design that can act as a single point of failure are replicated, such as the analog voltage reference generation circuits.

Various internal voltages can be monitored during PMC operation, with assistance of the ADC.

The PMC provides a signal that keeps the I/O pads in a reset condition if either the core supply or the IO supply is out of the valid operating range.

# Chapter 13

## Clocking

### 13.1 Introduction

This chapter describes the architecture for the system level clocks and includes the following information:

- System clock specifics
- Clock architecture
- Clock sources
- Clock monitoring
- Programmable clock dividers
- Clock control registers
- Progressive Clock Switching

#### NOTE

This chapter covers only clocks that are generated on the device. Protocol clocks that are provided by external devices are covered in the respective chapters where they are used.

The clock (system clock) for the cores, memories, and debug logic is independent from the peripheral clocks. This independence allows the system clock to be a frequency-modulated clock to reduce electromagnetic emissions while preserving a precise clock for peripheral timer and communication functions. It also allows the system clock to be reduced during low computational activity periods while maintaining timer and communication link operation.

The MPC5744P boots from the 16 MHz internal RC oscillator (IRCOSC) and uses it as a backup clock (if a backup clock is enabled) in the event of a PLL or oscillator failure.

There are three possible ways to provide the source clock:

- External oscillator
- External crystal
- 16 MHz internal RC oscillator

From one of these input sources, the internal clocks are generated from one of the two PLLs, PLL0 and PLL1, PLL0\_PHI and PLL1\_PHI, respectively. These two clocks, along with the XOSC and IRCOSC, can be selected to drive system peripherals depending on the configuration of the Auxiliary Clock Selectors. The PHI1 output of PLL0 can also be used as the clock source for PLL1. A total of seven clock selectors allows developers to select the PLL reference clocks, drive various system peripherals with an independent clock source, and select a clock source to drive the CLKOUT signal for off-chip use. There is also one additional clock selector which is used exclusively for the system clock.

Each of the outputs of the module clock selectors has up to three dividers, which allows for even more clock frequency granularity with division factors up to 64 for a given group of peripherals. On selected outputs of the clock dividers are Clock Monitor Units (CMU) that are used to test the integrity of the clocks making sure that their frequencies stay within necessary operating limits. If any of the five CMUs detects an issue with the clock signal that is being monitored, an interrupt or system reset could be generated, depending on how the CMUs are configured.

## 13.2 Clock generation

The top-level clock generation architecture appears in the following figure. All clock selectors and dividers in the figure are located and programmed in the Clock Generation Module (MC\_CGM). All dividers are integer dividers (1, 2, 3, ..., n) with the ranges given in the diagram.

### NOTE

CMU0...CMU4 in the figure use IRCOSC for their reference clock. However, the user can select XOSC as the reference in CMU0 for frequency measurement of IRCOSC.

**Note:** All dividers shown in the diagram (FCD not included) are integer dividers with a range of 1, 2, 3,..., n. All clock dividers are 50% duty cycle.

**Figure 13-1. Clock generation**

### NOTE

PLL1 is routed on N15P devices into the AUX Clock Selector 0. It is recommended not to enable Frequency modulation on

PLL1 when it is being used as a clock source for AUX Clock Selector 0.

### NOTE

See [Figure 13-4](#) for LFAST clocking details.

## 13.2.1 MC\_CGM registers

The following table shows the relationship between the clocks in [Figure 13-1](#) and the MC\_CGM registers.

### NOTE

See the Clock Generation Module (MC\_CGM) for specifics on register implementation.

**Table 13-1. MC\_CGM relationship to clocks**

| MC_CGM registers                | Register description                                              | Output clock                                                                                           | CMU                     |
|---------------------------------|-------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|-------------------------|

*Table continues on the next page...*

**Table 13-1. MC\_CGM relationship to clocks (continued)**

| MC_CGM registers | Register description                 | Output clock  | CMU |
|------------------|--------------------------------------|---------------|-----|
| MC_CGM_AC6_SC    | Aux Clock 6 Select Control           |               |     |
| MC_CGM_AC10_DC0  | Aux Clock 10 Divider Configuration 0 | ENET_CLK      | —   |
| MC_CGM_AC10_SC   | Aux Clock 10 Select Control          |               |     |
| MC_CGM_AC11_DC0  | Aux Clock 11 Divider Configuration 0 | ENET_TIME_CLK | —   |
| MC_CGM_AC11_SC   | Aux Clock 11 Select Control          |               |     |

1. Connected to the RCCU clock path (which is part of the Checker Core clock), after the branch of the clock line for Master and Checker Core and after the branch between Checker Core clock and RCCU clock.
2. Connected to the PBRIDGE1\_CLK (downstream from the common part of the clock tree for the Peripheral Bridges)

## 13.3 System clock frequency limitations

The maximum frequency of operation for the device system level clocks is given in the following table.

### NOTE

The user is responsible to verify that these values are not exceeded.

### NOTE

Each AIPS Bridge (PBRIDGE\_0, PBRIDGE\_1) is capable of clocking the AIPS interface of each peripheral slot individually at the XBAR frequency, or at the XBAR frequency divided by two.

**Table 13-2. Maximum system level clock frequencies**

| System clock                              | Max frequency (MHz) |
|-------------------------------------------|---------------------|
| Cores, NPC, NAL, MEMU (CHKR_CLK, SYS_CLK) | 200                 |
| XBAR (SYS_CLK)                            | 200                 |
| PBRIDGE_0, PBRIDGE_1, SIPI, DMA_CH_MUX    | 50                  |
| Motor control (MOTC_CLK)                  | 160                 |
| DMA, Interrupt Controller (HALFSYS_CLK)   | 100                 |
| ADCs                                      | 80                  |
| Sine Wave Generator (SGEN)                | 20                  |
| LFAST                                     | 320                 |
| FlexRay (FRAY_CLK)                        | 80                  |
| FlexCAN (CAN_CLK)                         | 80                  |
| SENT (SENT_CLK)                           | 80                  |
| Ethernet (AHB clock)                      | 100                 |

*Table continues on the next page...*

**Table 13-2. Maximum system level clock frequencies (continued)**

| System clock  | Max frequency (MHz)                |
|---------------|------------------------------------|
| ENET_CLK      | 50                                 |
| ENET_TIME_CLK | 50 (integer ns period requirement) |

In order to maintain synchronization between the different system clock branches (for example, SYS\_CLK output from the System Clock Selector), there are limitations on the frequencies of those clocks. The system clocks must be binary multiples of each other with the frequency relationships described in the electrical specifications.

### 13.3.1 JTAG Frequencies

The following table shows the maximum frequencies of the JTAG interface.

**Table 13-3. JTAG Frequencies**

| Configuration               | e200z4 Max Internal JTAG Frequency | Maximum External JTAG Frequency                                           | Notes                                                                              |
|-----------------------------|------------------------------------|---------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| Unconfigured clock          | -                                  | See electrical characteristics for maximum usable external JTAG frequency | Assumes 16 MHz clock with +/- 1.5% tolerance, and JTAG usable at 1/2 CPU frequency |
| Clock configured to 180 MHz | 90 MHz                             |                                                                           | JTAG usable at 1/2 CPU frequency                                                   |

## 13.4 Default clock configuration

At power up, the IRCOSC is the default clock for the entire system. All system clock dividers are set to divide by two at power-on reset.

## 13.5 Clock sources

The following clock sources are described in this section:

- PLL0
- PLL1 (FMPLL)
- External Oscillator (XOSC)
- External Clock (EXTAL Bypass)
- 16 MHz Internal RC Oscillator (IRCOSC)

## 13.5.1 PLL

The PLL system in the MPC5744P is a Dual PLL that provides separate system and peripheral clocks. The PLLs are disabled after power on and must be enabled by software. The block diagram for the Dual PLL appears in the following figure.

Figure 13-2. MPC5744P Dual PLL digital interface block diagram

### 13.5.1.1 PLL0 - base PLL (non-FM)

PLL0 is the primary PLL. This PLL is used to source a non-Frequency Modulated clock to the MPC5744P modules and also the reference clock to PLL1.

#### 13.5.1.1.1 PLL0 input clocks

The possible input clock sources for PLL0 are the XOSC, IRCOSC, and EXTAL Bypass. The EXTAL Bypass input is the EXTAL pin. AUX Clock Selector 3 selects which input clock will be used as the source for PLL0. The selection between XOSC and EXTAL Bypass is made via the XOSC\_CTL register of the XOSC module.

#### 13.5.1.1.2 PLL0 output clocks

The output clocks from PLL0 are PHI and PHI1. The PHI output clock drives various peripheral clocks and the system clock when selected in the MC\_CGM. The PHI1 output provides one of the input references for PLL1.

### 13.5.1.2 PLL1 - FMPLL

PLL1 is a Frequency Modulated PLL (FMPLL) that is typically used to drive the system clock. PHI is the output of PLL1 which drives the System Clock Selector and AUX Clock Selector 6 of the MC\_CGM.

#### 13.5.1.2.1 PLL1 input clocks

The possible input clock sources for PLL1 are XOSC, PLL0\_PHI, and EXTAL Bypass. The EXTAL Bypass input is the EXTAL pin, which "bypasses" the XOSC output. AUX Clock Selector 4 selects which input clock is used as the source for PLL1. The selection between XOSC and EXTAL Bypass is made via the XOSC\_CTL register of the XOSC module.

#### 13.5.1.2.2 PLL1 output clocks

The output clock from PLL1 is the PHI clock, which can drive the system clock if the System Clock Selector of the MC\_CGM is configured to do so. The PHI output clock contains a fractional divider that can be applied to the loop divide of the PLL to achieve good granularity in the PLL1 PHI output clock frequency.

#### 13.5.1.2.3 PLL register interface

This device has a single digital interface for the dual PLLs. The digital interface provides register control of all features of the PLLs. Details are provided in the "Dual PLL Digital Interface" chapter.

### 13.5.1.3 PLL register reset values

All reset values for the PLLDIG registers that are device specific are shown in the following table. All other register reset values are shown in the Dual PLL Digital Interface chapter.

**Table 13-4. Dual PLL Digital Interface register reset values**

| Offset<br>(hex) | Register                       | Reset Value<br>(hex) |
|-----------------|--------------------------------|----------------------|
| 0008            | PLL0DV - PLL0 Divider Register | 0000_0000h           |
| 0028            | PLL1DV - PLL1 Divider Register | 0000_0000h           |

### 13.5.1.4 PLLDIG initialization information

Coming out of reset PLL0 and PLL1 are disabled per the DRUN mode configuration register, MC\_ME\_DRUN\_MC.

1. Configure PLL0 and related modules.
  - a. With PLL0 disabled, program PLL0 clock source in MC\_CGM\_AC3\_SC[SELCTL]. Default source is 16 MHz IRCOSC. Write MC\_CGM\_AC3\_SC[SELCTL] = 1 to select XOSC as source.
  - b. Program PLL0DV[PREDIV], PLL0DV[RFDPHI1], PLL0DV[MFD] and PLL0DV[RFDPHI].
  - c. If desired, modify the XOSC\_CTL[EOCV] to adjust the external oscillator stabilization count, used when the external oscillator is turned on (by the MC\_ME).
  - d. If necessary, modify the CMU frequency meter values (CMU\_MDR and CMU\_FDR) used to monitor the XOSC frequency. XOSC frequency is compared to the IRCOSC source when XOSC is turned on.
2. Turn on XOSC and PLL0.
  - a. Configure a mode configuration for turning on PLL0 and XOSC. In a mode configuration register (for example, MC\_ME\_DRUN\_MC) set MC\_ME\_<mode>\_MC[XOSCON] = 1 and MC\_ME\_<mode>\_MC[PLL0ON] = 1. If desired, also set MC\_ME\_<mode>\_MC[SYSCLK] = 2 for this new mode configuration to use PLL0 (PLL0:PHI output) as the sysclk.
  - b. Enter that mode by two writes to MC\_ME\_CTRL register to enter that mode. This is required even if entering the same mode.
3. Wait for the mode transition to complete.
  - a. Wait for the mode transition to complete by polling MC\_ME\_GS[S\_MTRANS] or enabling an interrupt for flag MC\_ME\_IS[I\_MTC]. A timer, even if it is the watchdog, should be used to make sure the mode transition completes. Mode transition will NOT complete until:
    - XOSC counter expires (if the new mode configuration changes MC\_ME\_<mode>\_MC[XOSCON] = 1), and
    - PLL is locked (if the new mode configuration changes MC\_ME\_<mode>\_MC[PLL0ON] = 1)

- b. Confirm the desired target mode was entered by checking the status of MC\_ME\_GS[S\_CURRENT\_MODE].
4. Configure PLL1 and related modules.
  - a. With PLL1 disabled, program PLL1 clock source in MC\_CGM\_AC4\_SC[SELCTL]. Default is MC\_CGM\_AC4\_SC[SELCTL] = 1 which selects XOSC.
  - b. Program PLL1DV[MFD] and PLL1DV[RFDPHI].
  - c. If required, program the PLL1FM register with the desired frequency modulation parameters and enable FM modulation, PLL1FM[MODEN] = 1. The PLL1FM register must not be written after PLL1 is enabled and operating in normal mode.
5. Turn on PLL1.
  - a. Configure a mode configuration for turning on PLL1, and keeping XOSC and PLL0 on. In a mode configuration register (for example, MC\_ME\_DRUN\_MC), initialize MC\_ME\_<mode>\_MC[XOSCON] = 1, MC\_ME\_<mode>\_MC[PLL0ON] = 1 and MC\_ME\_<mode>\_MC[PLL1ON] = 1. If desired, also set MC\_ME\_<mode>\_MC[SYSCLK] = 4 for this new mode configuration to use PLL1 as the sysclk.
  - b. Enter that mode by two writes to ME\_CTRL register to enter that mode. This is required even if re-entering the same mode.
6. Wait for the mode transition to complete.
  - a. Wait for the mode transition to complete by polling MC\_ME\_GS[S\_TRANS] or enabling an interrupt for flag MC\_ME\_IS[I\_MTC]. A timer, even if it is the watchdog, should be used to make sure the mode transition completes. Mode transition will NOT complete until:
    - XOSC counter expires (if the new mode configuration changes XOSCON to 1), and
    - PLL1 is locked (if the new mode configuration changes MC\_ME\_<mode>\_MC[PLL1ON] = 1).
  - b. Confirm the desired target mode was entered by checking the status of MC\_ME\_GS[S\_CURRENT\_MODE].

**NOTE**

See the "Mode Entry Module (MC\_ME)" chapter in this *Reference Manual* more details.

## 13.5.2 External oscillator (XOSC)

The external oscillator (XOSC) is provided as a reference for the on-chip PLLs. It can also be used as a clock source to the ADCs, SGEN, motor control modules, LFAST, and PLL reference as well as a system clock source. It is available for observation on either of the CLKOUT pins, and is used as a reference to calibrate the IRCOSC frequency.

The external oscillator allows a crystal or external clock to be used as the reference clock for the microcontroller. The XOSC has the following features:

- Reference clock to PLL0 and PLL1
- Reference clock to CMU0 (IRCOSC trimming)
- Option to drive the CAN and FlexRay protocol clocks directly from the XOSC
- Provides support for 8 MHz to 44 MHz crystal inputs

### 13.5.2.1 XOSC reset value

The following table shows the default reset value for the XOSC registers.

**Table 13-5. XOSC register reset values**

| Offset | Register                       | Reset Value |
|--------|--------------------------------|-------------|
| 0x00   | XOSC_CTL-XOSC Control Register | 0030_0000h  |

## 13.5.3 16 MHz internal RC oscillator (IRCOSC)

The microcontroller has a 16 MHz internal RC oscillator which is always enabled and can be used as the clock source for the PLLs. It is used as the clock source for the MC\_RGM, FCCU, PIT, SWT, and SIUL2 input filters, and it can also be used as a clock source for the ADCs, SGEN, motor control modules, and system clock. The IRCOSC is the default system clock after reset. The register interface is used for user trimming of the oscillator.

### 13.5.3.1 IRCOSC register interface

This device has a dedicated digital interface for the IRCOSC. The digital interface provides a register for fine tuning the IRCOSC frequency by the user. Other registers allow reading of the settings of IRCOSC temperature sensor, voltage regulator and capacitor trimming values that are set by the factory. The IRCOSC is always enabled when the device is powered.

### 13.5.3.2 IRCOSC trimming

The IRCOSC requires trimming to meet accuracy requirements. During the initial phases of a reset sequence triggered by a power-on or destructive reset, the IRCOSC runs at its untrimmed frequency value. A trim value that was determined during factory test, and subsequently stored in flash memory, is loaded during reset via the SSCM to the IRCOSC\_CTL[USER\_TRIM] (see the "IRCOSC Digital Interface" chapter for details).

## 13.6 Peripheral clocks

The following figure shows the clock distribution to the core and peripheral modules.

Figure 13-3. Clock distribution

**NOTE**

Before Disabling the clock from root (source), make sure that all the peripherals that are using the clock are switched OFF or at least that clock is not selected as source of Peripheral clock. For Example:- In FlexCAN when XOSC is selected for the

CAN Engine Clock Source (FLEXCAN\_CTRL[CLKSRC]), before disabling FlexCAN Peripheral Clock, the user must ensure XOSC is enabled during the target mode transition i.e. XOSC must be enabled for the target mode. After the FlexCAN Peripheral Clock is switched OFF user can disable XOSC clock.

### 13.6.1 LFAST clocking

The MPC5744P includes an LFAST module to support high speed device communications. A single LFAST PLL, which requires a 10-20 MHz reference, supports high speed operation of the LFAST module. For low speed LFAST operation, the reference clock is used directly by the LFAST module.

The LFAST PLL requires a 20 MHz reference. The source may be the PLL0\_PHI or the external oscillator (XOSC) or input from the external LFAST device via the LFAST\_REF\_CLK package pin. When this reference clock is generated internally, it can also be output on the LFAST\_REF\_CLK pin. The LFAST\_REF\_CLK pin connection appears in the following figure. Input/Output direction of the LFAST\_REF\_CLK pin is controlled by the MSCR in the SIUL2.

Figure 13-4. Device LFAST SysClk

### 13.6.2 FlexRay clocking

The FlexRay protocol clock is sourced from either the non-FM PLL0\_PHI clock or the external oscillator (XOSC). Select between these sources by programming the FlexRay module's FR\_MCR[CLKSEL] field.

- When using the external oscillator clock, a 40 MHz crystal is required for proper operation.
- When using PLL0\_PHI, the MC\_CGM\_AC1\_DC0 register must be configured to provide 80 MHz on FRAY\_PLL\_CLK for proper operation.
  - The frequency of the PLL source must be double the frequency of the XOSC source because the PLL has a less stable duty cycle.
  - The FlexRay module itself divides the PLL frequency to provide a steady, 50% duty cycle, 40 MHz clock internally.
  - This internal FlexRay divider is driven automatically when FR\_MCR[CLKSEL] is 1. The user cannot change this internal divider or select it for the XOSC source.

### 13.6.3 FlexCAN clocking

The CAN\_CLK is generated from either the XOSC or PLL0\_PHI clock. The PLL0\_PHI clock can be divided by a value written to the CGM\_AC2\_DC register in the MC\_CGM. The output of this divider (CAN\_PLL\_CLK) drives one of two inputs of a multiplexer. The other input is driven by XOSC. FlexCAN\_CTRL1[CLK\_SRC] selects whether CAN\_PLL\_CLK or XOSC clock drives the output of the multiplexer for the CAN\_CLK.

## 13.7 Clock monitoring

For all safety critical clocks, the microcontroller detects a missing clock or incorrect frequency. To achieve this clock monitoring units (CMUs) are used. Each CMU is programmed independently. The IRCOSC is used as the clock monitor references. Detailed information on the CMUs can be found in the Clock Monitor Unit chapter.

### 13.7.1 CMU configuration

This section explains the CMU configuration.

Figure 13-5 shows the block diagram for CMU0 on the MPC5744P.

**Figure 13-5. CMU0 Block Diagram**

Figure 13-6 shows the block diagram for CMU[1:4] on the MPC5744P.

**Figure 13-6. CMU[1:4] Block Diagram**

### 13.7.1.1 Clock input sources

Table 13-6 shows the clocks that are monitored by each CMU. These signals are connected internally on the chip, but are not accessible via pins on the boundary of the device. IRCOSC is the reference clock for all clock monitors. Only CMU0 implements the XOSC monitor. CMU0 uses the IRCOSC clock to measure if the XOSC is too low. CMU0 can also be used to calibrate the IRCOSC frequency using the XOSC. All other CMUs are configured identically.

**Table 13-6. Clock input sources**

| Clock module | Monitored clock                          |
|--------------|------------------------------------------|
| CMU0         | MOTC_CLK (CLKMN1 for CMU0), XOSC, IRCOSC |
| CMU1         | CHKR_CLK                                 |
| CMU2         | PBRIDGE0_CLK, PBRIDGE1_CLK               |
| CMU3         | ADC_CLK                                  |
| CMU4         | SENT_CLK                                 |

### 13.7.1.2 CMU registers and field availability

Table 13-7 specifies which registers and fields are available on a given CMU for this device.

**Table 13-7. CMU registers availability**

| Address Offset | Register   | CMU  | Note                                                                                                                      |
|----------------|------------|------|---------------------------------------------------------------------------------------------------------------------------|
| 0x0000         | CMU_CSR    | All  | CMU_CSR[SFM] and CMU_CSR[CKSEL1] apply in CMU0 only.<br>For all CMU instances on this chip, CMU_CSR[RCDIV] resets to 11b. |
| 0x0004         | CMU_FDR    | CMU0 | —                                                                                                                         |
| 0x0008         | CMU_HFREFR | All  | —                                                                                                                         |
| 0x000C         | CMU_LFREFR | All  | —                                                                                                                         |
| 0x0010         | CMU_ISR    | All  | CMU_ISR[OLRI] is in CMU0 only.                                                                                            |
| 0x0014         | Reserved   | —    | —                                                                                                                         |
| 0x0018         | CMU_MDR    | CMU0 | —                                                                                                                         |

### 13.7.2 External oscillator (XOSC) monitor

The XOSC frequency is compared to a minimum value limit. If the measured XOSC frequency is below the limit, a flag is set, and an interrupt is generated, if enabled. Frequency limits are give in the MPC5744P Data Sheet.

### 13.7.3 Internal RC oscillator (IRCOSC) monitor

The period of the IRCOSC can be measured in CMU0, using the XOSC as a reference. This allows for application trimming of the IRCOSC frequency.

### 13.7.4 System clock monitors

A CMU is assigned to monitor the frequency of the checker core, both Peripheral bridges, motor control, ADC and SENT clocks (see [Figure 13-1](#)).

#### 13.7.4.1 Monitor control and behavior

Software can program an upper and lower limit of the expected clock frequency. If the monitor is enabled and the measured frequency is above or below the limits, a flag bit is set, and an interrupt will be generated, if enabled. The default condition of the clock monitor is disabled.

## 13.8 Loss of clock sources behavior

This device has built-in mechanisms for detecting loss of the oscillator or PLL clocks, and it provides several options for reaction to a loss of clock in the application. [Figure 13-7](#) provides a high-level view of the logic of the loss of clock sources.

### 13.8.1 Loss of PLL/XOSC clock

As shown in [Figure 13-7](#), each loss of lock signal from the PLL and XOSC failure signals are monitored by the FCCU. For the event when a clock failure occurs, the FCCU can be programmed to generate a short or long reset sequence or simply to generate an interrupt. In the case of the interrupt, only the unpredictable free running clock is still provided by the PLL. There is no automatic system clock switch in this case, and the user is required

to program the switch through the Mode Entry module (MC\_ME). Therefore, it is strongly recommended that the interrupt reaction to a PLL loss of lock is not selected when the PLL is used as the source of the system clock.

If a long or short reset is selected: the PLL, XOSC, MC\_ME, and MC\_CGM are reset to their default states, and the system clock is switched to the IRCOSC.

### 13.8.2 Loss of IRCOSC clock

The frequency of the IRCOSC clock is monitored by the frequency meter in CMU\_0. There is no automated trigger of an FCCU error condition if the IRCOSC fails. Since the IRCOSC is the boot and backup clock, a failure is a catastrophic failure.

Each CMU's FHH and FLL event indicators are connected solely to the FCCU. In this regard, CMU\_0's connection to the FCCU in the following figure represents all CMU instances.

Figure 13-7. Loss of clock sources

### 13.8.3 PLL loss of lock interrupt

Always write 1 to both PLL0CR[LOLIE] and PLL1CR[LOLIE] to keep the loss of lock interrupt function enabled.

The main interrupt functionality is determined by the FCCU via fault input NCF[24] for PLL0 and fault input NCF[25] for PLL1.

# Chapter 14

## e200z4d Core Complex Overview

### 14.1 Introduction

The main computational shell consists of Main Core\_0, which uses an e200z4251n3 core. A second core, referred to as Checker Core\_0s, is an e200z424 core that is a true subset of the e200z4251n3 core. When enabled, Checker Core\_0s operates in lock step mode with Main Core\_0, executing exactly the same instructions as Main Core\_0. Thus, Checker Core\_0s checks to insure that Main Core\_0 is executing correctly. This chapter provides overviews of the e200z4251n3 core and the e200z424 core.

The e200z4251n3 and the e200z424 cores are very similar. The register set for these cores is identical. The e200z424 core differs in hardware from the e200z4251n3 in that no Instruction Cache, Data Cache, or D-memory is implemented.

### 14.2 Overview of e200z4251n3 and e200z424 cores

The e200z processor family is a set of CPU cores that implement low-cost versions of the Power architecture.

The e200z4251n3 and e200z424 are dual-issue, 32-bit Power VLE compliant designs with 32-bit general purpose registers (GPRs).

An Embedded Floating-point (EFPU2) APU is provided to support real-time single-precision embedded numeric operations using the general-purpose registers.

The e200z4251n3 and e200z424 cores implement the VLE (variable-length encoding) ISA, providing improved code density. The VLE ISA is further documented in PowerISA 2.06, a separate document. The base *PowerISA 2.06* fixed-length 32-bit instruction set is not directly supported.

The e200z4251n3 and e200z424 processor cores integrate a pair of integer execution units, a branch control unit, instruction fetch unit, load/store unit, and a multi-ported register file capable of sustaining six read and three write operations per clock. Most integer instructions execute in a single clock cycle. Branch target prefetching is performed by the branch unit to allow single-cycle branches in many cases.

A Nexus Class 3+ module is integrated into each e200z4251n3 and e200z424 processor core.

A Memory Protection Unit is integrated in each e200z4251n3 and e200z424 processor core.

## 14.3 Features

The following is a list of some of the key features of the e200z4251n3 and e200z424 processor cores:

- Dual issue, 32-bit *PowerISA 2.06*-VLE compliant CPU
- In-order execution and retirement
- Precise exception handling
- Branch processing unit
  - Dedicated branch address calculation adder
  - Branch target prefetching using BTB
- Load/store unit
  - 2 cycle load latency
  - Fully pipelined
  - Misaligned access support
- 32-bit General Purpose Register (GPR) file
- Dual AHB 2.v6 64-bit System buses
- Local Data Memory (DMEM) with shared AHB 2.v6 64-bit slave interface
  - e200z4251n3 core: 64 KB DMEM
  - e200z424 core does not contain either Instruction or Data MEM
- Memory Protection Unit (MPU) implementing a 24-entry region descriptor table with support for 6 arbitrary-sized instruction memory regions, 12 arbitrary-sized data memory regions, and 6 additional arbitrary-sized instruction or data memory regions
- 2-Way Set Associative Harvard Instruction and Data Cache
  - e200z4251n3 core: 8 KB ICache, 4 KB DCache
  - e200z424 core does not contain either Instruction or Data Cache
- Embedded Floating-point APU (EFPU2) supporting single-precision floating-point operations
- Lightweight Signal Processing Extension (LSP) APU to support real-time SIMD fixed-point embedded numerics operations using the GPRs
- Performance Monitor APU supporting execution profiling

- Nexus Class 3+ Real-time Development Unit
- Power management
  - Low power design with extensive clock gating
  - Power saving modes: halt, stop, wait
  - Dynamic power management of execution units, caches and Local memories
- Testability
  - Synthesizeable, MuxD scan design
  - ABIST/MBIST for arrays
  - Built-in LBIST unit

## 14.4 Microarchitecture summary

The e200z4251n3 and e200z424 processor cores utilize a five stage instruction pipeline with two stages for execution. The Instruction Fetch, Instruction Decode/Register File Read/EA Calc, Execute0/Memory Access0, Execute1/Memory Access1, and Register Writeback stages operate in an overlapped fashion allowing single clock instruction execution for most instructions. The following figure shows a block diagram of the e200z architecture.

**Figure 14-1. e200z block diagram**

The integer execution units each consists of a 32-bit Arithmetic Unit (AU), a Logic Unit (LU), a 32-bit Barrel shifter (Shifter), a Mask-Insertion Unit (MIU), a Condition Register manipulation Unit (CRU), a Count-Leading-Zeros unit (CLZ), and result feed-forward hardware. Integer EU1 also supports hardware division and a 32x32 Hardware Multiplier array.

Most arithmetic and logical operations are executed in a single cycle with the exception of multiply, which is implemented with a pipelined hardware array, and the divide instructions. A Count-Leading-Zeros unit operates in a single clock cycle.

The Instruction Unit contains a PC incrementer and dedicated Branch Address adders to minimize delays during change of flow operations. Sequential prefetching is performed to ensure a supply of instructions into the execution pipeline. Branch target prefetching is performed to accelerate taken branches. Prefetched instructions are placed into an instruction buffer.

Branch target addresses are calculated in parallel with branch instruction decode, resulting in an execution time of two clocks for correctly predicted branches. Conditional branches which are not taken execute in a single clock. Branches with successful BTB target prefetching have an effective execution time of one clock if correctly predicted.

Memory load and store operations are provided for byte, halfword, word (32-bit), and doubleword data with automatic zero or sign extension of byte and halfword load data as well as optional byte reversal of data. These instructions can be pipelined to allow effective single cycle throughput. Load and store multiple word instructions allow low overhead context save and restore operations and use 64-bit data transfers when possible. The load/store unit contains a dedicated effective address adder to allow effective address generation to be optimized.

The Condition Register unit supports the condition register (CR) and condition register operations defined by the Power architecture. The condition register consists of eight 4-bit fields that reflect the results of certain operations, such as move, integer and floating-point compare, arithmetic, and logical instructions, and provide a mechanism for testing and branching.

Vectored and autovectored interrupts are supported by the CPU. Vectored interrupt support is provided to allow multiple interrupt sources to have unique interrupt handlers invoked with no software overhead.

The LSP APU supports vector instructions operating on 16- and 32-bit fixed-point data types. The EFPU2 APU supports 32-bit IEEE-754 single-precision floating-point formats, supports scalar single-precision floating-point operations, and operates in a pipelined fashion. The general purpose register file is used for source and destination operands, and a unified storage model is used for scalar single-precision floating-point data types of 32-bits and the normal integer type. Low latency fixed-point and floating-point add, subtract, mixed add/subtract, sum, diff, min, max, multiply, multiply-add, multiply-sub, divide, square root, compare, and conversion operations are provided, and most operations can be pipelined.

### 14.4.1 Instruction unit features

The features of the e200z4251n3 and e200z424 Instruction units are:

- 64-bit path to cache supports fetching of two 32-bit instructions per clock
- Instruction buffer holds up to eight 32-bit instructions
- Dedicated PC incrementer supporting instruction prefetches
- Branch unit with dedicated branch address adder and branch lookahead logic (BTB) supporting single cycle execution of successfully predicted branches

### 14.4.2 Integer unit features

The e200z4251n3 and e200z424 integer units support single cycle execution of most integer instructions:

- 32-bit AU for arithmetic and comparison operations
- 32-bit LU for logical operations
- 32-bit priority encoder for the count leading zero's function
- 32-bit single cycle barrel shifter for static shifts and rotates
- 32-bit mask unit for data masking and insertion
- Divider logic for signed and unsigned divide in 4-14 clocks with minimized execution timing (EU1 only)
- Pipelined 32x32 hardware multiplier array supports 32x32->32 multiply with 2 clock latency, 1 clock throughput (EU1 only)

### 14.4.3 Load/Store unit features

The e200z4251n3 and e200z424 load/store units support load, store, and the load multiple / store multiple instructions:

- 32-bit effective address adder for data memory address calculations
- Pipelined operation supports throughput of one load or store operation per cycle
- Dedicated 64-bit interface to memory supports saving and restoring of up to two registers per cycle for load multiple and store multiple word instructions and context save/restore instructions

### 14.4.4 EFPU2 Floating-Point Unit features

The EFPU2 embedded floating-point unit supports pipelined operation of most floating-point operations, allowing a throughput of one FP operation per cycle, and supports a variety of operations:

- Supports IEEE754 single-precision data format
- Supports IEEE754 half-precision format for conversion <-> single-precision format

- EFPU2 instructions utilize the 32-bit GPRs for minimized context save/restore overhead
- Provides low latency pipelined scalar floating-point add, subtract, add/sub, sub/add, multiply, multiply-add, min, max, absolute value, compare, and conversion instructions with single-cycle throughput
- Default results mode for real-time applications allows for exception-free operations when underflow or overflows occur
- Trap Enable controls allow for trapping of various operation exceptions and emulation of IEEE754 boundary case results
- Floating-point Divide and Square root logic operating in 13 (FP div) and 11 (FP sqrt) clocks

### 14.4.5 LSP Lightweight Signal Processing Unit features

The LSP APU is designed to accelerate signal processing applications normally suited to DSP operation.

- LSP instructions operate on the 32-bit GPRs
- Supports SIMD integer operations: arithmetic, logical, shift
- Supports SIMD rounding, saturation, pack, unpack, merge, extract, select for efficient data manipulation
- Supports SIMD multiply/multiply accumulate/ dot product operations
- 16-, 32-, and (limited) 64-bit signed and unsigned integer data types
- 16- and 32-bit signed fractional support (1.15, 1.31 representations)
- Guarded 32-bit and 64-bit signed fractional support (9.23, 33.31, and 17.47 representations)
- Single-cycle throughput for all instructions (except frac divide)
- Supports fractional divide operations (32/32->32)
- Specialized operations such as field manipulation and count-leading
- Supports specialized load/store operations with integrated data manipulation
- Multiple addressing modes supported including circular and bit-reversed addressing
- Sustained throughput of up to 2 16x16-bit multiply/accumulate operations per cycle.

### 14.4.6 MPU features

The features of the MPU are as follows:

- 24-entry fully-associative Range Table
- Arbitrary range size support from 1 byte to 4 GB
- 8-bit Process Identifier
- Bypass capability for individual access types
- Maskable Address and Process Identifier

- Programmable Memory Attributes
- Entry Invalidation Protection
- Write-Once Option
- Alternate Debug Breakpoint/Watchpoint function

### 14.4.7 Cache features

The features of the caches are as follows:

- 2-Way Set Associative Harvard Instruction and Data Caches
  - e200z4251n3: 8 KB ICache, 4 KB DCache
  - e200z424: no ICache, no DCache
- Writethrough Support
- 8-entry Store Buffer
- Linefill Buffer
- 32-bit address bus plus attributes and control
- Separate uni-directional 64-bit read data bus and 64-bit write data bus
- Support for Way locking
- Support for Write allocation policies
- Support for multi-bit EDC with Correction/Auto-invalidation capability for the I and D caches
- Hardware Debug Cache Invalidate Support for the Data Cache
- Software and Hardware Debug access to cache tag, status and data storage via dedicated control registers

### 14.4.8 Local memory features

The features of the local data memories are as follows:

- Local data memories (DMEM) with shared AHB 2.v6 64-bit slave interface
  - e200z4251n3: 64 KB DMEM
  - e200z424: no IMEM, no DMEM
- 1 wait-state slave DMEM read access, 1 wait-state slave DMEM write access
- 64-bit local bus to CPU supporting 0 wait-state CPU access
- Support for multi-bit (SECDED) ECC with correction/scrubbing capability
- 4-entry ECC R-M-W Store Buffer for DMEM
- 32-bit address bus plus attributes and control
- Separate uni-directional 64-bit read data bus and (for DMEM only) 64-bit write data bus

### 14.4.9 Performance Monitor Unit features

The features of the performance monitor include:

- Four configurable 32-bit performance monitor counters, each capable of counting selected CPU subsystem events
- Performance Monitor interrupt
- Ability to configure performance monitor resources for debugger use
- Hardware input signals for qualification of counting by individual counters
- Hardware output signals to indicate counter overflows
- Dedicated watchpoint outputs for each counter with programmable periodicity
- Trigger On/Off control for each counter based on subsystem events
- Multiple selectable event types including # of clocks, CPU stall cycles, # of instructions completed, # of interrupts taken, # of memory accesses (by type), # of instruction or data cache misses, # of cycles with 0, 1, or 2 instructions issued, # of instructions in a given class completed (ldst, branch, integer, FP, and so on), and cache linefills

### 14.4.10 e200z4251n3 system bus features

The features of the e200z4251n3 system bus interface include:

- Independent instruction and data interfaces
- Advanced microcontroller bus architecture (AMBA) AHB2.v6 protocol
- 32-bit address buses, 64-bit instruction-side and data-side system buses
- Data interface provides separate uni-directional read and write data buses
- Support for HCLK running at a slower rate than CPU clock

### 14.4.11 e200z424 system features

Checker Core\_0 is implemented using an e200z424 core. When enabled, Checker Core\_0s is used in lock step with Main\_Core\_0. The e200z424 core can only be enabled or disabled by the user. For this device, the Checker Core\_0s has no system bus and cannot independently execute user code. The core is only used to execute the same instruction stream as Main Core 0.

The e200z424 core is identical to the e200z4251n3 with five exceptions:

- IMEM memory array is not present
- ICache memory array is not present
- DMEM memory array is not present
- DCache memory array is not present
- e200z424 has a pair of system bus interfaces, which are driven/sampled by the delayed lock step logic

## Chapter 15

# Core Detailed Description

### 15.1 Overview of the e200z4251n3 core

#### NOTE

For the chip-specific implementation details of this module's instances, see the chip configuration information.

The e200z4251n3 is a dual-issue 32-bit *Power ISA 2.06* VLE compliant design with 32-bit general-purpose registers (GPRs). The e200z4251n3 core implements the VLE (variable-length encoding) ISA, providing improved code density. The VLE ISA is further documented in *Power ISA 2.06*, a separate document.

An Embedded Floating-point (EFPU2) APU is provided to support real-time single-precision floating-point embedded numerics operations using the general-purpose registers.

A Lightweight Signal Processing Extension (LSP) APU is provided to support real-time SIMD fixed-point embedded numerics operations using the general-purpose registers. All arithmetic instructions that execute in the core operate on data in the general purpose registers (GPRs). The GPRs support register pairing in order to support vector instructions defined by the LSP APU. These instructions operate on a vector pair of 16-bit or 32-bit data types, and deliver 16-bit vector and 32-bit scalar results. A wide variety of data manipulation, multiply, multiply/accumulate, and dot product instructions along with specialized memory access instructions allow a sustained throughput of up to two 16x16-bit multiply/accumulate operations per cycle.

The e200z4251n3 core integrates a pair of integer execution units, a branch control unit, instruction fetch unit, load/store unit, and a multi-ported register file capable of sustaining six read and three write operations per clock cycle. Most integer instructions execute in a single clock cycle. Branch target prefetching is performed by the branch unit to allow single-cycle branches in many cases.

The e200z4251n3 core contains an 8 KB Instruction Cache, and a 4 KB Data Cache, as well as a Nexus Class 3+ real-time debug module with support for program and data trace features as well as extensive trace controls.

A Memory Protection Unit that protects various instruction and data memory areas is also included.

## 15.2 Register model

This section describes the registers implemented in the e200z4251n3 core. The *Power ISA 2.06* architecture defines register-to-register operations for all computational instructions.

e200z4251n3 extends usage of the general purpose registers to support EFPU /LSP APU operations on the 32-bit GPR registers.

[Figure 15-1](#) and [Figure 15-2](#) show the complete e200z4251n3 register set, all of which are accessible in supervisor mode. [Figure 15-3](#) and [Figure 15-4](#) show the subset of registers accessible in user mode. The number to the right of the special-purpose registers (SPRs) is the decimal number used in the instruction syntax to access the register (for example, the integer exception register (XER) is SPR 1).

## SUPERVISOR Mode Programmer's Model SPRs

1. These core-specific registers may not be supported by other Power Architecture processors.
2. Not implemented.

Figure 15-1. e200z4251n3 Supervisor Mode Programmer's Model SPRs

## 15.2.1 Branch Unit Control and Status Register (BUCSR)

The BUCSR register is used for general control and status of the branch target buffer (BTB). The BTB is detailed in . The BUCSR is shown in the following figure.

**Figure 15-5. Branch Unit Control and Status Register (BUCSR)**

The BUCSR fields are defined in the following table.

**Table 15-1. Branch Unit Control and Status Register (BUCSR)**

| Bits             | Name   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 29:30<br>[61:62] | BPRED  | Branch Prediction Control (Static). This field controls operation of static prediction mechanism on a BTB miss. When a branch is predicted as taken, fetching of the predicted target location will be performed for branch acceleration. BPRED operates independently of BPEN, and with a BPEN setting of 0, will be used to perform static prediction of all unresolved branches.<br><br>00 Branch predicted taken on BTB miss for all branches.<br>01 Branch predicted taken on BTB miss only for forward branches.<br>10 Branch predicted taken on BTB miss only for backward branches.<br>11 Branch predicted not taken on BTB miss for both branch directions.<br><br><b>NOTE:</b> BPRED functionality is not supported in e200z4xxx processor cores due to its short pipe stages. |
| 31<br>[63]       | BPEN   | Branch target buffer prediction enable. When the BPEN bit is cleared, no hits will be generated from the BTB, and no new entries will be allocated. Entries are not automatically invalidated when BPEN is cleared; the BBFI bit controls entry invalidation. BPEN operates independently of BPRED, and will be used even with a BPRED setting of 00.                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 15-1. Branch Unit Control and Status Register (BUCSR)**

| Bits | Name | Description                                                                 |
|------|------|-----------------------------------------------------------------------------|
|      |      | 0 Branch target buffer prediction disabled                                  |
|      |      | 1 Branch target buffer prediction enabled (enables BTB to predict branches) |

## 15.3 Dual-issue operation

The instruction issue unit attempts to issue a pair of instructions to the execution units each cycle. Source operands for each of the instructions are provided from the GPRs or from the operand feed-forward muxes. Data or resource hazards may create stall conditions that cause instruction issue to be stalled for one or more cycles until the hazard is eliminated.

The execution units write the result of a finished instruction onto the proper result bus and into the destination registers. The writeback logic retires an instruction when the instruction has finished execution. As many as three results can be simultaneously written.

Two execution units are provided to allow dual issue of most instructions. Only a single load/store unit is provided. Only a single integer multiply and divide unit is provided, thus a pair of multiply or divide instructions cannot issue simultaneously. In addition, the divide unit is blocking.

The following table shows the concurrent instruction issue capabilities. Note that data dependencies between instructions will generally preclude dual-issue of those instructions.

**Table 15-2. Concurrent instruction issue capabilities**

| Class of instruction | Branch | Load/Store | Scalar integer   | Scalar float | Special |
|----------------------|--------|------------|------------------|--------------|---------|
| Branch               | —      | yes        | yes              | yes          | —       |
| Load/Store           | yes    | —          | yes              | yes          | —       |
| Scalar integer       | yes    | yes        | yes <sup>1</sup> | yes          | —       |
| Scalar float         | yes    | yes        | yes <sup>2</sup> | —            | —       |
| Special              | —      | —          | —                | —            | —       |

1. Excludes multiply or divide class instructions occurring in both issue slots.

2. Excludes divide/sqrt class instructions occurring in both issue slots

## 15.4 Instruction timing

Instruction timing in number of processor clock cycles for various instruction classes is shown in [Table 15-3](#). Pipelined instructions are shown with cycles of total latency and throughput cycles. Divide instructions are not pipelined and block other instructions from executing during execution.

Timing for EFPU instructions is detailed in [Table 15-6](#).

Timing for LSP instructions is detailed in:

- LSP simple instruction timing—[Table 15-7](#)
- LSP complex instruction timing—[Table 15-8](#)
- LSP shift/rotate instruction timing—[Table 15-9](#)
- LSP vector compare instruction timing—[Table 15-10](#)
- LSP vector select instruction timing—[Table 15-11](#)
- LSP vector data arrangement instruction timing—[Table 15-12](#)
- LSP multiply and multiply/accumulate instruction timing—[Table 15-13](#)
- LSP dot product instruction timing—[Table 15-14](#)
- LSP miscellaneous vector instruction timing—[Table 15-15](#)
- LSP load and store instruction timing—[Table 15-16](#)

Load/store multiple instruction cycles are represented as a fixed number of cycles plus a variable number of cycles where  $n$  is the number of words accessed by the instruction. In addition, cycle times marked with & require variable number of additional cycles due to serialization.

**Table 15-3. Instruction class cycle counts**

| Class of Instructions                                    | Latency         | Throughput      | Special notes                                                                                       |
|----------------------------------------------------------|-----------------|-----------------|-----------------------------------------------------------------------------------------------------|
| integer: <b>add, sub, shift, rotate, logical, cntlzw</b> | 1               | 1               | —                                                                                                   |
| integer: <b>compare</b>                                  | 1               | 1               | —                                                                                                   |
| Branch                                                   | 3/2/1           | 3/2/1           | Correct branch lookahead allows single-cycle execution. Worst-case mispredicted branch is 3 cycles. |
| multiply                                                 | 2               | 1               | —                                                                                                   |
| divide                                                   | 4–14            | 4–14            | Data-dependent timing                                                                               |
| CR logical                                               | 1               | 1               | —                                                                                                   |
| loads (non-multiple)                                     | 2               | 1               | —                                                                                                   |
| load multiple                                            | $2 + n/2$ (max) | $1 + n/2$ (max) | Actual timing depends on $n$ and address alignment.                                                 |
| stores (non-multiple)                                    | 2               | 1               | —                                                                                                   |

| e_xori[.]   | 1       | —             |

1. With early-out capability, timing is data-dependent.
2. Aligned.
3. Plus additional synchronization time.

Instruction timing for EFPU single-precision scalar floating-point instructions is shown in [Table 15-6](#). The table is sorted by opcode.

**Table 15-6. EFPU single-precision scalar floating-point instruction timing**

| Instruction | Latency | Throughput | Comments |
|-------------|---------|------------|----------|
| efsabs      | 2       | 1          | —        |
| efsadd      | 2       | 1          | —        |
| efscfh      | 2       | 1          | —        |

| efststlt    | 2       | 1              | —                                                    |

1. Destination register is also a source register, so for full throughput, back-to-back operations must use a different destination register.

Instruction timing in number of processor clock cycles for LSP instructions are shown in the following tables. Pipelined instructions are shown with cycles of total latency and throughput cycles. Divide instructions are not pipelined and block other instructions from executing during divide execution.

Instruction timing for LSP simple instructions is shown in [Table 15-7](#).

**Table 15-7. LSP simple instruction timing**

| Basic operation | Variants                                                         | Latency | Throughput |
|-----------------|------------------------------------------------------------------|---------|------------|
| Absolute value  | zvabsh, zabsw                                                    | 1       | 1          |
|                 | zvabshs, zabsws                                                  | 1       | 1          |
| Add             | zaddd, zvaddh, zvaddw                                            | 1       | 1          |
|                 | zadddss, zvaddhss, zaddwss, zvaddwss, zadddus, zvaddhus, zaddwus | 1       | 1          |
|                 | zvaddhx, zvaddhxss                                               | 1       | 1          |
|                 | zaddhe[s,u]w, zaddho[s,u]w                                       | 1       | 1          |
|                 | zvaddih                                                          | 1       | 1          |
|                 | zaddwgsf                                                         | 1       | 1          |

| Subf            | zsubfd, zvsubfh, zvsubfw                                                           | 1       | 1          |
|                 | zsubfdss, zvsubfhss, zsubfwss, zvsubfwss, zsubfdus, zvsubfhus, zsubfwus, zvsubfwus | 1       | 1          |
|                 | zvsubfhx, zvsubfhxss                                                               | 1       | 1          |
|                 | zsubfhe[s,u]w, zsubfho[s,u]w                                                       | 1       | 1          |
|                 | zvsubifh                                                                           | 1       | 1          |
|                 | zsubfwgsf                                                                          | 1       | 1          |
|                 | zsubfwgsi, zsubfwgui                                                               | 1       | 1          |
| SubfAdd         | zvsubfaddh, zvsubfaddhss, zvsubfaddw, zvsubfaddwss                                 | 1       | 1          |
|                 | zvsubfaddhx, zvsubfaddhxss                                                         | 1       | 1          |

Instruction timing for LSP complex instructions is shown in [Table 15-8](#). For the divide instruction, the number of stall cycles is (latency) for following instructions.

**Table 15-8. LSP complex instruction timing**

| Operation | Instruction | Latency | Throughput          |
|-----------|-------------|---------|---------------------|
| Divide    | zdivwsf     | 4 – 14  | 4 – 14 <sup>1</sup> |

1. Timing is data-dependent.

Instruction timing for LSP shift/rotate instructions is shown in [Table 15-9](#).

**Table 15-9. LSP shift/rotate instruction timing**

| Basic operation                  | Variants                           | Latency | Throughput |
|----------------------------------|------------------------------------|---------|------------|
| Logical Shift Left               | zvslh, zvslihi                     | 1       | 1          |
| Logical Shift Right              | zvsrhu, zvsrhiu                    | 1       | 1          |
| Rotate Left                      | zvrlih, zvrlihi                    | 1       | 1          |
| Signed Shift Left and Saturate   | zslwss, zslwiss, zvslhss, zvslhiss | 1       | 1          |
| Unsigned Shift Left and Saturate | zslwus, zslwius, zvslhus, zvslhius | 1       | 1          |

Instruction timing for LSP load and store instructions is shown in [Table 15-16](#).

**Table 15-16. LSP load and store instruction timing**

| Instruction          | Latency | Throughput |
|----------------------|---------|------------|
| all <b>zv</b> loads  | —       | 1          |
| all <b>zv</b> stores | —       | 1          |

## 15.5 Reservation instructions and cache interactions

If the CPU supports reservation instruction functionality, the CPU treats reservation instruction (**lbarx**, **lharx**, **lwarx**, **stbcx**, **sthcx**, and **stwcx**) accesses as though they were cache-inhibited, and forces a cache miss. A reservation access is always issued to the bus. This is done to allow external reservation logic to be built that properly signals a reservation failure. The bus access will be treated as a single-beat transfer.

## 15.6 Signal Processing Extension/Embedded Floating-point Status and Control Register (SPEFSCR)

Status and control for embedded floating-point operations use the SPEFSCR. This register is also used by the LSP APU. The SPEFSCR is implemented as special-purpose register (SPR) number 512 and is read and written by the `mfspr` and `mtspr` instructions. The SPEFSCR is shown in the following figure.

**Figure 15-6. LSP/EFPU Status and Control Register (SPEFSCR)**

The SPEFSCR bits are defined in the following table.

**Table 15-17. LSP/EFPU Status and Control Register field descriptions**

| Bits           | Name  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 15.7 Cache

This section describes the cache registers, cache control instructions, and various cache operations.

### 15.7.1 Cache overview

The e200z4251n3 processor supports an 8 KB 2-way set-associative instruction and 4KB 2-way set-associative data cache with a 32-byte line size. The caches improves system performance by providing low-latency data to the e200z4251n3 instruction and data pipelines, which decouples processor performance from system memory performance.

The e200z4251n3 processor also contains an 8-entry store buffer to decouple store completion to the processor from store completion on the data interface to further improve system performance.

Instruction and data addresses from the processor are used to index the cache arrays. If the access address matches a valid cache tag entry, the access hits in the cache.

## 15.7.2 L1 Cache Control and Status Register 0 (L1CSR0)

The L1 Cache Control and Status Register 0 (L1CSR0) is a 32-bit register used for general control of the data cache and for disabling ways in both caches. The L1CSR0 register is accessed using a **mfspr** or **mtspr** instruction. The L1CSR0 register is shown in the following figure.

**Figure 15-7. L1 Cache Control and Status Register 0 (L1CSR0)**

The L1CSR0 fields are described in the following table.

**Table 15-18. L1CSR0 field descriptions**

| Bits | Name | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 16    | DCEI  | Data Cache Error Injection<br><br>DCEI will cause injection of errors regardless of the setting of DCECE, although reporting of errors will be masked while DCECE = 0.<br><br>0 Cache Error Injection is disabled<br>1 A double-bit error will be injected on each write into the cache data array by inverting the two uppermost parity check bits (p_dchk[0:1]). This includes writes due to store hits as well as writes due to cache line refills.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 17:18 | DCLOC | Data Cache Lockout Control<br><br><b>Note:</b> For the <b>dcbi</b> and <b>dcbf</b> instructions, and for specialized load/store instructions, no lockout operation is performed, regardless of the occurrence of EDC/ECC error conditions, and errors are handled in the same manner as when lockout is disabled.<br><b>Note:</b> When operating in MC mode (DCEA = 00), detected errors on cache-inhibited accesses will not cause a data cache line to be locked out, instead the cache line contents are ignored.<br><br>00 Cache line lockout is disabled (and array LO indicators are ignored).<br><br>01 Cache line lockout is enabled. Cache lines with any tag errors or any data errors will have the corresponding lockout indicators set. A Machine check will not be generated for the error if the operation would have normally generated one unless a locked line is locked out.<br><br>10 Cache line lockout is enabled. Cache lines with any tag or data errors will have the corresponding lockout indicators set. A Machine check will still be generated for an error if the operation would have normally generated one.<br><br>11 Cache line lockout is enabled. Cache lines with uncorrectable tag errors or any data errors will have the corresponding lockout indicators set. A Machine check will not be generated for the error if the operation would have normally generated one unless a locked line is locked out. If a correctable tag error occurs, and is re-detected on recycling the access after a correction cycle for the tag is performed, the line is locked out regardless of detecting a single-bit or multi-bit error. |

**Table 15-18. L1CSR0 field descriptions (continued)**

| Bits | Name    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      |         | <p>00 Error Detection causes Machine Check exception.</p> <p>01 Error Detection causes Correction/Auto-invalidation. No machine check is generated for most cases. Correction is performed for single-bit tag errors, and lines with multi-bit tag errors are invalidated. Correction is performed for single or multi-bit data errors on cache hits by reloading of the line.</p> <p>10 Reserved</p> <p>11 Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                                            |
| 27   | DCLOINV | <p>Data Cache Lockout Indicator Invalidate</p> <p>When written to a 1 in conjunction with writing DCINV to a 1, a cache lockout indicator invalidation operation is initiated by hardware, and the LO bits are cleared, removing all line lockout status. Once complete, this bit is reset to 0. Writing a 1 while an invalidation operation is in progress will result in an undefined operation. Writing a 0 to this bit while an invalidation operation is in progress will be ignored. Cache lockout bit invalidation operations require approximately 66 cycles to complete. Invalidation occurs regardless of the data cache enable (DCE) value.</p> <p>When DCINV = 0: Reserved, do not set to 1</p> <p>When DCINV = 1:</p> <p>0 No cache lockout bit invalidate</p> <p>1 Cache lockout indicator invalidation operation</p> |
| 28   | —       | Reserved <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 29   | DCABT   | <p>Data Cache Operation Aborted</p> <p>Indicates a Cache Invalidate operation was aborted prior to completion. This bit is set by hardware on an aborted condition, and will remain set until cleared by software writing 0 to this bit location.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 30   | DCINV   | <p>Data Cache Invalidate</p> <p>When written to a 1, a cache invalidation operation is initiated by hardware. Once complete, this bit is reset to 0. Writing a 1 while an invalidation operation is in progress will result in an undefined operation. Writing a 0 to this bit while an invalidation operation is in progress will be ignored. Cache invalidation operations require approximately 66 cycles to complete. Invalidation occurs regardless of the data cache enable (DCE) value.</p> <p>0 No cache invalidate</p> <p>1 Cache invalidation operation</p>                                                                                                                                                                                                                                                               |
| 31   | DCE     | <p>Data Cache Enable</p> <p>When disabled, cache lookups are not performed for normal load or store accesses. Other L1CSR0 cache control operations are still available. Also, operation of the store buffer is not affected by DCE.</p> <p>0 Cache is disabled</p> <p>1 Cache is enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

1. These bits are not implemented and should be written with zero for future compatibility.

### 15.7.3 L1 Cache Control and Status Register 1 (L1CSR1)

The L1 Cache Control and Status Register 1 (L1CSR1) is a 32-bit register used for general control of the instruction cache. The L1CSR1 register is accessed using a **mf spr** or **mt spr** instruction. The L1CSR1 register is shown in the following figure.

**Figure 15-8. L1 Cache Control and Status Register 1 (L1CSR1)**

The L1CSR1 fields are described in the following table.

**Table 15-19. L1CSR1 field descriptions**

| Bits  | Name  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0:14  | —     | Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 15    | ICECE | Instruction Cache Error Checking Enable<br>0 Error Checking is disabled<br>1 Error Checking is enabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 16    | ICEI  | Instruction Cache Error Injection Enable<br>ICEI will cause injection of errors regardless of the setting of ICECE, although reporting of errors will be masked when ICECE = 0.<br>0 Cache Error Injection is disabled<br>1 A double-bit error will be injected into each doubleword written into the cache by inverting the two uppermost parity check bits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 17:18 | ICLOC | Instruction Cache Lockout Control<br><b>Note:</b> For the <b>icbi</b> instruction, no lockout operation is performed, regardless of the occurrence of EDC/ECC error conditions, and errors are handled in the same manner as when lockout is disabled. See ECC/EDC Error Handling for Cache Control Operations and Instructions.<br><b>Note:</b> When operating in MC mode (ICEA = 00), detected errors on cache-inhibited accesses will not cause an instruction cache line to be locked out, instead the cache line contents are ignored.<br>00 Cache line lockout is disabled (and array LO indicators are ignored).<br>01 Cache line lockout is enabled. Cache lines with any tag errors or any data errors will have the corresponding lockout indicators set. A Machine check will not be generated for the error if the operation would have normally generated one unless a locked line is locked out. |

**Table 15-19. L1CSR1 field descriptions (continued)**

| Bits  | Name    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       |         | <p>10 Cache line lockout is enabled. Cache lines with any tag or data errors will have the corresponding lockout indicators set. A Machine check will still be generated for an error if the operation would have normally generated one.</p> <p>11 Cache line lockout is enabled. Cache lines with uncorrectable tag errors or any data errors will have the corresponding lockout indicators set. A Machine check will not be generated for the error if the operation would have normally generated one unless a locked line is locked out. If a correctable tag error occurs, and is re-detected on recycling the access after a correction cycle for the tag is performed, the line is locked out regardless of detecting a single-bit or multi-bit error.</p>                                                                               |
| 19:24 | —       | Reserved <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 25:26 | ICEA    | <p>Instruction Cache Error Action</p> <p>00 Error Detection causes Machine Check exception.</p> <p>01 Error Detection causes Correction/Auto-invalidation. No machine check is generated for most cases. Correction is performed for single-bit tag errors, and lines with multi-bit tag errors are invalidated. Correction is performed for single or multi-bit data errors on cache hits by reloading of the line.</p> <p>10 Reserved</p> <p>11 Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                    |
| 27    | ICLOINV | <p>Instruction Cache Lockout Indicator Invalidate</p> <p>When written to a 1 in conjunction with writing ICINV to a 1, a cache lockout indicator invalidation operation is initiated by hardware, and the LO bits are cleared, removing all line lockout status. Once complete, this bit is reset to 0. Writing a 1 while an invalidation operation is in progress will result in an undefined operation. Writing a 0 to this bit while an invalidation operation is in progress will be ignored. Cache lockout bit invalidation operations require approximately 66 cycles to complete. Invalidation occurs regardless of the instruction cache enable (ICE) value.</p> <p>When ICINV = 0: Reserved, do not set to 1</p> <p>When ICINV = 1:</p> <p>0 No cache lockout bit invalidate</p> <p>1 Cache lockout indicator invalidation operation</p> |
| 28    | —       | Reserved <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 29    | ICABT   | <p>Instruction Cache Operation Aborted</p> <p>Indicates a Cache Invalidate operation was aborted prior to completion. This bit is set by hardware on an aborted condition, and will remain set until cleared by software writing 0 to this bit location.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 30    | ICINV   | <p>Instruction Cache Invalidate</p> <p>When written to a 1, a cache invalidation operation is initiated by hardware. Once complete, this bit is reset to 0. Writing a 1 while an invalidation operation is in progress will result in an undefined operation. Writing a 0 to this bit while an invalidation operation is in progress will be ignored. Cache invalidation operations require approximately 130 cycles to complete. Invalidation occurs regardless of the enable (ICE) value.</p> <p>0 No cache invalidate</p>                                                                                                                                                                                                                                                                                                                      |

1. These bits are not implemented and should be written with zero for future compatibility.

### 15.7.4 L1 Cache Configuration Register 0 (L1CFG0)

The L1 Cache Configuration Register 0 (L1CFG0) is a 32-bit read-only register. L1CFG0 provides information about the configuration of the e200z4251n3 L1 data cache design. The contents of the L1CFG0 register can be read using a **mfsspr** instruction. The L1CFG0 register is shown in the following figure.

| CARCH | CWPA | CFAHA | DCFISWA | 0 | DCBSIZE | DCREPL | DCLA | DCECA | DCNWAY |    |    |    |    |    |    |    |    |    |    |    | DCSIZE |    |    |    |    |    |    |    |    |    |    |  |

| 21:31 | ICSIZE | Instruction Cache Size<br>0x008 The size of the instruction cache is 8 KB                                  |

### 15.7.6 Data Cache Software Coherency

Data cache coherency is supported through software operations to invalidate lines using either a **dcbi** or **dcbf** instruction, or by using the L1FINV0 control register.

Data cache misses will force the store buffer to empty prior to performing the access.

### 15.7.7 Data Cache Hardware Coherency

Data cache coherency is not supported in hardware. Software operations must generally be used to maintain coherency. Debug support is provided, however, for a D-Cache line invalidation operation requested by an external hardware debugger. When requested by an external hardware debugger tool operating through the OnCE port, an individual cache line invalidation operation will be scheduled to occur at the next available D-Cache access cycle.

### 15.7.8 Cache Invalidate by Set and Way

e200z4251n3 supports cache set/way invalidation under software control. The caches may be invalidated by index and way through a **mtspr l1finv{0,1}** instruction.

The L1 Flush and Invalidate Control Registers (L1FINV{0,1}) are 32-bit SPRs used to select a cache set and way to be invalidated. This function is available even when a cache is disabled. L1FINV0 is used for data cache operations, while L1FINV1 is used for instruction cache operations.

### 15.7.8.1 L1FINV0

The SPR number for L1FINV0 is 1016 in decimal. The L1FINV0 register is shown in the following figure.

**Figure 15-11. L1 Flush/Invalidate Register 0 (L1FINV0)**

The L1FINV0 bits are described in the following table.

**Table 15-22. L1FINV0 field descriptions**

| Bits   | Name | Description                                                                                                                                                                                                                                |
|--------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0:6    | —    | Reserved for way extension                                                                                                                                                                                                                 |
| 7      | CWAY | Cache Way<br>Specifies the data cache way to be selected                                                                                                                                                                                   |
| 8: 20  | —    | Reserved <sup>1</sup> for set extension                                                                                                                                                                                                    |
| 21 :26 | CSET | Cache Set<br>Specifies the cache set to be selected                                                                                                                                                                                        |
| 27:28  | —    | Reserved <sup>1</sup> for set/command extension                                                                                                                                                                                            |
| 29:31  | CCMD | Cache Command<br>000 = The data contained in this entry is invalidated. LO bits are unaffected<br>001 Reserved<br>01x Reserved<br>100 Reserved<br>101 The data contained in this entry is invalidated. LO bits are cleared<br>11x Reserved |

1. These bits are not implemented and should be written with zero for future compatibility.

For invalidation operations via L1FINV0, tag ECC errors and data EDC errors are ignored, and the selected line will be invalidated regardless of any error. Invalidations conditionally affect the state of the lockout bits (LO).

### 15.7.8.2 L1FINV1

The L1FINV1 register is shown in following figure.

**Figure 15-12. L1 Flush/Invalidate Register 1 (L1FINV1)**

The L1FINV1 bits are described in the following table.

**Table 15-23. L1FINV1 field descriptions**

| Bits   | Name | Description                                                                                                                                                                                                                              |
|--------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0:6    | —    | Reserved for way extension                                                                                                                                                                                                               |
| 7      | CWAY | Cache Way<br>Specifies the instruction cache way to be selected                                                                                                                                                                          |
| 8: 19  | —    | Reserved <sup>1</sup> for set extension                                                                                                                                                                                                  |
| 20 :26 | CSET | Cache Set<br>Specifies the instruction cache set to be selected                                                                                                                                                                          |
| 27:28  | —    | Reserved <sup>1</sup> for set/command extension                                                                                                                                                                                          |
| 29:31  | CCMD | Cache Command<br>000 The data contained in this entry is invalidated. LO bits are unaffected<br>001 Reserved<br>01x Reserved<br>100 Reserved<br>101 The data contained in this entry is invalidated. LO bits are cleared<br>11x Reserved |

1. These bits are not implemented and should be written with zero for future compatibility.

For invalidation operations via L1FINV1, tag ECC errors and data EDC errors are ignored, and the selected line will be invalidated regardless of any error. Invalidations conditionally affect the state of the lockout bits (LO).

### 15.7.9 Cache EDC/ECC Parity Protection

Cache parity protection is supported for both the tag and data arrays of each cache. Seven parity check bits are provided for each tag entry for the tag arrays of both caches to support error detection and correction (ECC - SECDED). Eight parity check bits are

provided for each doubleword in the data arrays of the I-Cache, and each word in the data arrays of the D-Cache, which are used for single- and double-bit error detection (EDC - DED, double error detection). Utilizing ECC/EDC protection, many multi-bit errors are also detected.

The error detection codes also cover the cache index address of the cache line, providing additional protection against addressing errors. If any type of error (including a single-bit error in one of the index bits) is encountered in one of the index address bits, it is treated as an uncorrectable tag ECC error to protect against internal addressing failures. No attempt will be made to correct single-bit errors where the syndrome indicates an index address bit.

Tag ECC and data EDC checking is controlled by the L1CSR0[DCECE] and L1CSR1[ICECE] control fields. When error checking is enabled, checking is performed on each cache access. Errors are not signaled by the respective cache when cache error checking is disabled for that cache ( $L1CSR\{0,1\}_{[D,I]CECE} = 0$ ).

If an uncorrectable tag ECC error is detected on any portion of a tag accessed during cache lookups performed because of instruction fetching, normal loads, or normal stores a tag ECC error is signaled, regardless of whether a cache hit or miss occurs. Otherwise, if a cache hit for an instruction fetch or a normal load occurs and a data EDC error is detected on any portion of the accessed data, a parity error is also signaled.

Store hits to the D-Cache will be placed into one of the RMW buffers to support EDC checkbit operation. If the store is a partial-width store, the cache data word corresponding to the address of the store is read into the next available buffer, the store data is merged, and the new EDC checkbits for the word are calculated. If the store is a full-width store, no read of the cache data is performed, since the store will overwrite the full EDC data granularity, and the EDC checkbits can be computed directly. Buffers are managed on a FIFO basis. If no buffer is available to hold the store data, a stall is incurred while a buffer (or two if possible) is written back to the cache to be freed for holding the new store. Buffers are written back to the D-Cache during otherwise idle cycles when two buffers are occupied, providing a simple form of store gathering.

Signaling of an ECC error or EDC error may cause a Machine Check exception to occur. One or more syndrome bits may be set in the Machine Check Syndrome register, or may instead result in a correction/auto-invalidation operation and not result in an exception being signaled. Both may occur, depending on the error action control setting in the appropriate cache control register.

### 15.7.9.1 Cache Line Lockout

In addition to the ECC/EDC protection employed for the caches, each cache line in the I-Cache and D-Cache has a lockout indicator composed of a redundant set of lockout bits. These lockout bits can selectively be set when certain errors occur in either the tag or the data portion of the cache line. Use of the lockout function and control over error conditions that cause a lockout to occur are controlled by  $L1CSR\{0,1\}_{[D,I]CLOC}$ . When the lockout function is enabled, lines that encounter selected tag ECC or data EDC errors on normal instruction fetch, load, or store accesses will have their lockout bits set. When the lockout indicator is set, the line will not be replaced and will remain in an invalid state, effectively disabling it. Also, future tag ECC or data EDC errors on the line are ignored. Cache-inhibited accesses will only set lockout indicators on lines not in a locked way. In addition, no lockout indicators are set by cache-inhibited accesses when operating in machine check mode.

When operating in machine check mode, if lockout controls are enabled via  $L1CSR\{0,1\}_{[D,I]CLOC}$ , lockout bit parity errors on any line detected on a cacheable cache lookup will generate a machine check exception.

If correction/auto-invalidation is instead enabled, on each cache lookup operation for an instruction fetch or normal load or store access, if a single- or double-bit lockout bit parity error is detected in one or more ways and lockout controls are enabled, the lockout error(s) will be corrected by rewriting all lockout bits to the asserted state, and no machine check is generated, unless the line is in a locked way. If a line in a locked way incurs a LO bit parity error, a machine check will be generated to ensure that any possible new lockout of the line is reported. For non-cacheable accesses, lockout bit parity errors will only be corrected for lines not in a locked way. Lockout bit parity errors do not generate a machine check for non-cacheable accesses in either error action mode, thus lockout bit correction is not performed for lockout bit parity errors detected on a line in a locked way.

In addition, to avoid certain exception conditions and for consistency with error reporting, specialized load/store accesses do not set LO bits; instead, cache contents are ignored for lines with those errors. Cache flush and invalidate instructions do not report or correct lockout bit parity errors. For both of these cases, a future cacheable normal access will perform the lockout function if required.

## 15.7.10 Cache Error Injection

Cache error injection provides a way to test error recovery by intentionally injecting parity errors into the instruction and/or data cache.

Error injection into the instruction cache operates as follows:

- If  $L1CSR1_{ICEI}$  is set, any instruction cache line fill to the instruction cache data has the associated two most significant parity check bits inverted in the instruction cache data array for each doubleword loaded.

Error injection for the data cache operates as follows:

- If  $L1CSR0_{DCEI}$  is set, any cache line fill to the data cache data array has the associated two most significant parity check bits inverted in the data array for each word loaded. Additionally, inverted parity bits are generated for any data stored into the data cache data array on a store hit.

Cache parity error injection is not performed for cache debug write accesses, since parity bit values written can be directly controlled.

In order to clear the parity errors, a cache invalidation or an invalidation of the lines that could have had an injected parity error may be performed. Line invalidation may be performed by an **icbi/dcbi** instruction or an  $L1FINV\{0,1\}$  invalidation operation.

## 15.8 Exceptions

Interrupts implemented in e200z4251n3 and the exception conditions that cause them are listed in the following table.

**Table 15-24. Exceptions and Conditions**

| Interrupt type      | Interrupt vector offset value                        | Causing conditions                                                                                                                                                                                                                                                                                                                                                        |

1. Autovectorized External Input interrupts use this offset value. Vectored interrupts supply an interrupt vector offset directly.

### 15.8.1 Exception Syndrome Register (ESR)

The Exception Syndrome Register (ESR) provides a *syndrome* to differentiate between exceptions that can generate the same interrupt type.

### Figure 15-13. Exception Syndrome Register (ESR)

The ESR bits are defined in the following table.

### Table 15-25. ESR field descriptions

| Bit(s) | Name | Description                                                                                                    | Associated interrupt type |

## 15.8.2 Machine State Register (MSR)

The Machine State Register defines the state of the processor. The e200z4251n3 MSR is shown in the following figure.

**Figure 15-14. Machine State Register (MSR)**

The MSR bits are defined in the following table.

**Table 15-26. MSR field descriptions**

| Bit(s) | Name | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### 15.8.3 Machine Check Syndrome Register (MCSR)

When the processor takes a machine check interrupt, it updates the Machine Check Syndrome Register (MCSR) to differentiate between machine check conditions. The MCSR is shown in the following figure.

|     |          |   |          |          |          |          |          |          |   |     |     |     |    |    |    |    |    |    |           |           |             |             |    |           |           |           |           |    |    |    |    |

**Figure 15-15. Machine Check Syndrome Register (MCSR)**

The following table describes MCSR fields. The MCSR indicates the source of a machine check condition.

All bits in the MCSR are implemented as "write 1 to clear." Software in the machine check handler is expected to clear the MCSR bits it has sampled prior to re-enabling MSR<sub>ME</sub> to avoid a redundant machine check exception and to prepare for updated status bit information on the next machine check interrupt.

Note that any set bit in the MCSR other than status-type bits will cause a subsequent machine check interrupt once MSR<sub>ME</sub> = 1.

**Table 15-27. Machine Check Syndrome Register (MCSR) field descriptions**

| Bit  | Name     | Description                                                                                                                                                                                                                         | Exception type <sup>1</sup> | Recoverable |

| 30    | BUS_WRDSI | Write bus error on buffered store to bus with DSI signaled. Set concurrently with BUS_WRERR for this case | Async Mchk                  | Unlikely             |
| 31    | —         | Reserved                                                                                                  | —                           | —                    |

1. The Exception Type indicates the exception type associated with a given syndrome bit.

- "Error Report" indicates that this bit is only set for error report exceptions which cause machine check interrupts. These bits are only updated when the machine check interrupt is actually taken. Error report exceptions are not gated by MSR<sub>ME</sub>. These are synchronous exceptions. These bits will remain set until cleared by software writing a '1' to the bit position(s) to be cleared.
- "Status" indicates that this bit provides additional status information regarding the logging of a machine check exception. These bits will remain set until cleared by software writing a '1' to the bit position(s) to be cleared.
- "NMI" indicates that this bit is only set for the non-maskable interrupt type exception which causes a machine check interrupt. This bit is only updated when the machine check interrupt is actually taken. NMI exceptions are not gated by MSR<sub>ME</sub>. This is an asynchronous exception. This bit will remain set until cleared by software writing a '1' to the bit position.
- "Async Mchk" indicates that this bit is set for an asynchronous machine check exception. These bits are set immediately upon detection of the error. Once any "Async Mchk" bit is set in the MCSR, a machine check interrupt will occur if MSR<sub>ME</sub> = 1. If MSR<sub>ME</sub> = 0, the machine check exception will remain pending. These bits will remain set until cleared by software writing a '1' to the bit position(s) to be cleared.

2. Note that since no address translation mechanism is present on e200z4251n3, the MEA value is always set to '0'.

3. Will not be set by e200z4251n3 since no local instruction memory is present.

## 15.8.4 Interrupt Vector Prefix Registers (IVPR)

The Interrupt Vector Prefix Register is used during interrupt processing for determining the starting address of a software handler used to handle an interrupt. The value of the Vector Offset selected for a particular interrupt type is concatenated with the Vector Base value held in the IVPR to form an instruction address from which execution is to begin. The format of IVPR is shown in the following figure.

**Figure 15-16. Interrupt Vector Prefix Register (IVPR)**

The IVPR fields are defined in the following table.

**Table 15-28. IVPR field descriptions**

| Bit(s)           | Name        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0:23<br>(32:55)  | Vector Base | Vector Base<br>This field is used to define the base location of the vector table, aligned to a 256-byte boundary. This field provides the high-order 24 bits of the location of all interrupt handlers (unless hardware vectoring is used). The vector offset value appropriate for the type of exception being processed is concatenated with the IVPR Vector Base to form the address of the handler in memory. For hardware-vectored interrupts, the value of the supplied interrupt vector is logically OR'ed with the low order bits of the Vec Base Field to determine the interrupt handler address. |
| 24:31<br>(56:63) | —           | Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 15.8.5 Interrupt Definitions

### 15.8.5.1 Critical Input Interrupt (offset 0x00)

A Critical Input exception is signaled to the processor by the assertion of the critical interrupt pin. If the exception is enabled by  $MSR_{CE}$ , the Critical Input interrupt is taken.

A Critical Input interrupt may be delayed by other higher priority exceptions or if  $MSR_{CE}$  is cleared when the exception occurs.

The following table lists register settings when a Critical Input interrupt is taken.

**Table 15-29. Critical Input Interrupt—register settings**

| Register | Setting description                                                                                                                              |   |     |                  |     |   |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------|---|-----|------------------|-----|---|
| CSRR0    | Set to the effective address of the instruction that the processor would have attempted to execute next if no exception conditions were present. |   |     |                  |     |   |
| CSRR1    | Set to the contents of the MSR at the time of the interrupt                                                                                      |   |     |                  |     |   |
| MSR      | SPV                                                                                                                                              | 0 | FP  | 0                | FE1 | 0 |
|          | WE                                                                                                                                               | 0 | ME  | —                | IS  | 0 |
|          | CE                                                                                                                                               | 0 | FE0 | 0                | DS  | 0 |
|          | EE                                                                                                                                               | 0 | DE  | —/0 <sup>1</sup> | PMM | 0 |
|          | PR                                                                                                                                               | 0 |     |                  | RI  | — |
| ESR      | Unchanged                                                                                                                                        |   |     |                  |     |   |
| MCSR     | Unchanged                                                                                                                                        |   |     |                  |     |   |
| DEAR     | Unchanged                                                                                                                                        |   |     |                  |     |   |
| Vector   | IVPR <sub>0:23</sub>    0x00 (autovectored)                                                                                                      |   |     |                  |     |   |
|          | IVPR <sub>0:15</sub>    (IVPR <sub>16:29</sub>   p_voffset[0:13])    2'b00 (non-autovectored)                                                    |   |     |                  |     |   |

## Exceptions

1. Clearing of DE is optionally supported by control in HID0.

The MSR<sub>DE</sub> bit is not automatically cleared by a Critical Input interrupt, but it can be configured to be cleared via the HID0 register (HID0<sub>CICLRDE</sub>).

### 15.8.5.2 Machine Check Interrupt (offset 0x10)

The EIS Machine Check APU defines a separate set of save/restore registers (MCSRR0/1), a Machine Check Syndrome Register (MCSR) to record the source(s) of machine checks, and a Machine Check Address Register (MCAR) to hold an address associated with a machine check for certain classes of machine checks. Return from Machine Check instructions (**se\_rfmci**) are also provided to support returns using MCSRR0/1.

The MSR<sub>DE</sub> bit is not automatically cleared by a Machine Check exception, but it can be configured to be cleared or left unchanged via the HID0 register (HID0<sub>MCCLRDE</sub>).

When a Machine Check interrupt is taken, registers are updated as shown in the following table.

**Table 15-30. Machine Check Interrupt—register settings**

| Register | Setting description                                                                                                                                   |   |     |                  |     |   |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------|---|-----|------------------|-----|---|
| MCSRR0   | On a best-effort basis, set to the address of some instruction that was executing or about to be executing when the machine check condition occurred. |   |     |                  |     |   |
| MCSRR1   | Set to the contents of the MSR at the time of the interrupt                                                                                           |   |     |                  |     |   |
| MSR      | SPV                                                                                                                                                   | 0 | FP  | 0                | FE1 | 0 |
|          | WE                                                                                                                                                    | 0 | ME  | 0                | IS  | 0 |

|          | PR                                                                                                                                                    | 0 |     |                  | RI  | 0 |
| ESR      | Unchanged                                                                                                                                             |   |     |                  |     |   |
| MCSR     | Updated to reflect the source(s) of a machine check. Hardware only sets appropriate bits, no previously set bits are cleared by hardware.             |   |     |                  |     |   |
| Vector   | IVPR <sub>0:23</sub>    0x10                                                                                                                          |   |     |                  |     |   |

1. Clearing of DE is optionally supported by control in HID0.

### 15.8.5.3 Data Storage Interrupt (offset 0x20)

A Data Storage interrupt (DSI) may occur if no higher priority exception exists and a Read or Write Access Control exception condition exists.

The following table lists register settings when a DSI is taken.

**Table 15-31. Data Storage Interrupt—register settings**

| Register | Setting description                                                                                  |   |                                             |   |     |   |
|----------|------------------------------------------------------------------------------------------------------|---|---------------------------------------------|---|-----|---|
| SRR0     | Set to the effective address of the excepting load/store instruction.                                |   |                                             |   |     |   |
| SRR1     | Set to the contents of the MSR at the time of the interrupt                                          |   |                                             |   |     |   |
| MSR      | SPV                                                                                                  | 0 | FP                                          | 0 | FE1 | 0 |
|          | WE                                                                                                   | 0 | ME                                          | — | IS  | 0 |
|          | CE                                                                                                   | — | FE0                                         | 0 | DS  | 0 |
|          | EE                                                                                                   | 0 | DE                                          | — | PMM | 0 |
|          | PR                                                                                                   | 0 |                                             |   | RI  | — |
| ESR      | Access:                                                                                              |   | [ST], [SPV], VLEMI. All other bits cleared. |   |     |   |
| MCSR     | Unchanged                                                                                            |   |                                             |   |     |   |
| DEAR     | For Access Control exceptions, set to the effective address of the access that caused the violation. |   |                                             |   |     |   |
| Vector   | IVPR <sub>0:23</sub>    0x20                                                                         |   |                                             |   |     |   |

### 15.8.5.4 Instruction Storage Interrupt (offset 0x30)

An Instruction Storage interrupt (ISI) occurs when no higher priority exception exists and an Execute Access Control exception occurs.

The following table lists register settings when an ISI is taken.

**Table 15-32. Instruction Storage Interrupt—register settings**

| Register | Setting description                                         |   |     |   |     |   |
|----------|-------------------------------------------------------------|---|-----|---|-----|---|
| SRR0     | Set to the effective address of the excepting instruction.  |   |     |   |     |   |
| SRR1     | Set to the contents of the MSR at the time of the interrupt |   |     |   |     |   |
| MSR      | SPV                                                         | 0 | FP  | 0 | FE1 | 0 |
|          | WE                                                          | 0 | ME  | — | IS  | 0 |
|          | CE                                                          | — | FE0 | 0 | DS  | 0 |
|          | EE                                                          | 0 | DE  | — | PMM | 0 |
|          | PR                                                          | 0 |     |   | RI  | — |
| ESR      | VLEMI. All other bits cleared.                              |   |     |   |     |   |
| MCSR     | Unchanged                                                   |   |     |   |     |   |
| DEAR     | Unchanged                                                   |   |     |   |     |   |
| Vector   | IVPR <sub>0:23</sub>    0x30                                |   |     |   |     |   |

### 15.8.5.5 External Input Interrupt (offset 0x40)

An External Input exception is signaled to the processor by the assertion of an interrupt from the interrupt controller. The input is a level-sensitive signal expected to remain asserted until the core acknowledges the external interrupt. If the input is negated early, recognition of the interrupt request is not guaranteed. When the core detects the exception, if the exception is enabled by  $MSR_{EE}$ , it takes the External Input interrupt.

An External Input interrupt may be delayed by other higher priority exceptions or if  $MSR_{EE}$  is cleared when the exception occurs.

The following table lists register settings when an External Input interrupt is taken.

**Table 15-33. External Input Interrupt—Register Settings**

| Register | Setting description                                                                                                                              |   |     |   |     |   |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------|---|-----|---|-----|---|
| SRR0     | Set to the effective address of the instruction that the processor would have attempted to execute next if no exception conditions were present. |   |     |   |     |   |
| SRR1     | Set to the contents of the MSR at the time of the interrupt                                                                                      |   |     |   |     |   |
| MSR      | SPV                                                                                                                                              | 0 | FP  | 0 | FE1 | 0 |

### 15.8.5.6 Alignment Interrupt (offset 0x50)

An Alignment exception is generated when any of the following occurs:

- The operand of **lmw** or **stmw** is not word aligned.
- The operand of **lwarx** or **stwcx.** is not word aligned.
- The operand of **lharx** or **sthcx.** is not halfword aligned.
- Execution of a **dcbz** instruction is attempted.
- Execution of an LSP APU load or store instruction that is not properly aligned.

The following table lists register settings when an alignment interrupt is taken.

**Table 15-34. Alignment Interrupt—register settings**

| Register | Setting description                                                                       |   |     |   |     |   |
|----------|-------------------------------------------------------------------------------------------|---|-----|---|-----|---|
| SRR0     | Set to the effective address of the excepting load/store/dcbz instruction.                |   |     |   |     |   |
| SRR1     | Set to the contents of the MSR at the time of the interrupt                               |   |     |   |     |   |
| MSR      | SPV                                                                                       | 0 | FP  | 0 | FE1 | 0 |

|          | EE                                                                                        | 0 | DE  | — | PMM | 0 |
|          | PR                                                                                        | 0 |     |   | RI  | — |
| ESR      | [ST], [SPV], VLEMI. All other bits cleared.                                               |   |     |   |     |   |
| MCSR     | Unchanged                                                                                 |   |     |   |     |   |
| DEAR     | Set to the effective address of a byte of the load or store access causing the violation. |   |     |   |     |   |
| Vector   | IVPR <sub>0:23</sub>    0x50                                                              |   |     |   |     |   |

### 15.8.5.7 Program Interrupt (offset 0x60)

A program interrupt occurs when no higher priority exception exists and one or more of the following exception conditions occur:

- Illegal Instruction exception
- Privileged Instruction exception
- Trap exception

The e200z4251n3 will invoke an Illegal Instruction program exception on attempted execution of the following instructions:

- Unimplemented instructions
- An instruction from the illegal instruction class
- **mtspr** and **mfspir** instructions with an undefined SPR specified
- **mtdcr** and **mfddcr** instructions with an undefined DCR specified

The e200z4251n3 will invoke a Privileged Instruction program exception on attempted execution of the following instructions when MSR<sub>PR</sub> = 1 (user mode):

- A privileged instruction
- **mtspr** and **mfspir** instructions that specify a SPRN value with SPRN<sub>5</sub> = 1 (even if the SPR is undefined)

## Exceptions

The e200z4251n3 will invoke a Trap exception on execution of the **tw** instruction if the trap conditions are met and the exception is not also enabled as a Debug interrupt.

The core will invoke an Illegal instruction program exception on attempted execution of the instructions **lswi**, **lswx**, **stswi**, **stswx**, **mfapidi**, **mfdcrx**, **mtdcrx**, or on any *Power ISA 2.06* floating-point instruction. All other defined or allocated instructions that are not implemented by core will cause an illegal instruction program exception.

The following table lists register settings when a Program interrupt is taken.

**Table 15-35. Program Interrupt—register settings**

| Register | Setting description                                         |   |                                     |   |     |   |
|----------|-------------------------------------------------------------|---|-------------------------------------|---|-----|---|
| SRR0     | Set to the effective address of the excepting instruction.  |   |                                     |   |     |   |
| SRR1     | Set to the contents of the MSR at the time of the interrupt |   |                                     |   |     |   |
| MSR      | SPV                                                         | 0 | FP                                  | 0 | FE1 | 0 |

| Vector   | IVPR <sub>0:23</sub>    0x60                                |   |                                     |   |     |   |

### 15.8.5.8 Performance Monitor Interrupt (offset 0x70)

A performance monitor interrupt that may be generated by an enabled condition or event. An enabled condition or event is as follows:

A PMC<sub>x</sub> register overflow condition occurs with the following settings:

- PMLC<sub>x</sub>CE = 11; that is, for the given counter the overflow condition is enabled.
- PMC<sub>x</sub>OV = 11; that is, the given counter indicates an overflow.

For a performance monitor interrupt to be signaled on an enabled condition or event, PMGC<sub>0</sub>PMIE must be set.

Although an exception condition may occur with MSR<sub>EE</sub> = 0, the interrupt cannot be taken until MSR<sub>EE</sub> = 1.

The priority of the performance monitor interrupt is below all other asynchronous interrupts.

The following table lists register settings when an performance monitor interrupt is taken.

**Table 15-36. Performance Monitor Interrupt—Register Settings**

| Register                    | Setting description                                                  |                  |     |                  |     |   |
|-----------------------------|----------------------------------------------------------------------|------------------|-----|------------------|-----|---|
| SRR0/<br>DSRR0              | Set to the effective address of the next instruction to be executed. |                  |     |                  |     |   |
| SRR1/<br>DSRR1 <sup>1</sup> | Set to the contents of the MSR at the time of the interrupt.         |                  |     |                  |     |   |
| MSR                         | SPV                                                                  | 0                | FP  | 0                | FE1 | 0 |

| DEAR                        | Unchanged                                                            |                  |     |                  |     |   |
| Vector                      | IVPR <sub>0:23</sub>    0x70                                         |                  |     |                  |     |   |

1. DSRR0/1 are used if PMGC0<sub>UDI</sub> = 1
2. CE is cleared if PMGC0<sub>UDI</sub> = 1 and HID0<sub>DCLRC</sub> = 1
3. EE is not cleared if PMGC0<sub>UDI</sub> = 1 and HID0<sub>DCLREE</sub> = 0
4. DE is cleared if PMGC0<sub>UDI</sub> = 1

### 15.8.5.9 System Call Interrupt (offset 0x80)

A System Call interrupt occurs when a System Call (`se_sc`) instruction is executed and no higher priority exception exists.

The following table lists register settings when a System Call interrupt is taken.

**Table 15-37. System Call Interrupt—register settings**

| Register | Setting description                                                                           |   |     |   |     |   |
|----------|-----------------------------------------------------------------------------------------------|---|-----|---|-----|---|
| SRR0     | Set to the effective address of the instruction <i>following</i> the system call instruction. |   |     |   |     |   |
| SRR1     | Set to the contents of the MSR at the time of the interrupt                                   |   |     |   |     |   |
| MSR      | SPV                                                                                           | 0 | FP  | 0 | FE1 | 0 |
|          | WE                                                                                            | 0 | ME  | — | IS  | 0 |
|          | CE                                                                                            | — | FE0 | 0 | DS  | 0 |
|          | EE                                                                                            | 0 | DE  | — | PMM | 0 |
|          | PR                                                                                            | 0 |     |   | RI  | — |

*Table continues on the next page...*

**Table 15-37. System Call Interrupt—register settings (continued)**

| Register | Setting description            |
|----------|--------------------------------|
| ESR      | VLEMI. All other bits cleared. |
| MCSR     | Unchanged                      |
| DEAR     | Unchanged                      |

### 15.8.5.10 Debug Interrupt (offset 0x90)

There are multiple sources that can signal a Debug exception. A Debug interrupt occurs when no higher priority exception exists, a Debug exception exists in the Debug Status Register, and Debug interrupts are enabled (both DBCR0<sub>IDM</sub> = 1 (internal debug mode) and MSR<sub>DE</sub> = 1).

The following table lists register settings when a Debug interrupt is taken.

**Table 15-38. Debug Interrupt—register settings**

| Register                     | Setting description                                                                                                                                                                                                                                                                                                                                                                                                                                  |                  |              |   |     |   |

| Vector   | IVPR <sub>0:23</sub>    0x90                  |                |

1. Assumes that the Debug interrupt is precise
2. Conditional based on control bits in HID0
3. Note that multiple DBSR bits may be set

### 15.8.5.11 Embedded Floating-point Data Interrupt (offset 0xA0)

The Embedded Floating-point Data interrupt is taken if no higher priority exception exists and an EFPU Floating-point Data exception is generated. When a Floating-point Data exception occurs, the processor suppresses execution of the instruction causing the exception.

The following table lists register settings when an EFPU Floating-point Data interrupt is taken.

**Table 15-39. Embedded Floating-point Data Interrupt—register settings**

| Register | Setting description                                             |   |     |   |     |   |
|----------|-----------------------------------------------------------------|---|-----|---|-----|---|
| SRR0     | Set to the effective address of the excepting EFPU instruction. |   |     |   |     |   |
| SRR1     | Set to the contents of the MSR at the time of the interrupt     |   |     |   |     |   |
| MSR      | SPV                                                             | 0 | FP  | 0 | FE1 | 0 |
|          | WE                                                              | 0 | ME  | — | IS  | 0 |
|          | CE                                                              | — | FE0 | 0 | DS  | 0 |
|          | EE                                                              | 0 | DE  | — | PMM | 0 |
|          | PR                                                              | 0 |     |   | RI  | — |
| ESR      | SPV, VLEMI. All other bits cleared.                             |   |     |   |     |   |
| MCSR     | Unchanged                                                       |   |     |   |     |   |
| DEAR     | Unchanged                                                       |   |     |   |     |   |
| Vector   | IVPR <sub>0:23</sub>    0xA0                                    |   |     |   |     |   |

### 15.8.5.12 Embedded Floating-point Round Interrupt (offset 0xB0)

The Embedded Floating-point Round interrupt is taken when an EFPU floating-point instruction generates an inexact result and inexact exceptions are enabled.

The following table lists register settings when an EFPU Floating-point Round interrupt is taken.

**Table 15-40. Embedded Floating-point Round Interrupt—register settings**

| Register | Setting description                                                                       |   |     |   |     |   |
|----------|-------------------------------------------------------------------------------------------|---|-----|---|-----|---|
| SRR0     | Set to the effective address of the instruction following the excepting EFPU instruction. |   |     |   |     |   |
| SRR1     | Set to the contents of the MSR at the time of the interrupt                               |   |     |   |     |   |
| MSR      | SPV                                                                                       | 0 | FP  | 0 | FE1 | 0 |
|          | WE                                                                                        | 0 | ME  | — | IS  | 0 |
|          | CE                                                                                        | — | FE0 | 0 | DS  | 0 |
|          | EE                                                                                        | 0 | DE  | — | PMM | 0 |
|          | PR                                                                                        | 0 |     |   | RI  | — |
| ESR      | SPV, VLEMI. All other bits cleared.                                                       |   |     |   |     |   |
| MCSR     | Unchanged                                                                                 |   |     |   |     |   |
| DEAR     | Unchanged                                                                                 |   |     |   |     |   |
| Vector   | IVPR <sub>0:23</sub>    0xB0                                                              |   |     |   |     |   |

### 15.8.5.13 System Reset Interrupt

The System Reset exception is a non-maskable, asynchronous exception signaled to the processor through the assertion of system-defined signals.

A System Reset may be initiated by either a software reset or during power-on reset.

When a reset request occurs, the processor branches to the system reset exception vector without attempting to reach a recoverable state. If reset occurs during normal operation, all operations cease and the machine state is lost.

The following table lists register settings when a System Reset interrupt is taken.

**Table 15-41. System Reset Interrupt—register settings**

| Register | Setting description |   |    |   |     |   |
|----------|---------------------|---|----|---|-----|---|
| CSRR0    | Undefined           |   |    |   |     |   |
| CSRR1    | Undefined           |   |    |   |     |   |
| MSR      | SPV                 | 0 | FP | 0 | FE1 | 0 |
|          | WE                  | 0 | ME | 0 | IS  | 0 |

*Table continues on the next page...*

**Table 15-41. System Reset Interrupt—register settings (continued)**

| Register | Setting description        |   |     |   |     |   |
|----------|----------------------------|---|-----|---|-----|---|
|          | CE                         | 0 | FE0 | 0 | DS  | 0 |
|          | EE                         | 0 | DE  | 0 | PMM | 0 |
|          | PR                         | 0 |     |   | RI  | 0 |
| ESR      | Cleared                    |   |     |   |     |   |
| DEAR     | Undefined                  |   |     |   |     |   |
| Vector   | [p_rstbase[0:29]]    2'b00 |   |     |   |     |   |

## 15.9 Memory Protection Unit (MPU)

### 15.9.1 MPU Overview

The e200z4251n3 Memory Protection Unit (MPU) protects regions of memory, with the following feature set:

- 24-entry region descriptor table with support for 6 arbitrary-sized instruction memory regions, 12 arbitrary-sized data memory regions, and 6 additional arbitrary-sized regions programmable as instruction or data memory regions
- Ability to set access permissions and memory attributes on a per-region basis
- Process ID aware, with per-bit masking of TID values
- Capability for masking upper address bits in the range comparison
- Capability of bypassing permissions checking for selected access types
- Per-entry write-once logic for entry protection
- Hardware flash invalidation support and per-entry invalidation protection controls
- Ability to optionally utilize region descriptors for generating debug events and watchpoints
- Software managed by **mpure** and **mpuwe** instructions

### 15.9.2 Software Interface and MPU Instructions

The MPU entries are accessed indirectly through several MPU Assist (MAS) registers. Software can write and read the MAS registers with **mtspr** and **mfspir** instructions. These registers contain information related to reading and writing a given entry within the MPU. Data is read from the MPU into the MAS registers with an **mpure** (MPU read entry) instruction. Data is written to the MPU from the MAS registers with an **mpuwe** (MPU write entry) instruction.

The **mpure**, **mpuwe**, and **mpusync** instructions are privileged.

#### 15.9.3 MPU Read Entry Instruction (mpure)

The MPU read entry instruction causes the content of a single MPU entry to be placed in the MPU assist registers. The entry is specified by the INST, SHD, and ESEL fields of the MAS0 register. The entry contents are placed in the MAS0, MAS1, MAS2, and MAS3 registers.

```
mpu_entry_id = MAS0(INST, SHD, ESEL)
result = MPU(mpu_entry_id)
MAS0, MAS1, MAS2, MAS3 = result
```

#### 15.9.4 MPU Write Entry Instruction (mpuwe)

The MPU write entry instruction causes the contents of certain fields within the MPU assist registers MAS0, MAS1, MAS2, and MAS3 to be written into a single MPU entry in the MPU. The entry written is specified by the INST, SHD, and ESEL fields of the MAS0 register.

```
mpu_entry_id = MAS0(INST, SHD, ESEL)
MPU(mpu_entry_id) = MAS0, MAS1, MAS2, MAS3
```

15.9.5 MPU Synchronize Instruction (mpusync)

The MPU Synchronize instruction is treated as a privileged no-op by the core.

15.9.6 MMU/MPU Configuration Register (MMUCFG)

The MMU/MPU Configuration Register (MMUCFG) is a 32-bit read-only register. The SPR number for MMUCFG is 1015 in decimal. MMUCFG provides information about the configuration of the e200z4251n3 MPU design. The MMUCFG register is shown in the following figure.

Figure 15-17. MMU/MPU Configuration Register (MMUCFG)

The MMUCFG bits are described in the following table.

Table 15-42. MMUCFG field descriptions

| Bits  | Name    | Function                                                                                                    |
|-------|---------|-------------------------------------------------------------------------------------------------------------|
| 0:7   | —       | Reserved                                                                                                    |
| 8:14  | RASIZE  | Number of Bits of Real Address supported<br>0100000 This version of the MPU implements 32 real address bits |

### 15.9.7 MPU0 Configuration Register (MPU0CFG)

The MPU0 Configuration Register (MPU0CFG) is a 32-bit read-only register. The SPR number for MPU0CFG is 692 in decimal. MPU0CFG provides information about the configuration of MPU0 in the e200z4251n3 MPU. The MPU0CFG register is shown in following figure.

**Figure 15-18. MPU0 Configuration Register (MPU0CFG)**

The MPU0CFG bits are described in the following table.

**Table 15-43. MPU0CFG field descriptions**

| Bits  | Name    | Function                                                                                                                                              |
|-------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | FASSOC  | Fully Associative<br>1 Indicates that MPU0 is fully associative                                                                                       |
| 1:7   | —       | Reserved for non-fully associative implementation use                                                                                                 |
| 8:11  | MINSIZE | Minimum Region Size<br>Due to the use of access address matching, the effective smallest region size is 8 bytes<br>0x0 Smallest region size is 1 byte |

### 15.9.8 MPU0 Control and Status Register 0 (MPU0CSR0)

The MPU0 Control and Status Register 0 (MPU0CSR0) is a 32-bit register. The SPR number for MPU0CSR0 is 1014 in decimal. MPU0CSR0 controls the operation of the MPU. The MPU0CSR0 register is shown in the following figure.

**Figure 15-19. MPU0 Control and Status Register 0 (MPU0CSR0)**

#### Note

<sup>1</sup> Reset by processor reset **p\_reset\_b** if EDBCR0<sub>EDM</sub> = 0, as well as unconditionally by an internal power-on reset signal. If EDBCR0<sub>EDM</sub> = 1, EDBRAC0 masks off hardware-owned resources from reset by **p\_reset\_b** and only software-owned resources indicated by EDBRAC0 will be reset by **p\_reset\_b**. Specifically, this applies to the DRDEN, DWDEN, and IDEN control bits.

The MPU0CSR0 bits are described in the following table.

**Table 15-44. MPU0CSR0 field descriptions**

| Bits | Name | Description |
|------|------|-------------|
| 0:15 | —    | Reserved    |

|------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      |      | <p>This bit enables operation of the MPU. When enabled, access addresses are compared to each entry in the MPU for a match condition. If no match condition occurs, and the access type is not enabled to bypass the MPU protections, then an ISI or DSI condition is signaled for the access. Note that this bit is ignored for matching entries with DEBUG = 1 if in EDM and hardware owns MPU Debug entries.</p> <p>0 MPU is disabled<br/>1 MPU is enabled</p> |

### 15.9.9 MPU Assist Registers (MAS)

The core uses four special-purpose registers (MAS0, MAS1, MAS2, and MAS3) to facilitate reading and writing MPU entries. The MAS registers can be read or written using the **mf spr** and **mt spr** instructions.

The MAS0 register is shown in [Figure 15-20](#). Fields are defined in [Table 15-45](#).

|       |       |     |   |   |    |       |      |     |   |    |    |      |    |    |    |    |       |    |    |    |    |    |       |       |      |                   |    |    |    |    |                |   |

**Figure 15-24. MPU Assist Registers Summary**

### Note

<sup>1</sup> This bit is not implemented in dedicated instruction entries, and is ignored in shared entries with INST = 1

## 15.10 Local memories

### 15.10.1 Local Data memory overview

Local Data (DMEM) memory has been added to provide low latency access for critical instruction routines and data operands. Access latency (zero wait-states) is similar to that of a data cache, but does not suffer from the overhead of cache miss or cache writethrough operations. Instead, it provides a large capacity tightly coupled storage.

The local memory has one dedicated port for CPU accesses and another shared slave port for external accesses. DMEM provides a dedicated port to the CPU's load/store unit. Access via the dedicated CPU port is referred to as *front door* access. Access via the slave port is referred to as *back door* access.

Local memory occupies a portion of the processor's address space and is conditionally accessed in parallel with the corresponding cache (if present) when a CPU request is made, based on an address decode comparison early in the access pipeline.

External masters use the shared slave port, which is implemented as an AHB 2.v6 slave interface, to access the DMEM. Slave port accesses are arbitrated with the CPU port in a round-robin fashion to prevent starvation from occurring on either port.

### NOTE

DMEM, by default, is always accessed through the front door (CPU) interface, regardless of whether the program uses Decorated Access, Non-decorated Cache Bypass, Atomic Load and Reserve instructions, as well as regular load/store instructions (stw, lwz, for example). The only exception is when the core's DMEMCTL0 register is set to bypass the type of DMEM access used onto AHB back door slave interface. Regular load/store instructions always access DMEM through the front door interface since no bypass control is available for these kinds of instructions.

## 15.10.2 Local memory control and configuration

DMEM local memory configuration information is provided by a set of privileged read-only SPRs that are accessed using **mf spr** instructions. DMEM local memory operation is controlled by a set of privileged device control registers (DCRs) that are accessed using the **mf dcr** and **mt dcr** instructions. These registers and a description of the operation of various features are described in the following subsections.

### 15.10.2.1 DMEM Configuration Register 0 (DMEMCFG0)

The DMEM Configuration Register 0 (DMEMCFG0) is a 32-bit read-only register. DMEMCFG0 provides information about the configuration of the e200z4251n3 local data memory design. The contents of the DMEMCFG0 register can be read using a **mf spr** instruction. The SPR number for DMEMCFG0 is 694 in decimal. The DMEMCFG0 register is shown in the following figure.

### 15.10.2.2 DMEM Control Register 0 (DMEMCTL0)

The DMEM Control Register 0 (DMEMCTL0) controls operation of certain functions of the DMEM logic.

| Bits  | Name          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0:15  | DMEM BASEADDR | <p>DMEM BASE ADDRESS Field (CPU Port)</p> <p>This field defines the Base Address used for the CPU port to the DMEM when the external base address port inputs are disabled via the DBAPD control bit.</p> <p><b>Note:</b> Changes to this value and to the BAPD control bit must be performed carefully by software to ensure coherency is maintained. Specifically, software must ensure that no cached entries are present in the D-Cache for the memory space to be occupied by the DMEM.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 16:18 | —             | Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 19    | DBYPCB        | <p>DMEM Bypass Cache Bypass CPU accesses</p> <p>DBYPCB can be used to force Non-decorated Cache Bypass loads and Store with Writethrough (<b>lbcbx</b>, <b>lhcbx</b>, <b>lwc bx</b>, and <b>stwwtx</b>, <b>sthwt x</b>, <b>stbwt x</b>) accesses that target the DMEM address space to be presented to the external bus. Note that the protection settings in DMEMCTL1 are still applied to these accesses.</p> <p>0 Non-decorated Cache Bypass loads and Store with Writethrough CPU accesses do not bypass the DMEM CPU port.</p> <p>1 Non-decorated Cache Bypass loads and Store with Writethrough CPU accesses bypass the DMEM CPU port and are routed out through the BIU to the DAHB external interface.</p> <p><b>Note:</b> This field is updated by Reset from an internal power-on reset signal or by an internal destructive reset signal based on the value of the <b>p_dmem_rstcfg[8]</b> input, which is internally hard coded.</p> |
| 20    | DBYPAT        | <p>DMEM Bypass Atomic CPU accesses</p> <p>DBYPAT can be used to force atomic (load and reserve, store conditional) accesses to the DMEM address space to be presented to external reservation hardware in systems that support reservation and/or decoration functionality, since no internal reservation hardware is present in the CPU for the DMEM. In general, software must not rely on normal CPU write accesses to clear a reservation, since they are not monitored by reservation hardware; instead only store conditional accesses should be used for this purpose. Note that the protection settings in DMEMCTL1 are still applied to these accesses.</p> <p>0 Atomic CPU accesses do not bypass the DMEM CPU port.</p> <p>1 Atomic CPU accesses bypass the DMEM CPU port and are routed out through the BIU to the DAHB external interface.</p>                                                                                      |

Table 15-50. DMEMCTL0 field descriptions (continued)

| Bits | Name    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      |         | <b>Note:</b> This field is updated by Reset from an internal power-on reset signal or by an internal destructive reset signal based on the value of the <b>p_dmem_rstcfg[6]</b> input, which is internally hard coded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 21   | DBYPDEC | <p>DMEM Bypass Decorated CPU accesses</p> <p>DBYPDEC can be used to force decorated accesses (<b>lbdx, lhdz, lwdx, lbdcbx, lhdcbx, lwdcbx, stbdx, sthdz, stwdx, stbdcx, sthdcx, stwdcbx, dsn, dsncb</b>) to the DMEM address space to be presented to external decoration hardware for systems that support this functionality, since no internal decoration hardware is present in the CPU. Note that the protection settings in DMEMCTL1 are still applied to these accesses.</p> <p>0 Decorated Load and Store CPU accesses do not bypass the DMEM CPU port.</p> <p>1 Decorated Load and Store CPU accesses bypass the DMEM CPU port and are routed out through the BIU to the DAHB external interface.</p> <p><b>Note:</b> This field is updated by Reset from an internal power-on reset signal or by an internal destructive reset signal based on the value of the <b>p_dmem_rstcfg[7]</b> input, which is internally hard coded.</p> |
| 22   | DECUE   | <p>DMEM Error Correction Update Enable</p> <p>DECUE can be used in conjunction with DCPECE and DSECE to provide an error scrubbing function for the DMEM.</p> <p>0 Error Correction Update is disabled.</p> <p>1 Error Correction Update is enabled. A correctable single-bit error detected on a read access from either the CPU or the slave port will cause the DMEM to be rewritten with the corrected data if the corresponding error checking enable bit is set (DCPECE for CPU accesses, DSECE for slave port accesses). (Write accesses perform this correction automatically during partial-width writes when error checking is enabled.)</p> <p><b>Note:</b> This field is updated by Reset from an internal power-on reset signal or by an internal destructive reset signal based on the value of the <b>p_dmem_rstcfg[0]</b> input which is internally hard coded.</p>                                                          |
| 23   | —       | Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 24   | DBAPD   | <p>DMEM Base Address Port Disable</p> <p>This bit controls usage of the external Base Address port to define the base address of the DMEM for CPU port accesses. It has no effect on DMEM slave port accesses.</p> <p>0 The external DMEM base address port is used to define the base address of the DMEM for CPU accesses.</p> <p>1 The external DMEM base address port is disabled for use, and instead the BASE ADDR field value is used to define the base address of the DMEM for CPU accesses.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 25   | DPEIE   | <p>DMEM Processor Error Injection Enable</p> <p>DPEIE will cause injection of errors regardless of the setting of DCPECE, although reporting of errors to the CPU will be masked while DCPECE = 0.</p> <p>0 Error Injection is disabled.</p> <p>1 A double-bit error will be injected on each CPU port write into the DMEM data array by inverting the two uppermost parity check bits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 26   | DICWE   | <p>DMEM Imprecise CPU Write Enable</p> <p>DICWE may allow for increased partial-width write performance when set.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 15-50. DMEMCTL0 field descriptions (continued)**

| Bits  | Name   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       |        | <p>0 Imprecise writes by the CPU are disabled. All partial-width write ECC errors are reported precisely (error report machine check).</p> <p>1 Imprecise writes by the CPU are enabled. In certain cases, partial-width write errors may be reported imprecisely (async machine check only).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 27:28 | DSWCE  | <p>DMEM Slave port Write Check/Correct Enable</p> <p>00 Slave write data is not checked or corrected for errors.</p> <p>01 Slave write data is checked but not corrected for errors. Detected errors generate a slave port ERROR response and no Write is performed to the DMEM.</p> <p>10 Slave write data is checked and corrected for errors on all writes. Single-bit correctable errors do not automatically generate an ERROR response, but are instead corrected.</p> <p>11 Slave write data is checked and corrected for errors on partial-width (1, 2, 3, 5, 6, or 7 byte, or misaligned 4-byte) writes. Single-bit correctable errors on partial-width writes do not automatically generate an ERROR response, but are instead corrected. Aligned word or doubleword writes are not checked or corrected for errors.</p> <p><b>Note:</b> This field is updated by Reset from an internal power-on reset signal or by an internal destructive reset signal based on the values of the <b>p_dmem_rstcfg[1:2]</b> inputs, which are internally hard coded.</p> |
| 29    | DDAUEC | <p>DMEM Disable Address Use in Error Check</p> <p>This bit controls usage of the address portion of the ECC H matrix. When use is disabled, the address portions are not used for checkbit/syndrome generation for DMEM CPU or slave port accesses.</p> <p>0 Use of access address is enabled in checkbit and syndrome generation.</p> <p>1 Use of access address is disabled in checkbit and syndrome generation.</p> <p><b>Note:</b> This field is updated by Reset from an internal power-on reset signal or by an internal destructive reset signal based on the value of the <b>p_dmem_rstcfg[3]</b> input, which is an internally hardcoded signal.</p>                                                                                                                                                                                                                                                                                                                                                                                                         |
| 30    | DCPECE | <p>DMEM CPU Port ECC Enable (CPU port)</p> <p>0 End-to-End ECC is disabled for the CPU interface. No checking of read data is performed by the CPU. Writes will still generate the proper check bit values to be written.</p> <p>1 End-to-End ECC is enabled for performing ECC on the CPU interface. Error checking of read data is performed with single-bit error correction. Detection of uncorrectable single- or multi-bit errors on a CPU port access cause a machine check to be generated.</p> <p><b>Note:</b> This field is updated by Reset from an internal power-on reset signal or by an internal destructive reset signal based on the value of the <b>p_dmem_rstcfg[4]</b> input, which is internally hard coded.</p>                                                                                                                                                                                                                                                                                                                                 |
| 31    | DSECE  | <p>DMEM Slave port Error Checking Enable (Slave port)</p> <p>0 End-to-End ECC checking logic is disabled for the Slave interface. ### 15.10.2.3 DMEM Control Register 1 (DMEMCTL1)

The DMEM Control Register 1 (DMEMCTL1) provides protection functions for the DMEM. Separate Supervisor-mode and User-mode read and write access controls allow accesses to be granted, denied, or conditionally granted independently for four equally sized blocks of DMEM. Conditional granting of access permissions causes the MPU memory protection functions to be employed. All other settings override MPU settings. The DMEMCTL1 settings are applied to all accesses that target DMEM address range, regardless of whether access may bypass the DMEM based on settings in DMEMCTL0<sub>DBYPCB, DBYPATF, DBYPDEC</sub>.

## 15.11 End-to-End ECC Support

This section describes end-to-end error detection and correction capability (e2eECC) enhancements to address additional diagnostic capabilities for the next generation of embedded designs.

### 15.11.1 End-to-End ECC control and configuration

e2eECC is controlled by a set of privileged device control registers (DCRs) accessed using the **mfdcr** and **mtocr** instructions. These registers and the operation of various features are described in the following subsections.

### 15.11.1.1 End-to-End ECC Control Register 0 (E2ECTL0)

The End-to-End ECC Control Register 0 (E2ECTL0) controls operation of the e2eECC logic.

**Figure 15-28. e2eECC Control Register 0 (E2ECTL0)**

**Table 15-52. E2ECTL0 field descriptions**

| Bits | Name   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0:27 | —      | Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 15-52. E2ECTL0 field descriptions**

| Bits | Name | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      |      | <p>1 End-to-End ECC is enabled for performing error detection and correction on the Data interface. Checking of read data is performed with correction of single-bit data errors. Detection of any address errors, or uncorrectable multi-bit data errors cause a machine check to be generated. Writes generate the proper check bit values to be supplied to external storage devices.</p> <p><b>Note:</b> This field is updated on <b>p_reset_b</b> based on the value of the <b>p_e2e_rstcfg[3]</b> input.</p> |

e2eECC is enabled by setting the [I,D]ECCEN bit of the E2ECTL0 DCR to a 1. On reset, e2eECC operation may be disabled from detecting or correcting errors based on reset configuration inputs, and no exceptions will be signaled for nonzero calculated syndrome values. This allows for the proper initialization of stored checkbits in any volatile storage by the CPU without causing error conditions due to uninitialized storage. Following the initialization, software may enable e2eECC operation by writing the appropriate values to the E2ECTL0<sub>[I,D]ECCEN</sub> control bits.

The E2ECTL0<sub>[I,D]DAC</sub> control bits can be used to remove the address checking component of the ECC logic for the Instruction AHB and Data AHB when address inclusion is not desired.

### 15.11.1.2 End-to-End ECC fault injection by software

Fault injection provides a way to test error recovery and portions of the error detection/correction logic by intentionally injecting parity errors into the driven checkbit information on the external bus during write operations. No provision is made to generate internal errors on read data due to timing issues; instead, software may intentionally generate errors in the checkbit values to emulate data, address, or checkbit error on external bus write cycles, and read back the written data to cause an error to be detected.

The End-to-End ECC Error Control/Status Register (E2EECSR0) controls operation of the e2eECC error injection logic. It allows for generation of a single error injection operation on the next CPU data write to the external bus only, or for a series of error injection write operations to the external bus, using the WRC and INVC control fields. The WRCHKBIT/CHKINVT field controls which of the **p\_hwchkbit[7:0]** outputs are affected.

Control is provided to allow for either inverting the value(s) of one or more of the checkbit outputs **p\_hwchkbit[7:0]** in hardware on one or more external write accesses, or for software to directly supply checkbit values to be used for the external write access(es).

The End-to-End ECC Error Control/Status Register (E2EECSR0) also supports access to raw checkbit values via the RCHKBIT status field. This field is updated with checkbit values received on each CPU data read operation to either the DMEM or to the external bus (but not on cache hits). For the case of an external read access that receives an ERROR response (HRESP=ERR), the RCHKBIT field is written with all zeros.

Note that Nexus 3 accesses do not cause error injection or the capture of read checkbits, regardless of the settings of the E2EECSR0 register.

The following figure shows the layout of E2EECSR0.

**Figure 15-29. e2eECC Error Control/Status Register 0 (E2EECSR0)**

**Table 15-53. E2EECSR0 field descriptions**

| Bits  | Name    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 0:3   | —       | Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 4:11  | RCHKBIT | Read Checkbits<br><br>This field provides the raw checkbits received on the last CPU data access to the DMEM or to external memory via the Data BIU. This field corresponds bit-wise to <b>p_hrchkbit[7:0]</b> for external reads and to <b>p_dchk[0:7]</b> for DMEM read accesses. Software may use this information to determine the stored checkbits of external memories or the DMEM by performing CPU load operations and then accessing this field prior to the next load operation (assuming interrupts are masked). If the CPU receives an ERROR response (HRESP=ERR) on an external read access, the RCHKBIT field is written with all zeros.                                                                                                                      |
| 12:15 | —       | Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

# Chapter 16

## System Integration Unit Lite2 (SIUL2)

### 16.1 Introduction

#### 16.1.1 Overview

The System Integration Unit Lite2 provides control over all the electrical pin controls and as many as 32 ports with 16 bits of bidirectional, general-purpose input and output signals. One of the most important functions of the SIUL2 is that it enables the user to select the functions and electrical characteristics that appear on external device pins. It also controls the multiplexing of internal signals from one module to another and controls device I/O. It supports as many as 32 external interrupts with trigger event configuration. The following figure is the block diagram of SIUL2 and its interfaces to other system components.

This module provides dedicated pad control to general-purpose pads that can be configured as either inputs or outputs. The SIUL2 module provides registers that enable user software to read values from GPIO pads configured as inputs, and write values to GPIO pads configured as outputs:

- When configured as output, you can write to an internal register to control the state driven on the associated output pad.
- When configured as input, you can detect the state of the associated pad by reading the value from an internal register.
- When configured as input and output, the pad value can be read back, which can be used as a method of checking if the written value appeared on the pad.

To assist software development, GPIO data registers can be accessed using various mechanisms. These differing mechanisms allow support for port access or for bit manipulation without the need to use read-modify-write operations or access with Power Architecture reservation.

- Access to two 16-bit ports in one access
- Read/write access to a single bit
- A 16-bit port write with a bit mask, using single 32-bit access.

The external interrupt sources can be configured at the MCU level to be used with any chip pad. From 1 to 32 of the interrupt sources can be configured to have a digital filter to reject short glitches on the inputs. The external interrupt/DMA requests map to the REQ pins in the device packages.

Figure 16-1. System Integration Unit Lite2 block diagram

## 16.1.2 Features

The System Integration Unit Lite2 supports these distinctive features:

- 1 to 32 GPIO ports with data control
  - Drive data to as many as 16 independent I/O channels
  - Sample data from as many as 16 independent I/O channels

Two 16-bit registers can be read/written with one access for a 32-bit port, if needed.

External interrupt/DMA request support with:

- 1 to 4 system interrupt vectors for 1 to 4 interrupt sources with independent interrupt masks. For 32 external interrupt sources (REQ pins), four groups have eight interrupt sources each, and each of the four groups is assigned one system interrupt vector.
- 1 to 32 programmable digital glitch filters, one for each REQ pin
- 1 to 4 system DMA request channels for 1 to 4 REQ pins
- Edge detection

Additionally the SIUL2 contains the Multiplexed Signal Configuration Registers (MSCR) that configure the electrical parameters and settings for as many as 512 functional pads. The number of these registers that is actually implemented varies by device. These registers configure the following pad features:

- Drive strength
- Output impedance control
- Open drain/source output enable
- Slew rate control
- Hysteresis control
- Internal pull control and pull selection
- Pin function assignment
- Control of analog path switches
- Safe mode behavior configuration

### 16.1.3 Register protection

The System Integration Unit Lite2 uses the Register Protection Scheme to protect the individual registers from accidental writes. The following registers can be protected:

- SIUL2 DMA/Interrupt Request Enable Register 0 (SIUL2\_DIRER0)
- SIUL2 DMA/Interrupt Request Select Register 0 (SIUL2\_DIRSR0)
- SIUL2 Interrupt Rising-Edge Event Enable Register 0 (SIUL2\_IREEER0)
- SIUL2 Interrupt Falling-Edge Event Enable Register 0 (SIUL2\_IFEER0)
- SIUL2 Interrupt Filter Enable Register 0 (SIUL2\_IFER0)
- SIUL2 Interrupt Filter Maximum Counter Register (SIUL2\_IFMCR0 to SIUL2\_IFMCR31)
- SIUL2 Interrupt Filter Clock Prescaler Register (SIUL2\_IFCPR)
- SIUL2 Multiplexed Single Configuration Register (SIUL2\_MSCR0 to SIUL2\_MSCR511 and SIUL2\_IMCR0 to SIUL2\_IMCR511): Only the specific MSCRs and IMCRs that are actually implemented on a device are protected.

A compiled list identifies the protected registers at specific addresses for this device.

## 16.2 Memory map and register description

This section provides a detailed description of all registers accessible in the SIUL2 module in address order. Each description includes a standard register diagram. Details of register bit and field function follow the register diagrams, in bit order.

The following table lists the implemented SIUL2 registers.

### NOTE

Undocumented register spaces in the SIUL2 memory map, including addresses shown as "blank," are reserved. Reserved registers read as 0, and writes to these registers have no effect. If supported and enabled by the MCU, a transfer error is issued for attempts to access a completely reserved register space unless it is an 8 bit access. Do not expect transfer errors on 8 bit

accesses to reserved register space. A write to a reserved register bit has no effect.

### SIUL2 memory map

| Address offset (hex) | Register name                                                       | Width (in bits) | Access | Reset value                 | Section/ page              |
|----------------------|---------------------------------------------------------------------|-----------------|--------|-----------------------------|----------------------------|
| 4                    | SIUL2 MCU ID Register #1 (SIUL2_MIDR1)                              | 32              | R      | <a href="#">See section</a> | <a href="#">16.2.1/471</a> |

**16.2.1 SIUL2 MCU ID Register #1 (SIUL2\_MIDR1)**

This register holds identification information about the device.

**NOTE**

This register supports only 32-bit accesses. Byte and half-word accesses are not supported.

**NOTE**

See the chip-specific SIUL2 information for this register's reset value.

Address: 0h base + 4h offset = 4h

**16.2.2 SIUL2 MCU ID Register #2 (SIUL2\_MIDR2)****NOTE**

This register supports only 32-bit accesses. Byte and half-word accesses are not supported.

**NOTE**

See the chip-specific SIUL2 information for this register's reset value.

Address: 0h base + 8h offset = 8h

**16.2.3 SIUL2 DMA/Interrupt Status Flag Register0 (SIUL2\_DISR0)**

The DMA/Interrupt Status Register contains flag bits that record an event on the external IRQ pins. When an event as defined in IRQ Rising-Edge Event Enable Register (SIUL2\_IREER0) and IRQ Falling-Edge Event Enable Register (SIUL2\_IFEER0) occurs, the corresponding flag bit is set. The IRQ Flag bit is set regardless of the state of the corresponding DMA/Interrupt Request Enable bit in DMA/Interrupt Request Enable Register (SIUL2\_DIRER0) - Standard. The IRQ Flag bit remains set until cleared by software or through the servicing of a DMA request. The IRQ Flag bits are cleared by writing a '1' to the bits. A write of '0' has no effect. The number of bits implemented is specified by the parameter that defines the number external IRQ pins.

## Memory map and register description

This register supports 8-, 16-, and 32-bit accesses.

Address: 0h base + 10h offset = 10h

### 16.2.4 SIUL2 DMA/Interrupt Request Enable Register0 (SIUL2\_DIRER0)

The DMA/Interrupt Request Enable Register enables the assertion of DMA or interrupt request if the corresponding External IRQ Flag bit is set in [SIUL2 DMA/Interrupt Status Flag Register0 \(SIUL2\\_DISR0\)](#). The type of request enabled is determined by the corresponding DMA/Interrupt Request Select bit in [SIUL2 DMA/Interrupt Request Select Register0 \(SIUL2\\_DIRSR0\)](#). The number of bits implemented is specified by the parameter that defines the number of external IRQ pins. This register is used to enable the interrupt messaging to the interrupt controller.

This register supports 8-, 16-, and 32-bit accesses.

Address: 0h base + 18h offset = 18h

| Bit   | 0      | 1      | 2      | 3      | 4      | 5      | 6      | 7      | 8      | 9      | 10     | 11     | 12     | 13     | 14     | 15     |

**SIUL2\_DIRER0 field descriptions (continued)**

| Field | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | Interrupt or DMA requests from the corresponding EIF[x] bit are disabled               |
| 1     | Set EIF[x] bit causes either a DMA or an interrupt request depending on DIRSR register |

**16.2.5 SIUL2 DMA/Interrupt Request Select Register0 (SIUL2\_DIRSR0)**

The DIRSR selects between the DMA or interrupt request. If the corresponding bits are set in [SIUL2 DMA/Interrupt Status Flag Register0 \(SIUL2\\_DISR0\)](#) and [SIUL2 DMA/Interrupt Request Select Register0 \(SIUL2\\_DIRSR0\)](#), then the DMA/Interrupt Request Select bit determines whether DMA or an interrupt request is asserted. The number of bits implemented is specified by the parameter that defines the number of DMA request outputs.

This register supports 8-, 16-, and 32-bit accesses.

Address: 0h base + 20h offset = 20h

## 16.2.6 SIUL2 Interrupt Rising-Edge Event Enable Register 0 (SIUL2\_IREE0)

This register is used to enable the rising-edge triggered events on the corresponding interrupt pads.

This register supports 8-, 16-, and 32-bit accesses.

Address: 0h base + 28h offset = 28h

| Bit   | 0      | 1      | 2      | 3      | 4      | 5      | 6      | 7      | 8      | 9      | 10     | 11     | 12     | 13     | 14     | 15     |

**16.2.7 SIUL2 Interrupt Falling-Edge Event Enable Register 0 (SIUL2\_IFEER0)**

This register is used to enable falling-edge triggered events on the corresponding interrupt pads.

This register supports 8-, 16-, and 32-bit accesses.

**NOTE**

If both the IREE bit and IFEE bits are cleared for the same interrupt source, the interrupt status flag for the corresponding external interrupt will never be set.

Address: 0h base + 30h offset = 30h

**16.2.8 SIUL2 Interrupt Filter Enable Register 0 (SIUL2\_IFER0)**

This register is used to enable a digital filter counter on the corresponding interrupt pads to filter out glitches on the inputs. The number of interrupts supporting this feature is MCU dependent and can be configured between 1 and 32.

This register supports 8-, 16-, and 32-bit accesses.

Address: 0h base + 38h offset = 38h

### 16.2.9 SIUL2 Interrupt Filter Maximum Counter Register (SIUL2\_IFMCR<sub>n</sub>)

These registers are used to configure the filter counter associated with each digital glitch filter.

**NOTE**

These registers support only 32-bit accesses. Byte and half-word accesses are not supported.

Address: 0h base + 40h offset + (4d × i), where i=0d to 31d

| 28–31<br>MAXCNT  | <p>Maximum Interrupt Filter Counter setting</p> <p>MAXCNT can be 0d to 15d.</p> <ul style="list-style-type: none"> <li>For a MAXCNT value of 0d, 1d, or 2d, the filter behaves as an ALL PASS filter.</li> <li>For a MAXCNT value of 3d to 15d, the filter period is <math>TCK \times MAXCNT + n \times TCK</math>, where n is 0, 1, 2, 3, or 4.</li> </ul> <p>TCK is the prescaled filter clock period, which is the IRC clock prescaled to the IFCPR value, which is specified in SIUL2_IFCPR.</p> <p>TIRC is the basic filter clock period: 62.5 ns (<math>f = 16</math> MHz).</p> <p><b>NOTE:</b> The filter delay is 2 TCK clock cycles more than the filter period.</p> <p>In general, TFILTER and TDELAY are not integer multiples of TCK because DIN is asynchronous whereas DOUT is synchronous with respect to the CK clock. The factor n accounts for this uncertainty in filter period calculation.</p> |

## 16.2.10 SIUL2 Interrupt Filter Clock Prescaler Register (SIUL2\_IFCPR)

This register is used to configure a clock prescaler which is used to select the clock for all digital filters. A prescaler is applied to the input clock to the SIUL2, which is the system AIPS clock counter in the SIUL2.

**NOTE**

This register supports only 32-bit accesses. Byte and half-word accesses are not supported.

Address: 0h base + C0h offset = C0h

**16.2.11 SIUL2 Multiplexed Signal Configuration Register (SIUL2\_MSCR<sub>n</sub>)**

These registers select which source signal is connected to the register's associated destination, which is a chip pin that is or can be configured as an output.

For the associated chip-pin destination, the register also specifies the pin's electrical properties.

**Figure 16-2. MSCR pin connection**

The fields in an MSCR vary depending on its associated destination (chip pin).

For chip-pin MSCR assignments, pin types, APC support, and SSS values, see the pin-description table for your chip.

**NOTE**

This register supports only 32-bit accesses. Byte and half-word write accesses are not supported.

| 28–31<br>SSS      | Source Signal Select<br>Selects which source signal is connected to the associated destination (chip pin). This field has a variable width depending on the number of alternate functions available for that pin. For a chip pin, the source signals are outputs from module ports. |

16.2.12 SIUL2 Input Multiplexed Signal Configuration Register (SIUL2\_IMCRn)

Selects which source signal is connected to the register's associated destination, which is an internal module port that is or can be configured as an input.

Figure 16-3. IMCR module-port connection

The fields in an IMCR vary depending on its associated destination (module port). For IMCR assignments and SSS values, see the pin-description table for your chip.

NOTE

This register supports only 32-bit accesses. Byte and half-word write accesses are not supported.

**16.2.13 SIUL2 GPIO Pad Data Output Register (SIUL2\_GPDO<sub>n</sub>)**

These registers can be used to set or clear a single GPIO pad with a byte access.

These registers support 8-, 16-, and 32-bit accesses.

Address: 0h base + 1300h offset + (4d × i), where i=0d to 38d

**16.2.15 SIUL2 Parallel GPIO Pad Data Out Register (SIUL2\_PGPDO<sub>n</sub>)**

These registers are used to set or clear the respective pads of the device. Parallel port registers for input (PGPDI) and output (PGPDO) are provided to allow a complete port to be written or read in one operation, dependent on the individual pad configuration. The difference between PGPDO and GPDO is that PGPDO registers can be used to set the values of all output pins assigned to a device port with a single 16-bit register write vs. the GPDO registers, which are used to set the value on a specific pin with a byte write.

The SIUL2\_PGPDO registers access the same physical resource as the SIUL2\_PDO and SIUL2\_MPGPDO address locations. Some examples of the mapping:

- PPDO[0][0] = PDO[0]
- PPDO[2][0] = PDO[32]
- PPDO[31][15] = PDO[511]

These registers support 8-, 16-, and 32-bit accesses.

Address: 0h base + 1700h offset + (2d × i), where i=0d to 9d

**16.2.17 SIUL2 Masked Parallel GPIO Pad Data Out Register (SIUL2\_MPGPDO<sub>n</sub>)**

This register can be used to selectively modify the pad values associated to PPDO[x] [0:15]. The MPGPDO[x] register may only be accessed with 32-bit writes. 8-bit or 16-bit writes will not modify any bits in the register and cause a transfer error response by the module. Read access will return 0.

NOTE

This register supports only 32-bit accesses. Byte and half-word accesses are not supported.

Address: 0h base + 1780h offset + (4d × i), where i=0d to 9d

16.3 Functional description

16.3.1 General

This section provides a complete functional description of the System Integration Unit Lite2.

16.3.2 Pad Control

The SIUL2 is capable of controlling the electrical characteristics of as many as 512 pads. It provides a consistent interface for all pads, both on a by-port and a by-bit basis. The following describes the pad characteristics that can be supported by the SIUL2. Not all of these features are supported on all devices or on all pads. Support is dependent on the specific application needs and the pads implemented on the device.

The required controls are:

- Slew rate control
  - Offers improved EMC performance
  - Support for a fast and a slow slew rate
- Drive strength control
  - Offers improved EMC performance
  - As many as four different drive strength levels can be supported.
- Pull capability
  - Offers flexibility in the device configuration and the elimination of external hardware in some cases
  - The configuration of the pull on any pad should be independently controlled to be either pull-up, pull-down, or no-pull enabled
- Input and output buffer control
- Hysteresis
- Open drain
  - Needed to support different pads muxed (for example, to mux IIC with non-open drain pads)
- Pad output assignment
  - Defines which chip function has control over the output of the pad

The setting of each pad out of reset is fixed per MCU, but can be configured individually. In this way it is possible to select special pull settings or peripheral pad ownership per design.

It is possible for you to configure each pad independently of all other pads on the device or other pads grouped within a single port. This allows different pad types to be grouped together in ports and allows the necessary flexibility needed for the pads' individual operation. This is achieved by grouping all of the above functions into a single register for each pad on the device, and allows each pad to be configured with a single write to one register, allowing simplified duplication of software for each pad with indexed changes for each pad.

### 16.3.3 General Purpose Input and Output pads (GPIO)

The SIUL2 allows each pad to be configured as either a General Purpose Input or Output pad (GPIO), and as one or more alternate functions (input or output), the function of which is determined by the peripheral that uses the pad.

GPIO pads can also optionally be implemented without any alternate function.

The SIUL2 is designed to manage as many as 512 GPIO pads organized as ports that can be accessed for data reads and writes as 8-bit, 16-bit or 32-bit.

As shown in the following figure, all port accesses are identical, with each read or write being performed only at a different location to access a different port width.

**Figure 16-4. Data Port example arrangement showing configuration for different port width accesses**

This implementation requires that the registers are arranged in such a way as to support this range of port widths without having to split reads or writes into multiple accesses.

The SIUL2 has separate data input and data output registers for all pads, allowing the possibility of reading back an input or output value of a pad directly. This supports the ability to validate what is present on the pad rather than simply confirming the value that was written to the data register by accessing the data input registers.

The data output registers support both read and write operations.

The data input registers support read access only.

When a pad is configured to use one of its alternate functions, the data input values reflect the respective value of the pad. If a write operation is performed to the data output register for a pad configured as an alternate function (non-GPIO), this write will not be reflected by the pad value until re-configured to GPIO. All general purpose pads are implemented as bidirectional.

### Note

In case the bi-directional operation impacts performance (for example, ADC accuracy) or is not required for a specific pad function, you can limit the functionality of the pad to "Input Only."

#### 16.3.4 External interrupts/DMA requests (REQ Pins)

The SIUL2 supports 1 to 32 external interrupts, which can be allocated to any pad necessary at the MCU level. This allocation is fixed per MCU.

For the assignments of the external interrupts, see the Signal Description details.

The SIUL2 supports one to four interrupt vectors to the interrupt controller of the MCU. Each interrupt vector can support as many as eight external interrupt sources from the device pads.

For devices with a number of interrupt sources that is smaller than the maximum number, the MCU can implement either all four interrupt vectors with fewer sources or reduce the number of vectors as the number of sources are reduced. The following figure shows two sample scenarios.

**Figure 16-5. Example of different interrupt to vector mapping at MCU level**

All the external interrupt pads within a single group (maximum of eight pads) have equal priority. It is the responsibility of the user software to search through the group of sources in the most appropriate way for the application.

The priority of the vectors used by the external interrupt pads is fixed based on the platform and the interrupt controller and its priority levels, but the allocation of pads to each group of interrupts can be independently configured by the MCU.

An MCU-specific number of external interrupt lines can have digital glitch filters applied to them. The supported range is 1 to 32. The glitch filters need a running internal oscillator clock to work. If no such clock is available, external interrupts will be effectively disabled when the glitch filter is enabled on an interrupt line.

### 16.3.4.1 External interrupt initialization

When an external interrupt pin is first enabled, it is possible to get a false interrupt flag. To prevent a false interrupt request during pin interrupt initialization, the user must do the following:

- Mask interrupts by clearing the  $EIREn$  bits in  $DIRER0$
- Select the pin polarity by setting the appropriate  $IREEn$  bits in  $IREER0$  and the appropriate  $IFEEn$  bits in  $IFEER0$  as desired
- Configure the appropriate bits in the  $MSCR[0:511]$  register for the external interrupt pin(s) desired as follows:
  - Clear the OBE and ODE bits to disable output
  - Set the IBE bit to enable the pin's input buffer
  - If using the internal pullup/pulldown, configure the appropriate PUE and PUS fields

#### Note

$MSCR[SSS]$  bits do not need to be changed for either  $MSCR[0:511]$  or  $IMCR[0:511]$  because the external interrupt pin input is directly connected to the SIUL for EIRQ pins.

External interrupt pins should never be configured as outputs ( $MSCR[ODC]$  bits are not zeros) when external interrupt inputs are desired because false interrupts could be detected (such as from a GPIO configuration).

- Select the request desired between DMA or Interrupt by writing the appropriate  $DIRSn$  bits in  $DIRSR0$
- Select the desired glitch filter setup for the pins by writing the following:
  - Write the Filter Counter setting to the desired value by writing the  $MAXCNT[3:0]$  bits in the  $IFMCn$  register for the respective external interrupt that is being used

- Set the Filter Clock Prescaler setting from 0 to 15 to the desired value by writing the IFCP[3:0] bits in the IFCPR register
- Enable the glitch filter for the desired external interrupt pins by setting the appropriate IFEn bits in IFER0
- Write to EIFn bits in DISR0 to as desired to clear any flags
- Enable the interrupt pins by setting the appropriate EIREn bits in DIRER0

### 16.3.4.2 External interrupt management

The user can enable or disable each interrupt independently using a single rolled up register, SIUL2\_DIRER0.

A pad defined as an external interrupt can be configured by the user to recognize interrupts with an active rising edge, an active falling edge, or both edges being active. A setting of having both edge events disabled is reserved and should not be configured. The user controls the active IRQ edge through the registers SIUL2\_IREER and SIUL2\_IFEER.

Each external interrupt supports an individual flag which is held in the Flag register (DISR0). This register is a clear-by-write-1 register type, preventing inadvertent overwriting of other flags in the same register.

Refer to the following figure for an overview of the external interrupt implementation.

Figure 16-6. External interrupt pad diagram

### 16.3.4.3 External interrupt request

The REQ input pins on the device are sources for interrupt or DMA requests. The system has four possible interrupt vectors available for the REQ pins in the SIUL2. The mapping of 32 interrupt request sources to vectors and channels appears in the following table.

**Table 16-1. Interrupt source mapping to SIUL2 Interrupt request output for 32 interrupt sources**

| Vector/Channel # | Interrupt vector source                                                       |
|------------------|-------------------------------------------------------------------------------|
| 0                | REQ[07]   REQ[06]   REQ[05]   REQ[04]   REQ[03]   REQ[02]   REQ[01]   REQ[00] |
| 1                | REQ[15]   REQ[14]   REQ[13]   REQ[12]   REQ[11]   REQ[10]   REQ[09]   REQ[08] |
| 2                | REQ[23]   REQ[22]   REQ[21]   REQ[20]   REQ[19]   REQ[18]   REQ[17]   REQ[16] |
| 3                | REQ[31]   REQ[30]   REQ[29]   REQ[28]   REQ[27]   REQ[26]   REQ[25]   REQ[24] |

### 16.3.4.4 DMA requests

The REQ pins on the device map to independent DMA request channels in the DMA controller. The maximum four pins map corresponding to four DMA request channels. See the DMA request mapping details in the Device Configuration information.

# Chapter 17

## Crossbar Switch (XBAR)

### 17.1 Introduction

#### NOTE

For the chip-specific implementation details of this module's instances, see the chip configuration information.

The information found here provides information on the layout, configuration, and programming of the crossbar switch.

The crossbar switch connects bus masters and bus slaves using a crossbar switch structure. This structure allows all bus masters to access different bus slaves simultaneously, while providing arbitration among the bus masters when they access the same slave. A variety of bus arbitration methods and attributes may be programmed on a slave-by-slave basis.

#### 17.1.1 Features

The crossbar switch includes these features:

- Symmetric crossbar bus switch implementation
  - Allows concurrent accesses from different masters to different slaves
  - Slave arbitration attributes configured on a slave-by-slave basis
- Up to single-clock 64-bit transfer
- Support for burst transfers of up to 16 beats of data
- Low-Power Park mode support
- Dynamic master priority elevation

## 17.2 Memory Map / Register Definition

Each slave port of the crossbar switch contains configuration registers. Read- and write-transfers require two bus clock cycles. The registers can be read from and written to only in supervisor mode. Additionally, these registers can be read from or written to only by 32-bit accesses.

A bus error response is returned if an unimplemented location is accessed within the crossbar switch.

The CRS<sub>n</sub> and PRS<sub>n</sub> registers can be programmed to be read-only to prevent changes to their configuration. After being read-only protected, future writes to them will terminate with an error.

### NOTE

This section shows the registers for all eight master and slave ports. If a master or slave is not used on this particular device, then unexpected results occur when writing to its registers. See the chip configuration details for the exact master/slave assignments for your device.

All references to the crossbar switch registers are based on the physical port connections.

**17.2.1 Priority Registers Slave (XBAR\_PRSn)**

The priority registers (PRSn) set the priority of each master port on a per slave port basis and reside in each slave port. The priority register can be accessed only with 32-bit accesses. After the CRSn[RO] bit is set, the PRSn register can only be read; attempts to write to it have no effect on PRSn and result in a bus-error response to the master initiating the write.

Two available masters must not be programmed with the same priority level. Attempts to program two or more masters with the same priority level result in a bus-error response and the PRSn is not updated.

**NOTE**

Valid values for the Mn priority fields depend on which masters are available on the chip. This information can be found in the chip-specific information for the crossbar.

- If the chip contains less than five masters, values 0 to 3 are valid. Writing other values will result in an error.
- If the chip contains five or more masters, valid values are 0 to n-1, where n is the number of masters attached to the Crossbar Switch. Other values will result in an error.

**NOTE**

See the chip-specific crossbar information for the reset value of this register.

**NOTE**

On the MPC5744P, the reset value of these registers is 0x0320\_0010.

**17.2.2 Control Register (XBAR\_CRSn)**

These registers control several features of each slave port and must be accessed using 32-bit accesses. After CRSn[RO] is set, the PRSn can only be read; attempts to write to it have no effect and result in an error response.

**NOTE**

See the chip-specific crossbar information for the reset value of this register.

Not all HPEn fields may be active. See the chip-specific crossbar information for which masters support high priority elevation. Setting a field corresponding to a master that does not support high-priority elevation has no effect.

## Memory Map / Register Definition

Address: 0h base + 10h offset + (256d × i), where i=0d to 7d

## 17.3 Functional Description

### 17.3.1 General operation

When a master accesses the crossbar switch, the access is immediately taken. If the targeted slave port of the access is available, then the access is immediately presented on the slave port. Single-clock or zero-wait-state accesses are possible through the crossbar. If the targeted slave port of the access is busy or parked on a different master port, the requesting master simply sees wait states inserted until the targeted slave port can service the master's request. The latency in servicing the request depends on each master's priority level and the responding slave's access time.

Because the crossbar switch appears to be just another slave to the master device, the master device has no knowledge of whether it actually owns the slave port it is targeting. While the master does not have control of the slave port it is targeting, it simply waits.

A master is given control of the targeted slave port only after a previous access to a different slave port completes, regardless of its priority on the newly targeted slave port. This prevents deadlock from occurring when:

- A higher priority master has:
  - An outstanding request to one slave port that has a long response time and
  - A pending access to a different slave port, and
- A lower priority master is also making a request to the same slave port as the pending access of the higher priority master.

After the master has control of the slave port it is targeting, the master remains in control of the slave port until it relinquishes the slave port by running an IDLE cycle or by targeting a different slave port for its next access.

The master can also lose control of the slave port if another higher-priority master makes a request to the slave port. However, if the master is running a fixed-length burst transfer it retains control of the slave port until that transfer completes.

The crossbar terminates all master IDLE transfers, as opposed to allowing the termination to come from one of the slave buses. Additionally, when no master is requesting access to a slave port, the crossbar drives IDLE transfers onto the slave bus, even though a default master may be granted access to the slave port.

When a slave bus is being idled by the crossbar, it can park the slave port on the master port indicated by  $CRS_n[PARK]$ . This is done to save the initial clock of arbitration delay that otherwise would be seen if the same master had to arbitrate to gain control of the slave port. The slave port can also be put into Low Power Park mode to save power, by using  $CRS_n[PCTL]$ .

### 17.3.2 Register coherency

The operation of the crossbar is affected as soon as a register is written. The values of the registers do not track with slave-port-related master accesses, but instead track only with slave accesses.

### 17.3.3 Arbitration

The crossbar switch supports two arbitration algorithms:

- Fixed priority
- Round-robin

The arbitration scheme is independently programmable for each slave port.

#### 17.3.3.1 Fixed-priority operation

When operating in fixed-priority mode, each master is assigned a unique priority level in the priority registers ( $PRS_n$ ). If two masters request access to the same slave port, the master with the highest priority in the selected priority register gains control over the slave port.

#### NOTE

In this arbitration mode, a higher-priority master can monopolize a slave port, preventing accesses from any lower-priority master to the port.

When a master makes a request to a slave port, the slave port checks whether the new requesting master's priority level is higher than that of the master that currently has control over the slave port, unless the slave port is in a parked state. The slave port performs an arbitration check at every clock edge to ensure that the proper master, if any, has control of the slave port.

The following table describes possible scenarios based on the requesting master port:

**Table 17-1. How the Crossbar Switch grants control of a slave port to a master**

| When                                                                                                                                                                                                                                                           | Then the Crossbar Switch grants control to the requesting master                                                                                                                            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Both of the following are true: <ul style="list-style-type: none"> <li>The current master is running a fixed length burst transfer or a locked transfer.</li> <li>The requesting master's priority level is higher than that of the current master.</li> </ul> | At the end of the burst transfer or locked transfer                                                                                                                                         |
| The requesting master's priority level is lower than the current master.                                                                                                                                                                                       | At the conclusion of one of the following cycles: <ul style="list-style-type: none"> <li>An IDLE cycle</li> <li>A non-IDLE cycle to a location other than the current slave port</li> </ul> |

### 17.3.3.2 Round-robin priority operation

When operating in round-robin mode, each master is assigned a relative priority based on the master port number. This relative priority is compared to the master port number (ID) of the last master to perform a transfer on the slave bus. The highest priority requesting master becomes owner of the slave bus at the next transfer boundary, accounting for locked and fixed-length burst transfers. Priority is based on how far ahead the ID of the requesting master is to the ID of the last master.

After granted access to a slave port, a master may perform as many transfers as desired to that port until another master makes a request to the same slave port. The next master in line is granted access to the slave port at the next transfer boundary, or possibly on the next clock cycle if the current master has no pending access request.

As an example of arbitration in round-robin mode, assume the crossbar is implemented with master ports 0, 1, 4, and 5. If the last master of the slave port was master 1, and master 0, 4, and 5 make simultaneous requests, they are serviced in the order: 4 then 5 then 0.

Parking may continue to be used in a round-robin mode, but does not affect the round-robin pointer unless the parked master actually performs a transfer. Handoff occurs to the next master in line after one cycle of arbitration. If the slave port is put into low-power park mode, the round-robin pointer is reset to point at master port 0, giving it the highest priority.

### 17.3.3.3 Priority assignment

Each master port must be assigned a unique 3-bit priority level. If an attempt is made to program multiple master ports with the same priority level within the priority registers (PRSn), the crossbar switch responds with a bus error and the registers are not updated.

## 17.4 Initialization/application information

No initialization is required for the crossbar switch.

Hardware reset ensures all the register bits used by the crossbar switch are properly initialized to a valid state. However, settings and priorities may be programmed to achieve maximum system performance.

# Chapter 18

## Crossbar Integrity Checker (XBIC)

### 18.1 Overview

The Crossbar Integrity Checker (XBIC) verifies the integrity of the crossbar transfers.

### 18.2 Features

The XBIC has the following features:

- Verification of attribute information for all crossbar transfers
  - EDC (72,64) code protects against single and double bit errors
- Verification of feedback information for each data phase during crossbar transfer
- Error injection for testing
  - Programmable master and slave port specifiers
  - Programmable 8-bit toggle vector to insert error in master EDC checkbit value
  - Address, EDC syndrome, master and slave port information captured on error
- Programmable integrity check enable on a per-slave-port basis
- Programmable integrity feedback check enable on a per-master-port basis

### 18.3 Block diagram

The crossbar transfer attribute information for all master and slave ports is routed to the XBIC, which calculates and checks the EDC parity over the attribute information as shown in the following diagram.

Figure 18-1. XBIC system block diagram

## 18.4 External signal description

The XBIC has no external interface signals.

## 18.5 Memory map and register definition

The XBIC programming model has four 32-bit registers. The programming model can only be accessed in supervisor mode using 32-bit (word) accesses. Attempted references with a different access size, to an undefined (reserved) address, with a non-supported access type (a write to a read-only register), or in user mode generate an error termination.

### XBIC memory map

### 18.5.2 XBIC Error Injection Register (XBIC\_EIR)

The XBIC\_EIR contains fields for controlling the XBIC error injection function. When an error is injected, the EDC syndrome associated with the programmed master and slave ports is modified, causing the XBIC to assert the error indication to the FCCU and capturing the transfer information in the XBIC\_ESR and XBIC\_EAR registers. Otherwise, transfers are not affected by XBIC error injection.

| Field            | Description                                                                                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0<br>EIE         | Error Injection Enable.<br>0 Error injection disabled<br>1 Error injection enabled                                                                                                       |
| 1–16<br>Reserved | This field is reserved.<br>This read-only field is reserved and always has the value 0.                                                                                                  |
| 17–19<br>SLV     | Target Slave Port. Error injection is enabled for the designated slave port. Other slave ports are unaffected.                                                                           |
| 20–23<br>MST     | Target Master ID. Error injection is enabled for the designated master ID. Transfers with other master IDs are not affected.                                                             |
| 24–31<br>SYN     | Syndrome. This value is exclusive-ored with the calculated syndrome (which should be zero) to generate an error with the specified syndrome. A value of zero does not generate an error. |

### 18.5.3 XBIC Error Status Register (XBIC\_ESR)

The Error Status Register (XBIC\_ESR) contains two types of error information about the last transfer. If an attribute integrity check error was detected, the slave port, the master port, and the syndrome are captured in the SLV, MST, and SYN fields. If there is a mismatch among internal signals (hready, hresp0, and hresp2) during the data phase, the slave and master port are captured in the DPSE0-7 and DPME0-7 fields.

This register is cleared only on reset.

NOTE

When the XBIC detects back-to-back faults on a system bus path through the crossbar switch, the fault information captured in the XBIC\_ESR does not correspond to the initial fault event but rather the subsequent fault event. While the fault event is properly detected, diagnostic status information in the XBIC\_ESR register describing the initial fault event is lost. This can only occur in the event of a series of bus transactions targeting the same crossbar slave target where the series of bus transactions are not separated by idle or stall cycles.

| 16<br>DPME7  | Data phase master port error.<br>0 No error on master port 7<br>1 Data phase error on master port 7                                                                  |
| 17–19<br>SLV | Slave Port. The slave port targeted by the last transfer with an error.                                                                                              |
| 20–23<br>MST | Master ID. The master ID value of the last transfer with an error.                                                                                                   |
| 24–31<br>SYN | Syndrone. The syndrome calculated for the last transfer with an error. For single bit errors the signal in error can be determined, see <a href="#">Table 18-1</a> . |

**18.5.4 XBIC Error Address Register (XBIC\_EAR)**

The Error Address Register (XBIC\_EAR) contains the address of the first transfer in which an attribute integrity check error was detected on an enabled slave port. This register is only cleared on reset.

**NOTE**

When the XBIC detects back-to-back faults on a system bus path through the crossbar switch, the fault information captured in the XBIC\_EAR does not correspond to the initial fault event but rather the subsequent fault event. While the fault event is properly detected, diagnostic status information in the XBIC\_ESR register describing the initial fault event is lost. This can only occur in the event of a series of bus transactions targeting the same crossbar slave target where the series of bus transactions are not separated by idle or stall cycles.

Address: 0h base + Ch offset = Ch

|--------------|-------------------------------------------------|
| 0–31<br>ADDR | The address of the last transfer with an error. |

## 18.6 Functional description

The Crossbar Integrity Checker (XBIC) verifies the integrity of the crossbar interface. The Module Control Register (XBIC\_MCR) allows integrity checking to be enabled on a individual port basis. When an error is detected, it is captured in XBIC\_ESR register and XBIC also sends out an error signal to the Fault Collection and Control Unit (FCCU). Detection of an error does not generate a bus error. The XBIC integrity checking is independent from the end-to-end ECC that covers the transfer address and data.

During the AHB address phase, the crossbar attribute information is checked using an 8-bit Error Detection Code (EDC), which detects any single- or double-bit errors. When an error is detected, due either to hardware fault or error injection, information related to the error is captured and reported in XBIC\_ESR and XBIC\_EAR. The cause of a single-bit error can be determined by the syndrome value reported in the XBIC\_ESR as shown in [Table 18-1](#). Any other syndrome indicates a multi-bit error.

During the AHB data phase, the responding signals from the slave to master are checked when passing through the crossbar. When an error is detected, the information is captured in XBIC\_ESR DSME0-7 field.

The XBIC can also be programmed to intentionally inject EDC errors for testing. Error injection is targeted toward a single slave port and a single master ID at a time as determined by the settings in the Error Injection Register (XBIC\_EIR). When an error is injected, the EDC syndrome is modified which causes the XBIC to assert the error indication to the FCCU. Otherwise transfers are unaffected by XBIC error injection. This approach allows the check logic to be verified without compromising the integrity of the data transfer. Once the error injection function is enabled by setting XBIC\_EIR[EIE], errors are induced on all subsequent targeted transactions until XBIC\_EIR[EIE] is cleared

# Chapter 19

## Peripheral Bridge (AIPS-Lite)

### 19.1 Introduction

#### NOTE

For the chip-specific implementation details of this module's instances, see the chip configuration information.

The peripheral bridge converts the crossbar switch interface to an interface that can access most of the slave peripherals on this chip.

The peripheral bridge occupies 64 MB of the address space, which is divided into peripheral slots of 16 KB. (It might be possible that all the peripheral slots are not used. See the memory map chapter for details on slot assignments.) The bridge includes separate clock enable inputs for each of the slots to accommodate slower peripherals.

#### 19.1.1 Features

Key features of the peripheral bridge are:

- Supports peripheral slots with 8-, 16-, and 32-bit datapath width
- Supports a pair of 32-bit transactions for selected 64-bit memory accesses
- Programming model provides memory protection functionality

#### 19.1.2 General operation

The slave devices connected to the peripheral bridge are modules which contain a programming model of control and status registers. The system masters read and write these registers through the peripheral bridge.

The register maps of the peripherals are located on 16 KB boundaries. Each peripheral is allocated one or more 16-KB block(s) of the memory map.

## 19.2 Memory map/register definition

The 32-bit peripheral bridge registers can be accessed only in supervisor mode by trusted bus masters. Additionally, these registers must be read from or written to only by a 32-bit aligned access. The peripheral bridge registers are mapped into the Peripheral Access Control Register A PACRA[PACR0] address space.

19.2.1 Master Privilege Register A (AIPS\_MPRA)

This register specifies eight identical 4-bit fields defining the access-privilege level associated with a bus master in the device to various peripherals. The register provides one field per bus master. Each master is assigned a logical master number. See the device configuration information for details.

Address: 0h base + 0h offset = 0h

**19.2.2 Peripheral Access Control Register (AIPS\_PACR<sub>n</sub>)**

Each of the on-platform peripherals has a 4-bit PACR *n* field, which defines the access levels supported by the given module. Eight PACR fields are grouped together to form a 32-bit PACR *x* register.

The peripheral assignments to each PACR are defined by the memory map slot that the peripherals are assigned. See the device's memory map details for the assignments for a particular device. If a peripheral is absent, the corresponding PACR field is not implemented. Reads to the location return zeroes and writes are ignored.

The following table shows the top-level structure of PACRs.

| Offset | Register | [0:3]  | [4:7]  | [8:11] | [12:15] | [16:19] | [20:23] | [24:27] | [28:31] |
|--------|----------|--------|--------|--------|---------|---------|---------|---------|---------|
| 0x100  | PACRA    | PACR0  | PACR1  | PACR2  | PACR3   | PACR4   | PACR5   | PACR6   | PACR7   |
| 0x104  | PACRB    | PACR8  | PACR9  | PACR10 | PACR11  | PACR12  | PACR13  | PACR14  | PACR15  |

### 19.2.3 Off-Platform Peripheral Access Control Register (AIPS\_OPACR<sub>n</sub>)

Each of the peripherals has a 4-bit OPACR  $n$  field, which defines the access levels supported by this module. Eight OPACR fields are grouped together to form a 32-bit OPACR  $x$  register.

The peripheral assignments to each OPACR are defined by the memory map slot that the peripherals are assigned. See the device's memory map details for the assignments for a particular device. If a peripheral is absent, the corresponding OPACR field is not implemented. Reads to the location return zeroes and writes are ignored.

The following table shows the top-level structure of OPACRs.

**Memory map/register definition**

| Offset | Register | [0:3]    | [4:7]    | [8:11]   | [12:15]  | [16:19]  | [20:23]  | [24:27]  | [28:31]  |

## 19.3 Functional description

The peripheral bridge functions as a bus protocol translator between the crossbar switch and the slave peripheral bus.

Support is provided for generating a pair of 32-bit slave accesses when performing certain 64-bit peripheral accesses.

The peripheral bridge manages all transactions destined for the attached slave devices and generates select signals for modules on the peripheral bus by decoding accesses within the attached address space.

### 19.3.1 Access support

Aligned and misaligned 32-bit, 16-bit, and byte accesses are supported for 32-bit peripherals. Misaligned accesses are supported to allow memory to be placed on the slave peripheral bus. Peripheral registers must not be misaligned, although no explicit checking

## Functional description

is performed by the peripheral bridge. The peripheral bridge performs two slave peripheral bus transfers for allowed 64-bit transactions, to 32-bit sized peripheral slots only. All other accesses are performed with a single transfer.

All accesses to the peripheral slots must be sized less than or equal to the designated peripheral slot size. If an access is attempted that is larger than the targeted port, an error response is generated.

## Chapter 20

# System Memory Protection Unit (SMPU)

### 20.1 Overview

#### NOTE

For the chip-specific implementation details of this module's instances, see the chip configuration information.

The System Memory Protection Unit (SMPU) provides hardware access control for system bus memory references. The SMPU concurrently monitors system bus transactions and evaluates their appropriateness using preprogrammed region descriptors that define memory spaces and their access rights. Memory references that have sufficient access control rights are allowed to complete, while references that are not mapped to any region descriptor or have insufficient rights are terminated with an access error response.

#### 20.1.1 Block diagram

A simplified block diagram of the SMPU module is shown in the following figure. The access signals coming from the crossbar switch slave ports are shown on the left. The access evaluation macros and region descriptors are in the middle, and the peripheral bus interface is on the right side.

**Figure 20-1. SMPU block diagram**

The access evaluation macros determine hits to memory regions and detect violations to access protections. If a violation is detected, the macros update the appropriate master's error registers. For details of the access evaluation macro, see [Access evaluation macro](#).

## 20.1.2 Features

The SMPU feature set includes:

- Arbitrarily sized protection regions alignable anywhere in memory.
  - Region sizes can vary from a minimum of 1 byte to a maximum of 4 GB.
- Read/write access control permissions are defined in the region descriptor.
- Global cache-inhibit attribute indicator.
- Hardware-assisted maintenance of the descriptor valid bit minimizes coherency issues.
- Priority given to granting permission over denying access for overlapping region descriptors.

- Detection of access errors if a memory reference does not hit in any memory region, or if the reference is illegal in all hit memory regions. If an access error occurs, the reference is terminated with an error response, and the SMPU inhibits the bus cycle being sent to the targeted slave device.
- Instruction storage (ISI) or data storage (DSI) interrupts generated by aborted core accesses. Buffered writes generate Machine check exception (refer to the documentation related to the core for details).
- Error registers (per bus master ID) capture the last faulting address, attributes, and other information.
- Global SMPU enable/disable control bit.

## 20.2 Memory map/register definition

The programming model is partitioned into three groups:

- Control registers
- Error capture registers
- Data structure containing the region descriptors

The programming model can be referenced only in supervisor mode using 32-bit accesses. Attempted references with a different access size, to an undefined (reserved) address, with a non-supported access type (a write to a read-only register, or a read of a write-only register), or in user mode generate an error termination.

### NOTE

See the chip configuration details for any chip-specific register information for this module. For example, a specific instance of the module may support only eight or fewer region descriptors.

### SMPU memory map

**20.2.3 Error Address Register, Bus Master n (SMPU\_EAR<sub>n</sub>)**

When the SMPU detects an access error on bus master n, the 32-bit reference address is captured in this read-only register and the corresponding bit in CESR0[MERR] set. Additional information about the faulting access is captured in the corresponding EDR<sub>n</sub> at the same time.<sup>1</sup>

Address: 0h base + 100h offset + (8d × i), where i=0d to 15d

| Field         | Description                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------|
| 0–31<br>EADDR | Error address<br><br>Indicates the reference address from bus master n that generated the access error. |

1. The corresponding EAR<sub>n</sub> and EDR<sub>n</sub> registers contain information on the original access error; subsequent errors associated with the given master are recorded as overruns in the CESR1[MEOVR] field until the CESR0[MERR] flag associated with the original error is cleared (by writing a 1).

## 20.2.4 Error Detail Register, Bus Master n (SMPU\_EDRn)

When the SMPU detects an access error associated with bus master n, 32 bits of error detail are captured in this read-only register and the corresponding bit in CESR0[MERR] is set. Information on the faulting address is captured in the corresponding EARN register at the same time. <sup>2</sup>

*Table continues on the next page...*

2. The corresponding EARN and EDRn registers contain information on the original access error; subsequent errors associated with the given master are recorded as overruns in the CESR1[MEOVR] field until the CESR0[MERR] flag associated with the original error is cleared (by writing a 1).

|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| 0–31<br>ENDADDR | End address<br>Defines the byte end address of the memory region.<br><b>NOTE:</b> The SMPU does not verify that ENDADDR ≥ SRTADDR. |

**20.2.7 Region Descriptor n, Word 2 (SMPU\_RGDn\_WORD2)**

RGD\_WORD2 defines the access control rights of the memory region. The access control rights are defined by separate read and write permissions. For these fields, the bus master number refers to the *logical* bus master number.

For the access control rights, there are two flags:

- Read (r) permission refers to the ability to access the referenced memory address using an operand (data) fetch or an instruction fetch.
- Write (w) permission refers to the ability to update the referenced memory address using a store (data) operation.

Each field consists of the two flags, with (r) being in the more significant position. For example, M0P has (r) as bit 0 and (w) as bit 1.

The bit settings are as follows:

- If set, the corresponding flag allows the specific access type (r = memory read, w = memory write).
- If cleared, the specific access type is not allowed.

Writes to this word clear the region descriptor's valid bit.

Address: 0h base + 408h offset + (16d × i), where i=0d to 15d

|       |     |   |     |   |     |   |     |   |     |   |     |    |     |    |     |    |

## 20.3 Functional description

In this section, the functional operation of the SMPU is detailed, including the operation of the access evaluation macro and the handling of error-terminated bus cycles.

### 20.3.1 Access evaluation macro

The basic operation of the SMPU is performed in the access evaluation macro, a hardware structure replicated in the connection matrix. The following block diagram represents an individual macro.

**Figure 20-2. SMPU access evaluation macro**

Each macro uses the information contained in the access signals (the address, the access type, and the master's ID and privilege level) and the contents of its corresponding region descriptor (RGD $n$ ) to perform two major functions: [Hit determination](#) and [Violation determination](#). The individual hit and error results from each macro are then combined for a final evaluation; see [Final evaluation and error terminations](#).

#### 20.3.1.1 Hit determination

To determine if the current reference hits in the given region, two magnitude comparators are used with the region's start and end addresses. When RGD $n$ \_Word3[VLD] is 1, a region hit occurs when the requested address is between the start address (RGD $n$ \_Word0[SRTADDR]) and the end address (RGD $n$ \_Word1[ENDADDR]), inclusive.

**NOTE**

If  $\text{ENDADDR} < \text{SRTADDR}$ , no hit occurs.

**NOTE**

Region hit determination is based only on an address comparison of the first byte being accessed; that is, the SMPU does not check the size of the access to make sure it fits within an allowed region.

### 20.3.1.2 Violation determination

While the access evaluation macro is determining region hit, the logic is also evaluating if the current access is allowed by the permissions defined in the region descriptor. Using the master ID, a set of effective permissions is generated from the appropriate fields in the region descriptor. The protection violation logic then evaluates the access against the effective permissions using the specification shown below.

**Table 20-1. Protection violation definition**

| Access type            | Access permissions |   | Protection violation?      |
|------------------------|--------------------|---|----------------------------|
|                        | r                  | w |                            |
| Instruction fetch read | 0                  | — | Yes, no execute permission |
|                        | 1                  | — | No, access is allowed      |
| Data read              | 0                  | — | Yes, no read permission    |
|                        | 1                  | — | No, access is allowed      |
| Data write             | —                  | 0 | Yes, no write permission   |
|                        | —                  | 1 | No, access is allowed      |

### 20.3.2 Final evaluation and error terminations

For each slave port monitored, the SMPU performs a reduction-AND of all the individual terms from each access evaluation macro. This expression then terminates the bus cycle with an error and reports an access error for three conditions:

1. The access does not hit in any region descriptor.
2. The access hits in a single region descriptor and that region has a protection violation.

3. The access hits in multiple (overlapping) regions and all regions have protection violations.

As shown in the third condition, granting permission is a higher priority than denying access for overlapping regions. This approach is more flexible to system software in region descriptor assignments. For an example of the use of overlapping region descriptors, see [Application information](#).

### **NOTE**

Similarly, the cache inhibit function gives a higher priority to the less restrictive result of overlapping regions. If two regions are hit and one has cache inhibit set, and the other does not, the result will not include a cache inhibit. It should also be noted that only the hit logic is taken into account for cache inhibit. For example, two region hits, one has protection violation and no cache inhibit, one has no violation and cache inhibit set. The result will be a granted access with no cache inhibit.

## **20.3.3 Power management**

Disabling the SMPU by clearing CESR0[GVLD] minimizes power dissipation. To minimize the power dissipation of an enabled SMPU, invalidate unused region descriptors by clearing the associated RGDn\_Word3[VLD] bits.

## **20.4 Initialization information**

At system startup, load the appropriate number of region descriptors, including setting RGDn\_Word3[VLD]. Setting CESR0[GVLD] enables the module.

If the system requires that all the loaded region descriptors be enabled simultaneously, first ensure that the entire SMPU is disabled (CESR0[GVLD]=0). Next, load the appropriate region descriptors (RGDn), including the setting of the RGDn\_Word3[VLD] bits. Finally, set CESR0[GVLD] to enable the entire module.

### **Note**

A region descriptor must be set to allow access to the SMPU registers if further changes are needed.

## 20.5 Application information

In an operational system, interfacing with the SMPU is generally classified into the following activities:

- Creating a new memory region

Load the appropriate region descriptor into an available  $\text{RGD}_n$ , using four sequential 32-bit writes. The hardware assists in the maintenance of the valid bit, so if this approach is followed, there are no coherency issues with the multi-cycle descriptor writes.

- Modifying a region descriptor

Load the updates into the region descriptor using sequential 32-bit writes. Writing to Word 3 re-enables the region descriptor valid bit. The hardware assists in the maintenance of the valid bit, so if this approach is followed, there are no coherency issues with the multi-cycle descriptor writes.

- Removing a region descriptor

Clearing  $\text{RGD}_n\_ \text{Word3}[\text{VLD}]$  deletes an existing region descriptor.

- Accessing the SMPU

Allocate a region descriptor to restrict SMPU access to supervisor mode from specific masters as appropriate.

- Detecting an access error

The current bus cycle is terminated with an error response and  $\text{EAR}_n$  and  $\text{EDR}_n$  capture information on the faulting reference. The error-terminated bus cycle typically initiates an error response in the originating bus master. For example, a processor core may respond with a bus error exception, while a data movement bus master may respond with an error interrupt. The processor can retrieve the captured error address and detail information simply by reading  $\text{E}\{\text{A},\text{D}\}\text{R}_n$ .  $\text{CESR0}[\text{MERR}]$  signals which error registers contain captured fault data. Once the error information is retrieved, write a 1 to the appropriate  $\text{CESR0}[\text{MERR}]$  bit to clear it, thereby rearming the error capture logic associated with the  $\text{EAR}_n$  and  $\text{EDR}_n$  registers.

- Overlapping region descriptors

Applying overlapping regions often reduces the number of descriptors required for a given set of access controls. In the overlapping memory space, the protection rights of the corresponding region descriptors are logically summed together (the boolean OR operator).

# Chapter 21

## Interrupt Controller (INTC)

### 21.1 Introduction

#### NOTE

For the chip-specific implementation details of this module's instances, see the chip configuration information.

The INTC:

- Provides priority-based preemptive scheduling of interrupt requests
- Schedules interrupt requests (IRQs) from software and internal peripherals to one or more processors (PRCs)
- Provides interrupt prioritization and preemption, interrupt masking, interrupt priority elevation, and protocol support

This scheduling scheme is suitable for statically scheduled hard real-time systems.

The INTC is targeted to work with a Power Architecture processor and is capable of processing high-demand interrupt sources where the Interrupt Service Routines (ISRs) nest to multiple levels, but it also can be used with other processors and applications.

For high-priority interrupt requests in these target applications, it is necessary to minimize the interval between the assertion of the interrupt request from the peripheral and the point at which the processor is performing useful work to service the interrupt request. The INTC supports this goal by providing a unique vector for each interrupt request source. It also provides 32 priorities so that lower priority ISRs do not delay the execution of higher priority ISRs. Since each individual application will have different priorities for each source of interrupt request, the priority of each interrupt request is configurable.

When multiple tasks share a resource, coherent accesses to that resource need to be supported. The INTC supports the Priority Ceiling Protocol for coherent accesses. By providing a modifiable priority mask, the priority can be raised temporarily so that all tasks which share the resource are unable to preempt each other.

Multiple processors can assert interrupt requests to each other through software-settable interrupt requests. These same software-settable interrupt requests can also be used to separate the work involved in servicing an interrupt request into two parts, a high-priority portion and a low-priority portion. The high-priority portion is initiated by a peripheral interrupt request, but then the ISR can assert a software-settable interrupt request to finish the servicing in a lower priority ISR. Therefore these software-settable interrupt requests can be used instead of having the peripheral ISR schedule a task through the RTOS.

## **21.2 Block diagram**

The following figure shows the block diagram of an INTC with four processors (PRC0...PRC3). The actual number of processors is described in the chip-specific INTC information. The structure of the INTC remains the same for each implemented processor.

Figure 21-1. Block diagram for an INTC with four processors

## 21.3 Features

- Each peripheral interrupt source is software-steerable to any combination of interrupt request outputs to the following:
  - Processor 0
- 16 software-settable interrupt request sources
- 10-bit vector

- Unique vector for each interrupt request source
- Hardware connection to processor or read from register
- Each interrupt source can be programmed to one of 32 priorities
- Each interrupt source can be triggered by software
- Preemption
  - Preemptive prioritized interrupt requests to processor
  - ISR with higher priority preempts ISRs or tasks with lower priorities
  - Automatic pushing or popping of preempted priority to or from a LIFO
  - Ability to modify the ISR or task priority; modifying the priority can be used to implement the Priority Ceiling Protocol for accessing shared resources
  - 3 INTC clock cycles from interrupt request into interrupt request to CPU
- Low latency
  - 3 INTC clock cycles from receipt of interrupt request from peripheral to interrupt request to processor; four clock cycles from receipt of software request
- Monitor
  - The Interrupt Controller Monitor (INTCM) provides a way to set a maximum timer count for the interrupt latency from interrupt request (IRQ) to interrupt acknowledge (IACK) or from IRQ to return from interrupt (RFI). The purpose of this function is to provide a mechanism to monitor the latency of interrupt sources for a corresponding Processor to ensure that these critical interrupts execute within the expected window of time, increasing the reliability of the device. The hardware for this function is isolated in its own hierarchy to decrease the risk of fault interference.

## 21.4 Modes of operation

The interrupt controller has two handshaking modes with the processor: software vector mode and hardware vector mode. The state of the hardware vector enable bit, `INTC_BCR[HVEN]`, determines which mode is used. In Power Architecture devices, software vector mode uses the autovector mode of the Processor for a single entry point for the ISR (16 bytes of vector space available), whereas the hardware vector mode uses the non-autovector mode where the vector offset from the INTC is provided to the Processor (4 bytes for each IRQ).

In debug mode the interrupt controller operation is identical to its normal operation of software vector mode or hardware vector mode.

### 21.4.1 Software vector mode

In software vector mode, software (that is, the interrupt exception handler) must read a register in the INTC to obtain the vector associated with the interrupt request to the processor. The INTC will use software vector mode for a given processor when its associated HVEN\_PRCn bit in the INTC\_BCR is negated. The hardware vector enable signal to any processor is driven as negated when its associated HVEN\_PRCn bit is negated. The vector is read from the INTC\_IACKRn registers. Reading the INTC\_IACKRn negates the interrupt request to the associated processor. Even if a higher priority interrupt request has arrived while waiting for this interrupt acknowledge, the interrupt request to the processor will negate for at least one clock. The reading also pushes the PRI value in the INTC\_CPRn onto the associated LIFO, and updates PRI in the associated INTC\_CPR\_PRCn with the new priority.

### 21.4.2 Hardware vector mode

In hardware vector mode, the hardware causes the first instruction that will be executed (when handling the interrupt request to the processor) to be an instruction that is specific to that vector. Therefore the interrupt exception handler is specific to a peripheral or software-settable interrupt request, rather than being common to all of them. The INTC will use hardware vector mode for a given processor when its associated HVENn bit in the INTC\_BCR is asserted. The hardware vector enable signal to the associated processor is driven as asserted.

When the interrupt request to the associated processor asserts, the interrupt vector signal is updated. The value of that interrupt vector is the unique vector associated with the preempting peripheral or software-settable interrupt request. The vector value matches the value of the INTVEC field in the INTC\_IACKRn, depending on which processor was assigned to handle a given interrupt source.

The assertion of the interrupt acknowledge signal for a given processor pushes the associated PRI value in the associated INTC\_CPRn register onto the associated LIFO and updates the associated PRI in the associated INTC\_CPRn register with the new priority. This pushing of the PRI value onto the associated LIFO and updating PRI in the associated INTC\_CPRn does not occur when the associated interrupt acknowledge signal asserts and the INTC\_SSCIRs is written at a time such that the PRI value in the associated INTC\_CPRn register would need to be pushed and the previously last pushed

PRI value would need to be popped simultaneously. In this case, PRI in the associated INTC\_CPR $n$  is updated with the new priority, and the associated LIFO is neither pushed or popped.

## 21.5 Memory map and register definition

A transfer error will be asserted if an access is attempted outside of the memory map or for any unimplemented registers. For example, if the design has only 512 interrupt sources and a source > 512 is accessed, a transfer error is asserted.

With the exception of the INTC\_SSCIR  $n$  and INTC\_PSR  $n$  registers, all of the registers are 32-bit. Any combination of accessing the four bytes of a register with a single access is supported, provided that the access does not cross a register boundary. These supported accesses include types and sizes of 8 bits, aligned 16 bits, misaligned 16 bits to the middle two bytes, and aligned 32 bits.

Although INTC\_SSCIR $n$  are 8 bits wide and INTC\_PSR $n$  are 16 bits wide, they can be accessed with a single 16-bit or 32-bit access, provided that the access does not cross a 32-bit boundary.

Some registers have specific exceptions to these rules, as outlined in their definitions. When writing to INTC\_PSRs or INTC\_SSCIRs, the following restrictions (illustrated in Figure 21-2) apply:

- For PSRs, write accesses must not span 16-bit boundaries where one register is implemented and one is unimplemented (unimplemented interrupt source).
- For SSCIRs, write accesses must not span 8-bit boundaries where one register is implemented and one is unimplemented (unimplemented interrupt source).

Figure 21-2. INTC\_PSR $n$  and INTC\_SSCIR $n$  write restrictions

In software vector mode, the effects of a read of the INTC Interrupt Acknowledge register (INTC\_IACKR *n*) are the same regardless of the size of the read. In either software or hardware vector mode, the size of a write to the INTC end-of-interrupt register (INTC\_EOIR *n*) does not affect the operation of the write.

### INTC memory map

| Address offset (hex) | Register name                                                     | Width (in bits) | Access | Reset value | Section/page               |
|----------------------|-------------------------------------------------------------------|-----------------|--------|-------------|----------------------------|
