64 Mbit (x16) Advanced Multi-Purpose Flash Plus

SST38VF6401 / SST38VF6402 / SST38VF6403 / SST38VF6404

Not Recommended for New Designs

The SST38VF6401/6402/6403/6404 are 4M x16 CMOS Advanced Multi-Purpose Flash Plus (Advanced MPF+) devices manufactured with proprietary, high-performance CMOS Super- Flash technology. The split-gate cell design and thick-oxide tunneling injector attain better reliability and manufacturability compared with alternate approaches. The SST38VF6401/6402/6403/6404 write (Program or Erase) with a 2.7-3.6V power supply. This device conforms to JEDEC standard pin assignments for x16 memories.

Features

- **Organized as 4M x16**
- **Single Voltage Read and Write Operations**
  - 2.7-3.6V
- **Superior Reliability**
  - Endurance: 100,000 Cycles minimum
  - Greater than 100 years Data Retention3
- **Low Power Consumption (typical values at 5 MHz)**
  - Active Current: 4 mA (typical)
  - Standby Current: 3 µA (typical)
  - Auto Low Power Mode: 3 µA (typical)
- **128-bit Unique ID**
- **Security-ID Feature**
  - 256 Word, user One-Time-Programmable
- **Protection and Security Features**
  - Hardware Boot Block Protection/WP# Input Pin, Uniform (32 KWord) and Non-Uniform (8 KWord) options available
  - User-controlled individual block (32 KWord) protection, using software only methods
  - Password protection
- **Hardware Reset Pin (RST#)**
- **Fast Read and Page Read Access Times:**
  - 90 ns Read access time
  - 25 ns Page Read access times
    - 4-Word Page Read buffer
- **Latched Address and Data**
- **Fast Erase Times:**
  - Sector-Erase Time: 18 ms (typical)
  - Block-Erase Time: 18 ms (typical)
  - Chip-Erase Time: 40 ms (typical)
- **Erase-Suspend/-Resume Capabilities**
- **Fast Word and Write-Buffer Programming Times:**
  - Word-Program Time: 7 µs (typical)
  - Write Buffer Programming Time: 1.75 µs / Word (typical)
    - 16-Word Write Buffer
- **Automatic Write Timing**
  - Internal V_{PP} Generation
- **End-of-Write Detection**
  - Toggle Bits
  - Data# Polling
  - RY/BY# Output
- **CMOS I/O Compatibility**
- **JEDEC Standard**
  - Flash EEPROM Pinouts and command sets
- **CFI Compliant**
- **Packages Available**
  - 48-lead TSOP
  - 48-ball TFBGA
- **All devices are RoHS compliant**

Not Recommended for New Designs

Product Description

The SST38VF6401, SST38VF6402, SST38VF6403, and SST38VF6404 devices are 4M x16 CMOS Advanced Multi-Purpose Flash Plus (Advanced MPF+) manufactured with proprietary, high-performance CMOS SuperFlash technology. The split-gate cell design and thick-oxide tunneling injector attain better reliability and manufacturability compared with alternate approaches. The SST38VF6401/6402/6403/6404 write (Program or Erase) with a 2.7-3.6V power supply. These devices conform to JEDEC standard pin assignments for x16 memories.

Featuring high performance Word-Program, the SST38VF6401/6402/6403/6404 provide a typical Word-Program time of 7 µsec. For faster word-programming performance, the Write-Buffer Programming feature, has a typical word-program time of 1.75 µsec. These devices use Toggle Bit or Data# Polling to indicate Program operation completion. In addition to single-word Read, Advanced MPF+ devices provide a Page-Read feature that enables a faster word read time of 25 ns, for words on the same page.

To protect against inadvertent write, the SST38VF6401/6402/6403/6404 have on-chip hardware and Software Data Protection schemes. Designed, manufactured, and tested for a wide spectrum of applications, these devices are available with 100,000 cycles minimum endurance. Data retention is rated at greater than 100 years.

The SST38VF6401/6402/6403/6404 are suited for applications that require the convenient and economical updating of program, configuration, or data memory. For all system applications, Advanced MPF+ significantly improve performance and reliability, while lowering power consumption. These devices inherently use less energy during Erase and Program than alternative flash technologies. The total energy consumed is a function of the applied voltage, current, and time of application. For any given voltage range, the SuperFlash technology uses less current to program and has a shorter erase time; therefore, the total energy consumed during any Erase or Program operation is less than alternative flash technologies.

These devices also improve flexibility while lowering the cost for program, data, and configuration storage applications. The SuperFlash technology provides fixed Erase and Program times, independent of the number of Erase/Program cycles that have occurred. Therefore, the system software or hardware does not have to be modified or de-rated as is necessary with alternative flash technologies, whose Erase and Program times increase with accumulated Erase/Program cycles.

The SST38VF6401/6402/6403/6404 also offer flexible data protection features. Applications that require memory protection from program and erase operations can use the Boot Block, Individual Block Protection, and Advanced Protection features. For applications that require a permanent solution, the Irreversible Block Locking feature provides permanent protection for memory blocks.

To meet high-density, surface mount requirements, the SST38VF6401/6402/6403/6404 devices are offered in 48-lead TSOP and 48-ball TFBGA packages. See Figures 2 and 3 for pin assignments and Table 1 for pin descriptions.

Pin Assignments

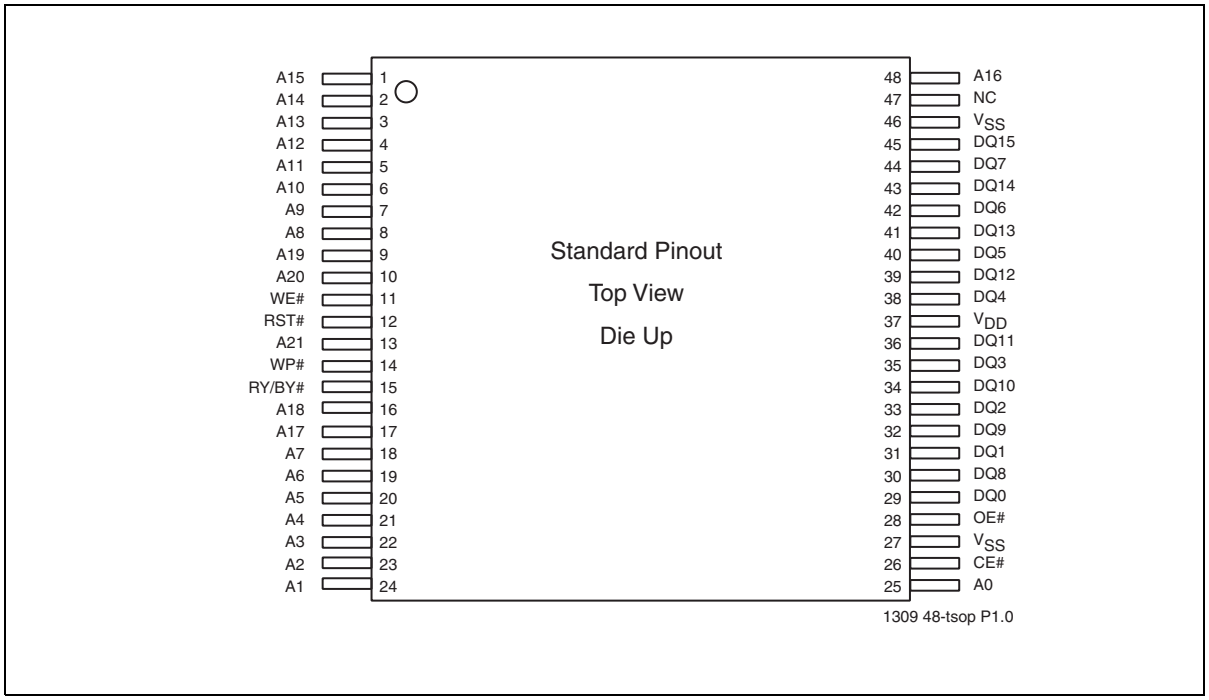

Figure 2: Pin Assignments for 48-lead TSOP

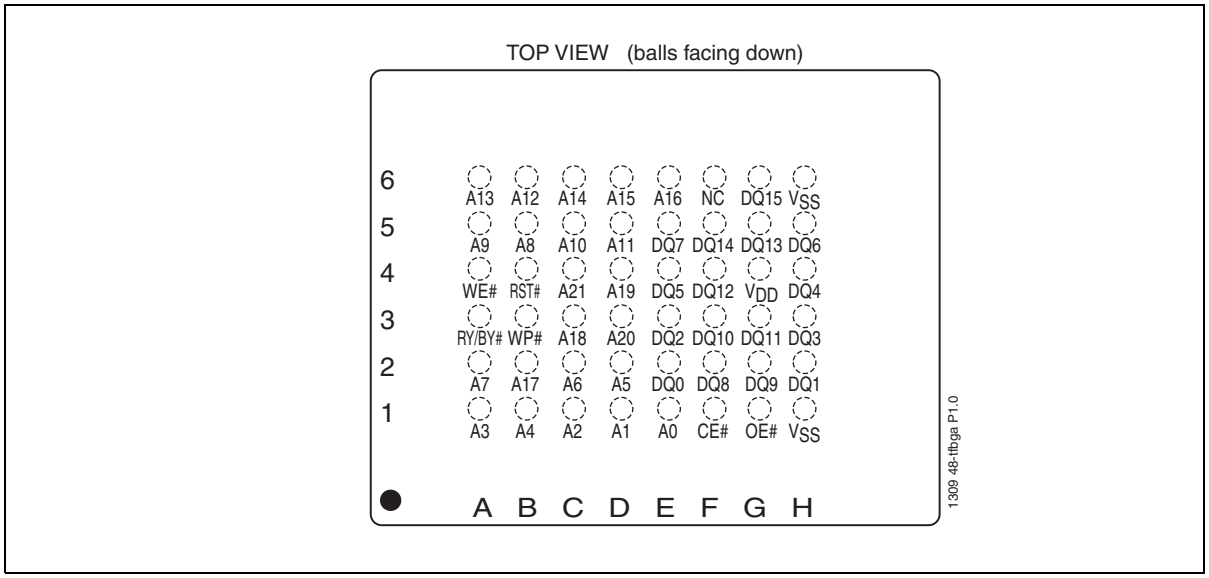

Figure 3: Pin assignments for 48-ball TFBGA

Table 1: Pin Description

Symbol	Pin Name	Functions
A_{MS}[1]-A_0	Address Inputs	To provide memory addresses. During Sector-Erase A_{MS}-A_{12} address lines will select the sector. During Block-Erase A_{MS}-A_{15} address lines will select the block.
DQ_{15}-DQ_0	Data Input/output	To output data during Read cycles and receive input data during Write cycles. Data is internally latched during a Write cycle. The outputs are in tri-state when OE# or CE# is high.
WP#	Write Protect	To protect the top/bottom boot block from Erase/Program operation when grounded.
RY/BY#	Ready/Busy	To indicate when the device is actively programming or erasing.
RST#	Reset	To reset and return the device to Read mode.
CE#	Chip Enable	To activate the device when CE# is low.
OE#	Output Enable	To gate the data output buffers.
WE#	Write Enable	To control the Write operations.
V_{DD}	Power Supply	To provide power supply voltage: 2.7-3.6V
V_{SS}	Ground	
NC	No Connection	Unconnected pins.

1. Each block, B0-B127 is 32KWord.
2. Each block consists of eight sectors.
3. Each sector, S0-S1023 is 4KWord.
4. X = 0 or 1. Block Address (BA) = A_{21} - A_{15}; Sector Address (SA) = A_{21} - A_{12}
5. Each block has an associated VPB and NVPB, except for some blocks in SST39VF6403 and SST39VF6404.
   In SST39VF6403, Block B0 does not have a single VPB or NVPB for all 32 KWords. Instead, each sector (4 KWord) in Block B0 has its own VPB and NVPB.
   In SST39VF6404, Block B127 does not have a single VPB or NVPB for all 32 KWords. Instead, each sector (4 KWord) in Block B127 has its own VPB and NVPB.
6. The 8KWord boot block consists of S0 and S1 in Block B0.
7. The 8KWord boot block consists of S1022 and S1023 in Block B127.

Device Operation

The memory operations functions of these devices are initiated using commands written to the device using standard microprocessor Write sequences. A command is written by asserting WE# low while keeping CE# low. The address bus is latched on the falling edge of WE# or CE#, whichever occurs last. The data bus is latched on the rising edge of WE# or CE#, whichever occurs first.

The SST38VF6401/6402/6403/6404 also have the Auto Low Power mode which puts the device in a near-standby mode after data has been accessed with a valid Read operation. This reduces the I_{DD} active read current from typically 4 mA to typically 3 µA. The Auto Low Power mode reduces the typical I_{DD} active read current to the range of 2 mA/MHz of Read cycle time. The device requires no access time to exit the Auto Low Power mode after any address transition or control signal transition used to initiate another Read cycle. The device does not enter Auto-Low Power mode after power-up with CE# held steadily low, until the first address transition or CE# is driven high.

Read

The Read operation of the SST38VF6401/6402/6403/6404 is controlled by CE# and OE#, both of which have to be low for the system to obtain data from the outputs. CE# is used for device selection. When CE# is high, the chip is deselected and only standby power is consumed. OE# is the output control and is used to gate data from the output pins. The data bus is in high impedance state when either CE# or OE# is high. Refer to Figure 5, the Read cycle timing diagram, for further details.

Page Read

The Page Read operation utilizes an asynchronous method that enables the system to read data from the SST38VF6401/6402/6403/6404 at a faster rate. This operation allows users to read a four-word page of data at an average speed of 41.25 ns per word.

In Page Read, the initial word read from the page requires T_{ACC} to be valid, while the remaining three words in the page require only T_{PACC}. All four words in the page have the same address bits, A_{21}-A_2, which are used to select the page. Address bits A_1 and A_0 are toggled, in any order, to read the words within the page.

The Page Read operation of the SST38VF6401/6402/6403/6404 is controlled by CE# and OE#. Both CE# and OE# must be low for the system to obtain data from the output pins. CE# controls device selection. When CE# is high, the chip is deselected and only standby power is consumed. OE# is the output control and is used to gate data from the output pins. The data bus is in high impedance state when either CE# or OE# is high. Refer to Figure 6, the Page Read cycle timing diagram, for further details.

Word-Program Operation

The SST38VF6401/6402/6403/6404 can be programmed on a word-by-word basis. Before programming, the sector where the word exists must be fully erased. The Program operation is accomplished in three steps. The first step is the three-byte load sequence for Software Data Protection. The second step is to load word address and word data. During the Word-Program operation, the addresses are latched on the falling edge of either CE# or WE#, whichever occurs last. The data is latched on the rising edge of either CE# or WE#, whichever occurs first. The third step is the internal Program operation which is initiated after the rising edge of the fourth WE# or CE#, whichever occurs first. The Program operation, once initiated, will be completed within 10 µs. See Figures 7 and 8 for WE# and CE# controlled Program operation timing diagrams and Figure 24 for flowcharts.

During the Program operation, the only valid reads are Data# Polling, Toggle Bits, and RY/BY#. During the internal Program operation, the host is free to perform additional tasks. Any commands issued during the internal Program operation are ignored. During the command sequence, WP# should be statically held high or low.

When programming more than a few words, Microchip recommends Write-Buffer Programming.

Write-Buffer Programming

The SST38VF6401/6402/6403/6404 offer Write-Buffer Programming, a feature that enables faster effective word programming. To use this feature, write up to 16 words with the Write-to-Buffer command, then use the Program Buffer-to-Flash command to program the Write-Buffer to memory.

The Write-to-Buffer command consists of between 5 and 20 write cycles. The total number of write cycles in the Write-to-Buffer command sequence is equal to the number of words to be written to the buffer plus four.

The first three cycles in the command sequence tell the device that a Write-to-Buffer operation will begin.

The fourth cycle tells the device the number of words to be written into the buffer and the block address of these words. Specifically, the write cycle consists of a block address and a data value called the Word Count (WC), which is the number of words to be written to the buffer minus one. If the WC is greater than 15, the maximum buffer size minus 1, then the operation aborts.

For the fifth cycle, and all subsequent cycles of the Write-to-Buffer command, the command sequence consists of the addresses and data of the words to be written into the buffer. All of these cycles must have the same A_{21} - A_4 address, otherwise the operation aborts. The number of Write cycles required is equal to the number of words to be written into the Write-Buffer, which is equal to WC plus one. The correct number of Write cycles must be issued or the operation will abort. Each Write cycle decrements the Write-Buffer counter, even if two or more of the Write cycles have identical address values. Only the final data loaded for each buffer location is held in the Write-Buffer.

Once the Write-to-Buffer command sequence is completed, the Program Buffer-to-Flash command should be issued to program the Write-Buffer contents to the specified block in memory. The block address (i.e. A_{21} - A_{15}) in this command must match the block address in the 4th write cycle of the Write-to-Buffer command or the operation aborts. See Table 11 for details on Write-to-Buffer and Program-Buffer-to-Flash commands.

While issuing these command sequences, the Write-Buffer Programming Abort detection bit (DQ1) indicates if the operation has aborted. There are several cases in which the device can abort:

- In the fourth write cycle of the Write-to-Buffer command, if the WC is greater than 15, the operation aborts.
- In the fifth and all subsequent cycles of the Write-to-Buffer command, if the address values, A_{21} - A_4, are not identical, the operation aborts.
- If the number of write cycles between the fifth to the last cycle of the Write-to-Buffer command is greater than WC +1, the operation aborts.
- After completing the Write-to-Buffer command sequence, issuing any command other than the Program Buffer-to-Flash command, aborts the operation.
- Loading a block address, i.e. A_{21}-A_{15}, in the Program Buffer-to-Flash command that does not match the block address used in the Write-to-Buffer command aborts the operation.

If the Write-to-Buffer or Program Buffer-to-Flash operation aborts, then DQ_1 = 1 and the device enters Write-Buffer-Abort mode. To execute another operation, a Write-to-Buffer Abort-Reset command must be issued to clear DQ_1 and return the device to standard read mode.

After the Write-to-Buffer and Program Buffer-to-Flash commands are successfully issued, the programming operation can be monitored using Data# Polling, Toggle Bits, and RY/BY#.

Sector/Block-Erase Operations

The Sector-Erase and Block-Erase operations allow the system to erase the device on a sector-by-sector, or block-by-block, basis. The SST38VF6401/6402/6403/6404 offer both Sector-Erase and Block-Erase modes.

The Sector-Erase architecture is based on a sector size of 4 KWords. The Sector-Erase command can erase any 4 KWord sector (S0 - S1023).

The Block-Erase architecture is based on block size of 32 KWords. In SST38VF6401 and SST38VF6402 devices, the Block-Erase command can erase any 32KWord Block (B0-B127). For the non-uniform boot block devices, SST38VF6403 and SST38VF6404, the Block-Erase command can erase any 32 KWord block except the block that contains the boot area. In the boot area, Block-Erase behaves like Sector-Erase, and only erases a 4KWord sector. For the SST38VF6403 device, a Block-Erase executed on the Boot Block (B0), will result in the device erasing a 4KWord sector in B0 located at A_{21}-A_{12}. For the SST38VF6404 device, a Block-Erase executed on the Boot Block (B127), will result in the device erasing a 4KWord sector in B127 located at A_{21}-A_{12}.

The Sector-Erase operation is initiated by executing a six-byte command sequence with Sector-Erase command (50H) and sector address (SA) in the last bus cycle. The Block-Erase operation is initiated by executing a six-byte command sequence with Block-Erase command (30H) and block address (BA) in the last bus cycle. The sector or block address is latched on the falling edge of the sixth WE# pulse, while the command (50H or 30H) is latched on the rising edge of the sixth WE# pulse. The internal Erase operation begins after the sixth WE# pulse. The End-of-Erase operation can be determined using either Data# Polling or Toggle Bit methods. The RY/BY# pin can also be used to monitor the erase operation. For more information, see Figures 14 and 15 for timing waveforms and Figure 29 for the flowchart.

Any commands, other than Erase-Suspend, issued during the Sector- or Block-Erase operation are ignored. Any attempt to Sector- or Block-Erase memory inside a block protected by Volatile Block Protection, Non-Volatile Block Protection, or WP# (low) will be ignored. During the command sequence, WP# should be statically held high or low.

Erase-Suspend/Erase-Resume Commands

The Erase-Suspend operation temporarily suspends a Sector- or Block-Erase operation thus allowing data to be read or programmed into any sector or block that is not engaged in an Erase operation. The operation is executed with a one-byte command sequence with Erase-Suspend command (B0H). The device automatically enters read mode within 20 µs (max) after the Erase-Suspend command had been issued. Valid data can be read, using a Read or Page Read operation, from any sector or block that is not being erased. Reading at an address location within Erase-Suspended sectors or blocks will output DQ_2 toggling and DQ_6 at '1'. While in Erase-Suspend, a Word-Program or Write-Buffer Programming operation is allowed anywhere except the sector or block selected for Erase-Suspend.

To resume a suspended Sector-Erase or Block-Erase operation, the system must issue the Erase-Resume command. The operation is executed by issuing one byte command sequence with Erase-Resume command (30H) at any address in the last Byte sequence.

When an erase operation is suspended, or re-suspended, after resume the cumulative time needed for the erase operation to complete is greater than the erase time of a non-suspended erase operation. If the hold time from Erase-Resume to the next Erase- Suspend operation is less than 200µs, the accumulative erase time can become very long Therefore, after issuing an Erase-Resume command, the system must wait at least 200µs before issuing another Erase-Suspend command. The Erase-Resume command will be ignored until any program operations initiated during Erase-Suspend are complete.

Bypass mode can be entered while in Erase-Suspend, but only Bypass Word-Program is available for those sectors or blocks that are not suspended. Bypass Sector-Erase, Bypass Block-Erase, and Bypass Chip-Erase, Erase-Suspend, and Erase-Resume are not available. In order to resume an Erase operation, the Bypass mode must be exited before issuing Erase-Resume. For more information about Bypass mode, see “Bypass Mode” on page 17.

Chip-Erase Operation

The SST38VF6401/6402/6403/6404 devices provide a Chip-Erase operation, which erases the entire memory array to the ‘1’ state. This operation is useful when the entire device must be quickly erased.

The Chip-Erase operation is initiated by executing a six-byte command sequence with Chip-Erase command (10H) at address 555H in the last byte sequence. The Erase operation begins with the rising edge of the sixth WE# or CE#, whichever occurs first. During the Erase operation, the only valid reads are Toggle Bit, Data# Polling, or RY/BY#. See Table 11 for the command sequence, Figure 13 for timing diagram, and Figure 29 for the flowchart. Any commands issued during the Chip-Erase operation are ignored. If WP# is low, or any VPBs or NVPBs are in the protect state, any attempt to execute a Chip-Erase operation is ignored. During the command sequence, WP# should be statically held high or low.

Write Operation Status Detection

To optimize the system Write cycle time, the SST38VF6401/6402/6403/6404 provide two software means to detect the completion of a Write (Program or Erase) cycle The software detection includes two status bits: Data# Polling (DQ_7) and Toggle Bit (DQ_6). The End-of-Write detection mode is enabled after the rising edge of WE#, which initiates the internal Program or Erase operation.

The actual completion of the nonvolatile write is asynchronous with the system. Therefore, Data# Polling or Toggle Bit maybe be read concurrent with the completion of the write cycle. If this occurs, the system may possibly get an incorrect result from the status detection process. For example, valid data may appear to conflict with either DQ_7 or DQ_6. To prevent false results, upon detection of failures, the software routine should loop to read the accessed location an additional two times. If both reads are valid, then the device has completed the Write cycle, otherwise the failure is valid.

For the Write-Buffer Programming feature, DQ_1 informs the user if either the Write-to-Buffer or Program Buffer-to-Flash operation aborts. If either operation aborts, then $DQ_1 = 1$. DQ_1 must be cleared to '0' by issuing the Write-to-Buffer Abort Reset command.

The SST38VF6401/6402/6403/6404 also provide a RY/BY# signal. This signal indicates the status of a Program or Erase operation.

If a Program or Erase operation is attempted on a protected sector or block, the operation will abort. After the device initiates an abort, the corresponding Write Operation Status Detection Bits will stay active for approximately 200ns (program or erase) before the device returns to read mode.

For the status of these bits during a Write operation, see Table 4.

Data# Polling (DQ_7)

When the SST38VF6401/6402/6403/6404 are in an internal Program operation, any attempt to read DQ_7 will produce the complement of true data. For a Program Buffer-to-Flash operation, DQ7 is the complement of the last word loaded in the Write-Buffer using the Write-to-Buffer command. Once the Program operation is completed, DQ_7 will produce valid data. Note that even though DQ_7 may have valid data immediately following the completion of an internal Write operation, the remaining data outputs may still be invalid. Valid data on the entire data bus will appear in subsequent successive Read cycles after an interval of 1 µs.

During an internal Erase operation, any attempt to read DQ_7 will produce a '0'. Once the internal Erase operation is completed, DQ_7 will produce a '1'. The Data# Polling is valid after the rising edge of fourth WE# (or CE#) pulse for Program operation. For Sector-, Block- or Chip-Erase, the Data# Polling is valid after the rising edge of sixth WE# (or CE#) pulse. See Figure 11 for Data# Polling timing diagram and Figure 26 for a flowchart.

Toggle Bits (DQ_6 and DQ_2)

During the internal Program or Erase operation, any consecutive attempts to read DQ_6 will produce alternating '1's and '0's, i.e., toggling between '1' and '0'. When the internal Program or Erase operation is completed, the DQ_6 bit will stop toggling, and the device is then ready for the next operation. For Sector-, Block-, or Chip-Erase, the toggle bit (DQ_6) is valid after the rising edge of sixth WE# (or CE#) pulse. DQ_6 will be set to '1' if a Read operation is attempted on an Erase-Suspended Sector or Block. If Program operation is initiated in a sector/block not selected in Erase-Suspend mode, DQ_6 will toggle.

An additional Toggle Bit is available on DQ_2, which can be used in conjunction with DQ_6 to check whether a particular sector or block is being actively erased or erase-suspended. Table 4 shows detailed bit status information. The Toggle Bit (DQ_2) is valid after the rising edge of the last WE# (or CE#) pulse of Write operation. See Figure 12 for Toggle Bit timing diagram and Figure 26 for a flowchart.

DQ_1

If an operation aborts during a Write-to-Buffer or Program Buffer-to-Flash operation, DQ_1 is set to '1'. To reset DQ_1 to '0', issue the Write-to-Buffer Abort Reset command to exit the abort state. A power-off/power-on cycle or a Hardware Reset (RST# = 0) will also clear DQ_1.

RY/BY#

The RY/BY# pin can be used to determine the status of a Program or Erase operation. The RY/BY# pin is valid after the rising edge of the final WE# pulse in the command sequence. If RY/BY# = 0, then the device is actively programming or erasing. If RY/BY# = 1, the device is in Read mode. The RY/BY# pin is an open drain output pin. This means several RY/BY# can be tied together with a pull-up resistor to V_{DD}..

Table 4: Write Operation Status

Status		DQ_7[1]	DQ_6	DQ_2[1]	DQ_1	RY/BY#[2]
Normal Operation	Standard Program	DQ_7#	Toggle	No Toggle	0	0
	Standard Erase	0	Toggle	Toggle	N/A	0
Erase-Suspend Mode	Read from Erase-Suspended Sector/Block	1	No toggle	Toggle	N/A	1
	Read from Non- Erase-Suspended Sector/Block	Data	Data	Data	Data	1
	Program	DQ_7#	Toggle	N/A	N/A	0
Program Buffer-to-Flash	Busy	DQ_7#[3]	Toggle	N/A	0	0
	Abort	DQ_7#[3]	Toggle	N/A	1	0

T4.0 20005015

1. DQ_7 and DQ_2 require a valid address when reading status information.
2. RY/BY# is an open drain pin. RY/BY# is high in Read mode, and Read in Erase-Suspend mode.
3. During a Program Buffer-to-Flash operation, the datum on the DQ_7 pin is the complement of DQ_7 of the last word loaded in the Write-Buffer using the Write-to-Buffer command.

Data Protection

The SST38VF6401/6402/6403/6404 provide both hardware and software features to protect nonvolatile data from inadvertent writes.

Hardware Data Protection

Noise/Glitch Protection: A WE# or CE# pulse of less than 5 ns will not initiate a write cycle.

V_{DD} Power Up/Down Detection: The Write operation is inhibited when V_{DD} is less than 1.5V.

Write Inhibit Mode: Forcing OE# low, CE# high, or WE# high will inhibit the Write operation. This prevents inadvertent writes during power-up or power-down.

Hardware Block Protection

The SST38VF6402 and SST39VF6404 devices support top hardware block protection, which protects the top boot block of the device. For SST38VF6402, the boot block consists of the top 32 KWord block, and for SST39VF6404 the boot block consists of the top two 4 KWord sectors (8 KWord total).

The SST38VF6401 and SST38VF6403 devices support bottom hardware block protection, which protects the bottom boot block of the device. For SST38VF6401, the boot block consists of the bottom 32 KWord block, and for SST39VF6403 the Boot Block consists of the bottom two 4 KWord sectors (8 KWord total). The boot block addresses are described in Table 5.

Table 5: Boot Block Address Ranges

Product	Size	Address Range
Bottom Boot Uniform SST38VF6401	32 KW	000000H-007FFFH
Top Boot Uniform SST38VF6402	32 KW	3F8000H-3FFFFFH
Bottom Boot Non-Uniform SST38VF6403	8 KW	000000H-001FFFH
Top Boot Non-Uniform SST38VF6404	8 KW	3FE000H-3FFFFFH

T5.0 20005015

Program and Erase operations are prevented on the Boot Block when WP# is low. If WP# is left floating, it is internally held high via a pull-up resistor. When WP# is high, the Boot Block is unprotected, which allows Program and Erase operations on that area.

Hardware Reset (RST#)

The RST# pin provides a hardware method of resetting the device to read array data. When the RST# pin is held low for at least T_{RP}, any in-progress operation will terminate and return to Read mode. When no internal Program/Erase operation is in progress, a minimum period of T_{RHR} is required after RST# is driven high before a valid Read can take place. See Figure 20 for more information.

The interrupted Erase or Program operation must be re-initiated after the device resumes normal operation mode to ensure data integrity.

Software Data Protection (SDP)

The SST38VF6401/6402/6403/6404 devices implement the JEDEC approved Software Data Protection (SDP) scheme for all data alteration operations, such as Program and Erase. These devices are shipped with the Software Data Protection permanently enabled. See Table 11 for the specific software command codes.

All Program operations require the inclusion of the three-byte sequence. The three-byte load sequence is used to initiate the Program operation, providing optimal protection from inadvertent Write operations. SDP for Erase operations is similar to Program, but a six-byte load sequence is required for Erase operations.

During SDP command sequence, invalid commands will abort the device to read mode within T_{RC}. The contents of DQ_{15}-DQ_8 can be V_{IL} or V_{IH}, but no other value, during any SDP command sequence.

The SST38VF6401/6402/6403/6404 devices provide Bypass Mode, which allows for reduced Program and Erase command sequence lengths. In this mode, the SDP portion of Program and Erase command sequences are omitted. See “Bypass Mode” on page 17. for further details.

Common Flash Memory Interface (CFI)

The SST38VF6401/6402/6403/6404 contain Common Flash Memory Interface (CFI) information that describes the characteristics of the device. In order to enter the CFI Query mode, the system can either write a one-byte sequence using a standard CFI Query Entry command, or a three-bye sequence using the SST CFI Query Entry command. A comparison of these two commands is shown in Table 11. Once the device enters the CFI Query mode, the system can read CFI data at the addresses given in Tables 13 through 16.

The system must write the CFI Exit command to return to Read mode. Note that the CFI Exit command is ignored during an internal Program or Erase operation. See Table 11 for software command codes, Figures 17 and 18 for timing waveform, and Figures 27 and 28 for flowcharts.

Product Identification

The Product Identification mode identifies the devices as the SST38VF6401, SST38VF6402, SST38VF6403, or SST38VF6404, and the manufacturer as SST. See Table 6 for specific address and data information. Product Identification mode is accessed through software operations. The software Product Identification operations identify the part, and can be useful when using multiple manufacturers in the same socket. For details, see Table 11 for software operation, Figure 16 for the software ID Entry and Read timing diagram, and Figure 27 for the software ID Entry command sequence flowchart.

Table 6: Product Identification

	Address	Data
Manufacturer’s ID	0000H	BFH
Device ID		
SST38VF6401	0001H	536B
SST38VF6402	0001H	536A
SST38VF6403	0001H	536D
SST38VF6404	0001H	536C

T6.0 20005015

While in Product Identification mode, the Read Block Protection Status command determines if a block is protected. The status returned indicates if the block has been protected, but does not differentiate between Volatile Block Protection and Non-Volatile Block Protection. See Table 11 for further details.

The Read-Irreversible Block-Lock Status command indicates if the Irreversible Block Command has been issued. If $DQ_0 = 0$, then the Irreversible Lock command has been previously issued.

In order to return to the standard Read mode, the software Product Identification mode must be exited. The exit is accomplished by issuing the software ID Exit command sequence, which returns the device to the Read mode. See Table 11 for software command codes, Figure 18 for timing waveform, and Figures 27 and 28 for flowcharts.

Security ID

The SST38VF6401/6402/6403/6404 devices offer a Security ID feature. The Secure ID space is divided into two segments — one factory programmed 128 bit segment and one user programmable 256 word segment. See Table 7 for address information. The first segment is programmed and locked and contains a 128 bit Unique ID which uniquely identifies the device. The user segment is left un-programmed for the customer to program as desired.

Table 7: Address Range for Sec ID

	Size	Address
Unique ID	128 bits	000H – 007H
User	256 W	100H – 1FFH

T7.1 20005015

The user segment of the Security ID can be programmed in several ways. For smaller datasets, use the Security ID Word-Program command for word-programming. To program larger sets of data more quickly, use the SEC ID Entry command to enter the Secure ID space. Once in the Secure ID space, use the Write-Buffer Programming or Bypass Mode feature. Note that the Word-Programming command can also be used while in this mode.

To detect end-of-write for the SEC ID, read the toggle bits. Do not use Data# Polling to detect end of Write. Once the programming is complete, lock the Sec ID by issuing the User Sec ID Program Lock-Out command or by programming bit ‘0’ in the PSR with the PSR Program command. Locking the Sec ID disables any corruption of this space. Note that regardless of whether or not the Sec ID is locked, the Sec ID segments can not be erased.

The Secure ID space can be queried by executing a three-byte command sequence with Enter Sec ID command (88H) at address 555H in the last byte sequence. To exit this mode, the Exit Sec ID command should be executed. Refer to Table 11 for software commands and Figures 27 and 28 for flow charts.

Bypass Mode

Bypass mode shortens the time needed to issue program and erase commands by reducing these commands to two write cycles each. After using the Bypass Entry command to enter the Bypass mode, only the Bypass Word-Program, Bypass Sector Erase, Bypass Block Erase, Bypass Chip Erase, Erase-Suspend, and Erase-Resume commands are available. The Bypass Exit command exits Bypass mode. See Table 11 for further details.

Entering Bypass Mode while already in Erase-Suspend limits the available commands. See “Erase-Suspend/Erase-Resume Commands” on page 11. for more information.

Protection Settings Register (PSR)

The Protection Settings Register (PSR) is a user-programmable register that allows for further customization of the SST38VF6401/6402/6403/6404 protection features. The 16-bit PSR provides four One Time Programmable (OTP) bits for users, each of which can be programmed individually. However, once an OTP bit is programmed to '0', the value cannot be changed back to a '1'. The other 12 bits of the PSR are reserved. See Table 8 for the definition of all 16-bits of the PSR.

Table 8: PSR Bit Definitions

Bit	Default from Factory	Definition
DQ_{15}-DQ_5	FFFh	Reserved
DQ_4	1	VPB power-up / hardware reset state 0 = all protected 1 = all unprotected
DQ_3	1	Reserved
DQ_2	1	Password mode 0 = Password only mode 1 = Pass-Through mode
DQ_1	1	Pass-Through mode 0 = Pass-Through only mode 1 = Pass-Through mode
DQ_0	1	SEC ID Lock Out Bit 0 = locked 1 = unlocked

T8.0 20005015

Note that DQ_4, DQ_2, DQ_1, DQ_0 do not have to be programmed at the same time. In addition, DQ2 and DQ1 cannot both be programmed to '0'. The valid combinations of states of DQ_2 and DQ_1 are shown in Table 9.

Table 9: Valid DQ_2 and DQ_1 Combinations

Combination	Definition
DQ_2, DQ_1 = 11	Pass-Through mode (factory default)
DQ_2, DQ_1 = 10	Pass-Through only mode
DQ_2, DQ_1 = 01	Password only mode
DQ_2, DQ_1 = 00	Not Allowed

T9.0 20005015

The PSR can be accessed by issuing the PSR Entry command. Users can then use the PSR Program and PSR Read commands. The PSR Exit command must be issued to leave this mode. See Table 11 for further details.

Individual Block Protection

The SST38VF6401/6402/6403/6404 provide two methods for Individual Block protection: Volatile Block Protection and Non-Volatile Block Protection. Data in protected blocks cannot be altered.

Volatile Block Protection

The Volatile Block Protection feature provides a faster method than Non-Volatile Protection to protect and unprotect 32 KWord blocks. Each block has it's own Volatile Protection Bit (VPB). In the SST38VF6401/2, the 32 KWord boot block also has a VPB. In the SST38VF6403/4 devices, each of the two 4 KWord sectors in the 8 KWord boot area has it's own VPB.

After using the Volatile Block Protection Mode Entry command to enter the Volatile Block Protection mode, individual VPBs can be set or reset with VPB Set/Clear, or be read with VPB Status Read. If the VPB is '0', then the block is protected from Program and Erase. If the VPB is '1', then the block is unprotected. The Volatile Block Protection Exit command must be issued to exit Volatile Block Protection mode. See Table 11 for further details on the commands and Figure 31 for a flow chart.

If the device experiences a hardware reset or a power cycle, all the VPBs return to their default state as determined by user-programmable bit DQ_4 in the PSR. If DQ_4 is '0', then all VPBs default to '0' (protected). If DQ_4 is '1', then all VPBs default to '1' (unprotected).

Non-Volatile Block Protection

The Non-Volatile Block Protection feature provides protection to individual blocks using Non-Volatile Protection Bits (NVPBs). Each block has it's own Non-Volatile Protection Bit. In the SST38VF6401/2, the 32 KWord boot block also has a it's own NVPB. In the SST38VF6403/4, each 4 KWord sector in the 8KWord boot area has it's own NVPB. All NVPBs come from the factory set to '1', the unprotected state.

Use the Non-Volatile Block Protection Mode Entry command to enter the Non-Volatile Block Protection mode. Once in this mode, the NVPB Program command can be used to protect individual blocks by setting individual NVPBs to '0'. The time needed to program an NVPB is two times T_{BP}, which is a maximum of 20µs. The NVPB Status Read command can be used to check the protection state of an individual NVPB.

To change an NVPB to '1', the unprotected state, the NVPB must be erased using NVPBs Erase command. This command erases all NVPBs to '1'. NVPB Program should be used to set the NVPBs of any blocks that are to be protected before exiting the Non-Volatile Block Protection mode. See Table 11 and Figure 32 for further details.

Upon a power cycle or hardware reset, the NVPBs retain their states. Memory areas that are protected using Non-Volatile Block Protection remain protected. The NVPB Program and NVPBs Erase commands are permanently disabled once the Irreversible Block Lock command is issued. See "Irreversible Block Locking" on page 22 for further information.

Advanced Protection

The SST38VF6401/6402/6403/6404 provide Advanced Protection features that allow users to implement conditional access to the NVPBs. Specifically, Advanced Protection uses the Global Lock Bit to protect the NVPBs. If the Global Lock bit is '0' then all the NVPBs states are frozen and cannot be modified in any mode. If the Global Lock bit is '1', then all the NVPBs can be modified in Non-Volatile Block Protection mode. After using the Global Lock of NVPBs Entry command to enter the Global Lock of NVPBs mode, the Global Lock Bit can be activated by issuing a Set Global Lock Bit command, which sets the Global Lock Bit to '0'. The Global Lock bit cannot be set to '1' with this command. The status of the bit can be read with the Global Lock Bit Status command. Use the Global Lock of NVPBs Exit command to exit Global Lock of NVPBs mode. See Table 11 and Figure 33 for further details.

The steps used to change the Global Lock Bit from '0' to'1,' to allow access to the NVPBs, depend on whether the device has been set to use Pass-Through or Password mode. When using Advanced Protection, select either Pass-Through only mode or Password only mode by programming the DQ_2 and DQ_1 bits in the PSR. Although the factory default is Pass-Through mode (DQ_2 = 1, DQ_1 = 1), the user should explicitly chose either Pass-Through only mode (DQ_2 = 1, DQ_1 = 0), or Password only mode (DQ_2 = 0, DQ_1 = 1). Keeping the SST38VF6401/6402/6403/6404 in the factory default Pass-Through mode leaves the device open to unauthorized changes of DQ_2 and DQ_1 in the PSR. See "Protection Settings Register (PSR)" on page 18. for more information about the PSR.

Pass-Through Mode (DQ_2, DQ_1 = 1,0)

The Pass-Through Mode allows the Global Lock Bit state to be cleared to '1' by a power-down power-up sequence or a hardware reset (RST# pin = 0). No password is required in Pass-Through mode.

To set the Global Lock Bit to '0', use the Set Global Lock Bit command while in the Global Lock of NVPBs mode. Select the Pass-Through only mode by programming PSR bit DQ_2 = 1 and DQ_1 = 0.

Password Mode (DQ_2, DQ_1 = 0,1)

In the Password Mode, the Global Lock Bit is set to '0' by the Set Global Lock Bit command, a power-down power-up sequence, or a hardware reset (RST# pin = 0). Select the Password only mode by programming PSR bit DQ_2 = 0 and DQ_1 = 1. Note that when the PSR Program command is issued in Password mode, the Global Lock bit is automatically set to '0'.

In contrast to the Pass-Through Mode, in the Password mode, the only way to clear the Global Lock Bit to '1' is to submit the correct 64-bit password using the Submit Password command in Password Commands Mode. The words of the password can be submitted in any order as long as each 16 bit section of the password is matched with its correct address. After the entire 64 bit password is submitted, the device takes approximately 2 µs to verify the password. A subsequent Submit Password command cannot be issued until this verification time has elapsed.

The 64-bit password must be chosen by the user before programming the DQ_2 and DQ_1 OTP bits of the PSR to choose Password Mode. The default 64 bit password on the device from the factory is FFFFFFFFFFFFFFFFh.

Enter the Password Commands mode by issuing the Password Commands Entry command. Then, use the Password Program command to program the desired password. Use caution when programming the password because there is no method to reset the password to FFFFFFFFFFFFFFFFh. Once a password bit has been set to '0', it cannot be changed back to '1'. See Table 11 for further details about Password-related commands.

The password can be read using the Password Read command to verify the desired password has been programmed. Microchip recommends testing the password before permanently choosing Password Mode.

To test the password, do the following:

1. Enter the Global Lock of NVPBs mode.
2. Set the Global Lock Bit to '0', and verify the value.
3. Exit the Global Lock of NVPBs mode.
4. Enter the Password Commands mode.
5. Submit the 64-bit password with the Submit Password command.
6. Wait 2 µs for the device to verify the password.
7. Exit the Password Commands mode.
8. Re-enter the Global Lock of NVPBs mode
9. Read the Global Lock Bit with the Global Lock Bit Status Read command. The Global Lock bit should now be '1'.

After verifying the password, program the DQ_2 and DQ_1 OTP bits of the PSR to explicitly choose Password mode. Once the Password mode has been selected, the Password Read and Password Program commands are permanently disabled. There is no longer any method for reading or modifying the password. In addition, Microchip is unable to read or modify the password. If a Password Read command is issued while in Password mode, the data presented for each word of the password is FFFFh.

If the Password Mode is not explicitly chosen in the PSR, then the password can still be read and modified. Therefore, Microchip strongly recommends that users explicitly choose Password Mode in the PSR.

Irreversible Block Locking

The SST38VF6401/6402/6403/6404 provides Irreversible Block Locking, a feature that allows users to customize the size of Read-Only Memory (ROM) on the device and provides more flexibility than One-Time Programmable (OTP) memory.

Applying Irreversible Block Locking turns user-selected memory areas into ROM by permanently disabling Program and Erase operations to these chosen areas. Any area that becomes ROM cannot be changed back to Flash.

Any memory blocks in the main memory, including boot blocks, can be irreversibly locked. In non-uniform boot block devices (SST38VF6403 and SST38VF6404) each 4 KW sector in the boot area can be irreversibly locked. If desired, all blocks in the main memory can be irreversibly locked.

To use Irreversible Block Locking do the following:

1. Global Lock Bit should be ‘1’. The Irreversible Block Lock command is disabled when Global Lock Bit is ‘0’.
2. Enter the Non-Volatile Block Protection mode.
3. Use the NVPB Program command to protect only the blocks that are to be changed into ROM.
4. Exit the Non-Volatile Block Protection mode.
5. Issue the Irreversible Block Lock command (see Table 11 for details).

The Irreversible Block Lock command can only be used once. Issuing the command after the first time has no effect on the device.

Important: Once the Irreversible Block Lock command is used, the state of the NVPBs can no longer be changed or overridden. Therefore, the following features no longer have any effect on the device:

- Global Lock of NVPBs feature
- Password feature
- NVPB Program command
- NVPB Erase command
- DQ2 and DQ1 of PSR

In addition, WP# has no effect on any memory in the boot block area that has been irreversibly locked.

To verify whether the Irreversible Block Lock command has already been issued, enter the Product ID mode and read address 5FEH. If DQ_0 = 0, then Irreversible Block Lock has already been executed. When using this feature to determine if a specific block is ROM, use the NVPB Status Read.

Operations

Table 10: Operation Modes Selection

Mode	CE#	OE#	WE#	RST#	WP#	DQ	Address
Read	V_{IL}	V_{IL}	V_{IH}	H	X	D_{OUT}	A_{IN}
Program	V_{IL}	V_{IH}	V_{IL}	H	V_{IL}/V_{IH}[1]	D_{IN}	A_{IN}
Erase	V_{IL}	V_{IH}	V_{IL}	H	V_{IL}/V_{IH}[1]	X[2]	Sector or block address, XXH for Chip-Erase
Standby	V_{IH}	X	X	V_{IH}	X	High Z	X
Write Inhibit	X	V_{IL}	X	X	X	High Z/ D_{OUT}	X
Product Identification	X	X	V_{IH}	H	X	High Z/ D_{OUT}	X
Reset	X	X	X	L	X	High Z	X
Software Mode	V_{IL}	V_{IH}	V_{IL}	H	X	See Table 11	See Table 11

T10.0 20005015

1. WP# can be V_{IL} when programming or erasing outside of the bootblock.
   WP# must be V_{IH} when programming or erasing inside the bootblock area.
2. X can be V_{IL} or V_{IH}, but no other value.

Not Recommended for New Designs

T11.0 20005015

1. Address format A_{10}-A_0 (Hex). Addresses A_{11}- A_{21} can be V_{IL} or V_{IH}, but no other value, for the SST38VF6401/6402/6403/6404 command sequence.
2. DQ_{15}-DQ_8 can be V_{IL} or V_{IH}, but no other value, for command sequence
3. All read commands are in ***Bold Italics***.

4. Total number of cycles in this command sequence depends on the number of words to be written to the buffer. Additional words are written by repeating Write Cycle 5. Address (WA_X) values for Write Cycle 6 and later must have the same A21-A4 values as WA_X in Write Cycle 5.
   WC = Word Count. The value of WC is the number of words to be written into the buffer, minus 1. Maximum WC value is 15 (i.e. F Hex)
5. Erase-Suspend and Erase-Resume commands are also available in Bypass Mode.
6. For SST39VF6403, Sector-Erase or Block-Erase can be used to erase sectors S1016 - S1023. Use address SAx. Block Erase cannot be used to erase all 32kW of Block B127. For SST39VF6404, Sector-Erase or Block-Erase can be used to erase sectors S0 - S7. Use address SAx. Block Erase cannot be used to erase all 32kW of Block B0.
7. Once in SEC ID mode, the Word-Program, Write-Buffer Programming, and Bypass Word-Program features can be used to program the SEC ID area.
8. Unique ID is read with A_3 = 0 (Address range = 000000H to 000007H), User portion of SEC ID is read with A_8 = 1 (Address range = 000100H to 0001FFH).
   Lock-out Status is read with A_7-A_0 = FFH. Unlocked: DQ_3 = 1 / Locked: DQ_3 = 0. Lock status can also be checked by reading Bit '0' in the PSR.
9. Both Software ID Exit operations are equivalent
10. If bits are not locked, then the user-programmable portion of the Sec ID can be programmed over the previously unprogrammed bits (Data =1) using the Sec ID mode again (bits programmed '0' cannot be reversed to '1'). Valid Word-Addresses for the user-programmable portion of the Sec ID are from 000100H-0001FFH.
11. The device does not remain in Software Product ID Mode if powered down.
12. With A_{MS}-A_1 =0; Manufacturer ID = 00BFH, is read with A_0 = 0,
    SST38VF6401 Device ID = 536B, is read with A_0 = 1, SST38VF6402 Device ID = 536A, is read with A_0 = 1,
    SST38VF6403 Device ID = 536D, is ready with A_0 = 1, SST38VF6404 Device ID = 536C, is read with A_0 = 1.
13. BA_{X02}: A_{MS}-A_{15} = Block Address; A_{14}-A_8 = xxxxxx; A_7-A_0 = 02
14. Data = 00H unprotected block; Data = 01H protected block.
15. DQ_0 = 0 means the Irreversible Block Lock command has been previously used. DQ_0 = 1 means the Irreversible Block Lock command has not yet been used.
16. DQ_0 = 0 means that the Global Lock Bit is locked. DQ_0 = 1 means that the Global Lock Bit is unlocked.
17. For Non-Uniform Boot Block devices (i.e. 8 KWord size), in the boot area, use SA_X = Sector Address (sector size = 4 KWord).
18. DQ_0 = 0 means protected; DQ_0 = 1 means unprotected
19. Erases all NVPBs to '1' (unprotected)
20. Entire two-bus cycle sequence must be entered for each portion of the password.
21. Entire password sequence required for validation. The word order doesn't matter as long as the Address and Data pair match.
22. Reserved register bits (DQ_{15}-DQ_5 and DQ_3) must be '1' during program.
23. CFI Query Entry and SST CFI Query Entry are equivalent. Both allow access to the same CFI tables.
24. Global Lock Bit must be '1' before executing this command.

Note: Table 11 uses the following abbreviations:
X = Don't care (V_{IL} or V_{IH}, but no other value.
SA_X = Sector Address; uses A_{MS}-A_{12} address lines
BA_X= Block Address; uses A_{MS}-A_{15} address lines
WA = Word Address
WC = Word Count
PWA_X = Password Address; PWA_X = PWA_0, PWA_1, PWA_2 or PWA_3; A1 and A0 are used to select each 16-bit portion of the password
PWD_X = Password Data; PWD_X = $PSWD_0$, PWD_1, PWD_2, or PWD_3
A_{MS} = Most significant Address

Table 12: Protection Priority for Main Array

Package Power Dissipation Capability (T_A = 25°C) 1.0W
Surface Mount Solder Reflow Temperature . . . . . 260°C for 10 seconds
Output Short Circuit Current[1] . . . . . 50 mA

1. Outputs shorted for no more than one second. No more than one output shorted at a time.

Table 17: Operating Range

Range	Ambient Temp	V_{DD}
Commercial	0°C to +70°C	2.7-3.6V
Industrial	-40°C to +85°C	2.7-3.6V

T17.1 20005015

Table 18: AC Conditions of Test[1]

Input Rise/Fall Time	Output Load
5ns	C_L = 30 pF

T18.1 20005015

1. See Figures 22 and 23

Power-Up Specifications

All functionalities and DC specifications are specified for a V_{DD} ramp rate faster than 1V per 100 ms (0V to 3V in less than 300 ms). If the V_{DD} ramp rate is slower than 1V per 100 ms, a hardware reset is required. The recommended V_{DD} power-up to RESET# high time should be greater than 100 µs to ensure a proper reset. See Table 19and Figure 4 for more information.

Table 19: Recommended System Power-up Timings

Symbol	Parameter	Minimum	Units
$T_{PU-READ}$[1]	Power-up to Read Operation	100	µs
$T_{PU-WRITE}$[1]	Power-up to Erase/Program Operation	100	µs

T19.0 20005015

1. This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.

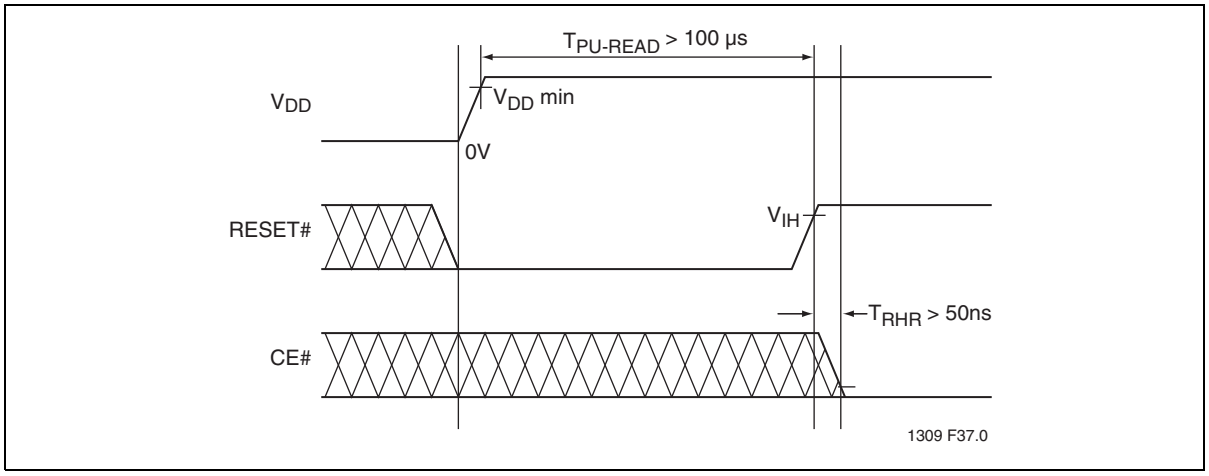

Figure 4: Power-Up Diagram

DC Characteristics

Table 20: DC Operating Characteristics V_{DD} = 2.7-3.6V[1]

Symbol	Parameter	Limits			Test Conditions
		Min	Max	Units	
I_{DD}	Power Supply Current				Address input=V_{ILT}/V_{IHT}[2], V_{DD}=V_{DD} Max
	Read[3]		18	mA	CE#=V_{IL}, OE#=WE#=V_{IH} at f= 5 MHz
	Intra-Page Read @5 MHz		2.5	mA	CE#=V_{IL}, OE#=WE#=V_{IH}
	Intra-Page Read @40 MHz		20	mA	CE#=V_{IL}, OE#=WE#=V_{IH}
	Program and Erase		35	mA	CE#=WE#=V_{IL}, OE#=V_{IH}
	Program-Write-Buffer-to-Flash		50	mA	CE#=WE#=V_{IL}, OE#=V_{IH}
I_{SB}	Standby V_{DD} Current		30	µA	CE#=V_{IHC}, V_{DD}=V_{DD} Max
I_{ALP}	Auto Low Power		20	µA	CE#=V_{ILC}, V_{DD}=V_{DD} Max All inputs=V_{SS} or V_{DD}, WE#=V_{IHC}
I_{LI}	Input Leakage Current		1	µA	V_{IN}=GND to V_{DD}, V_{DD}=V_{DD} Max
I_{LIW}	Input Leakage Current on WP# pin and RST#		10	µA	WP#=GND to V_{DD} or RST#=GND to V_{DD}
I_{LO}	Output Leakage Current		10	µA	V_{OUT}=GND to V_{DD}, V_{DD}=V_{DD} Max
V_{IL}	Input Low Voltage		0.8	V	V_{DD}=V_{DD} Min
V_{ILC}	Input Low Voltage (CMOS)		0.3	V	V_{DD}=V_{DD} Max
V_{IH}	Input High Voltage	0.7V_{DD}		V	V_{DD}=V_{DD} Max
V_{IHC}	Input High Voltage (CMOS)	V_{DD}-0.3		V	V_{DD}=V_{DD} Max
V_{OL}	Output Low Voltage		0.2	V	I_{OL}=100 µA, V_{DD}=V_{DD} Min
V_{OH}	Output High Voltage	V_{DD}-0.2		V	I_{OH}=-100 µA, V_{DD}=V_{DD} Min

T20.0 20005015

1. Typical conditions for the Active Current shown on the front page of the data sheet are average values at 25°C (room temperature), and V_{DD} = 3V. Not 100% tested.
2. See Figure 27
3. The I_{DD} current listed is typically less than 2mA/MHz, with OE# at V_{IH}. Typical V_{DD} is 3V.

Table 21: Capacitance (T_A = 25°C, f=1 Mhz, other pins open)

Parameter	Description	Test Condition	Maximum
$C_{I/O}$[1]	I/O Pin Capacitance	$V_{I/O}$ = 0V	12 pF
C_{IN}[1]	Input Capacitance	V_{IN} = 0V	6 pF

T21.0 20005015

1. This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.

Table 22: Reliability Characteristics

Symbol	Parameter	Minimum Specification	Units	Test Method
N_{END}[1,2]	Endurance	100,000	Cycles	JEDEC Standard A117
T_{DR}[1]	Data Retention	100	Years	JEDEC Standard A103
I_{LTH}[1]	Latch Up	100 + I_{DD}	mA	JEDEC Standard 78

T22.0 20005015

1. This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.
2. N_{END} endurance rating is qualified as 100,000 cycles minimum per block.

AC Characteristics

Note: A_{MS} = Most significant address
$A_{MS} = A_{21}$ for SST38VF6401/6402/6403/6404

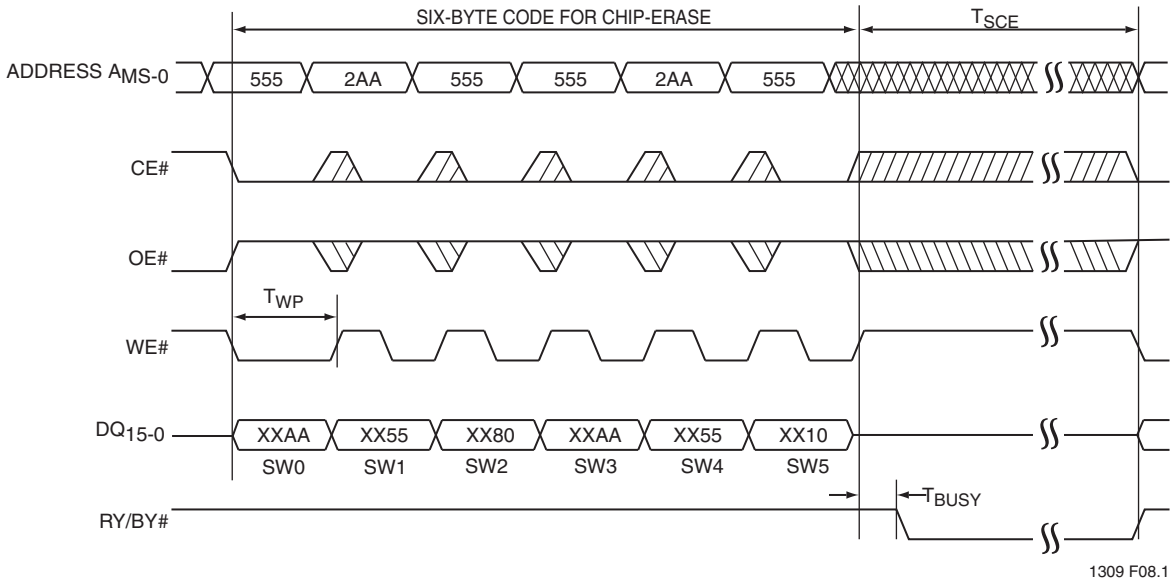
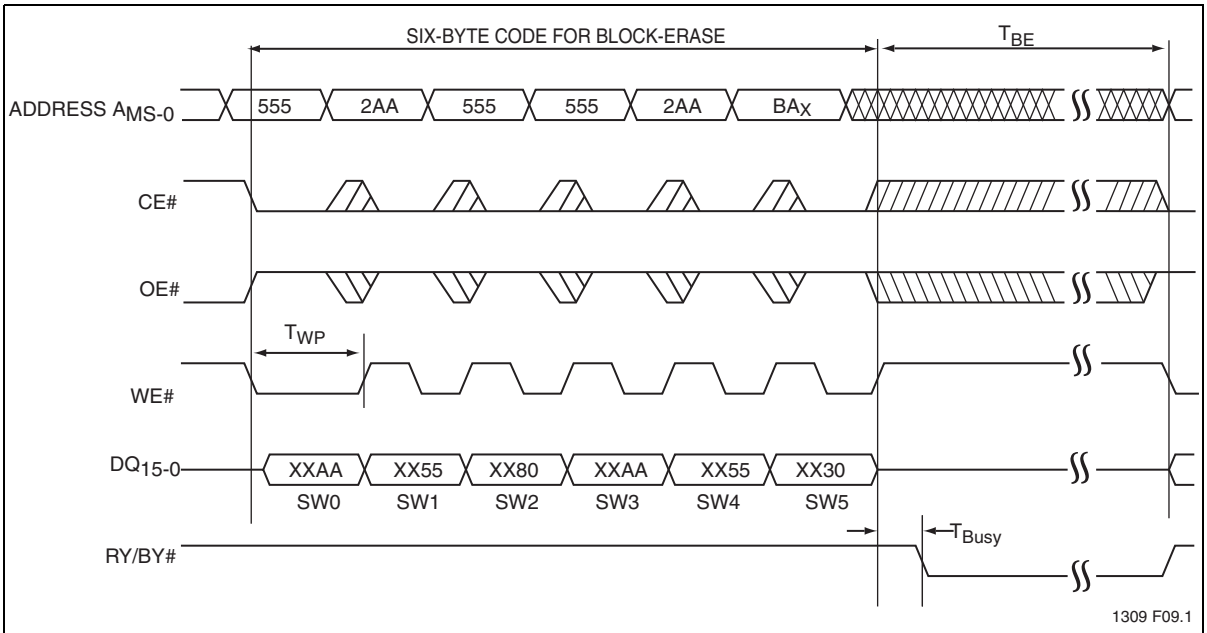
Figure 12: Toggle Bits Timing Diagram



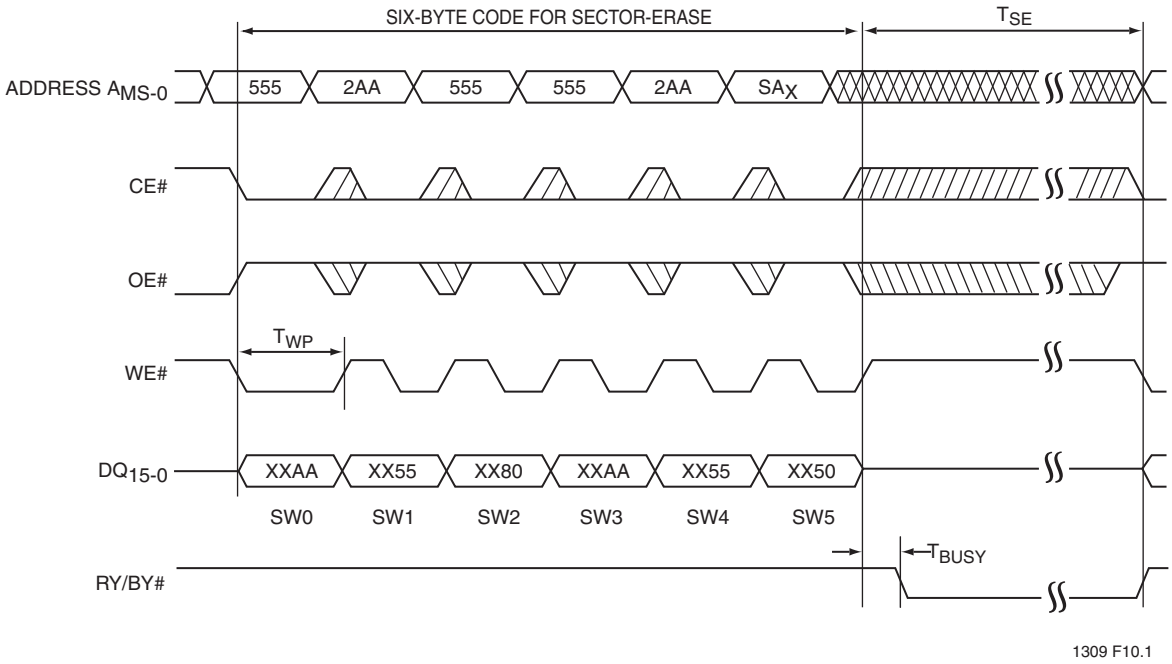
Note: This device also supports CE# controlled Chip-Erase operation The WE# and CE# signals are interchangeable as long as minimum timings are met. (See Table 24)
A_{MS} = Most significant address
A_{MS} = A_{21} for SST38VF6401/6402/6403/6404
WP# must be held in proper logic state (V_{IL} or V_{IH}) 1 µs prior to and 1 µs after the command sequence.

Figure 13: WE# Controlled Chip-Erase Timing Diagram



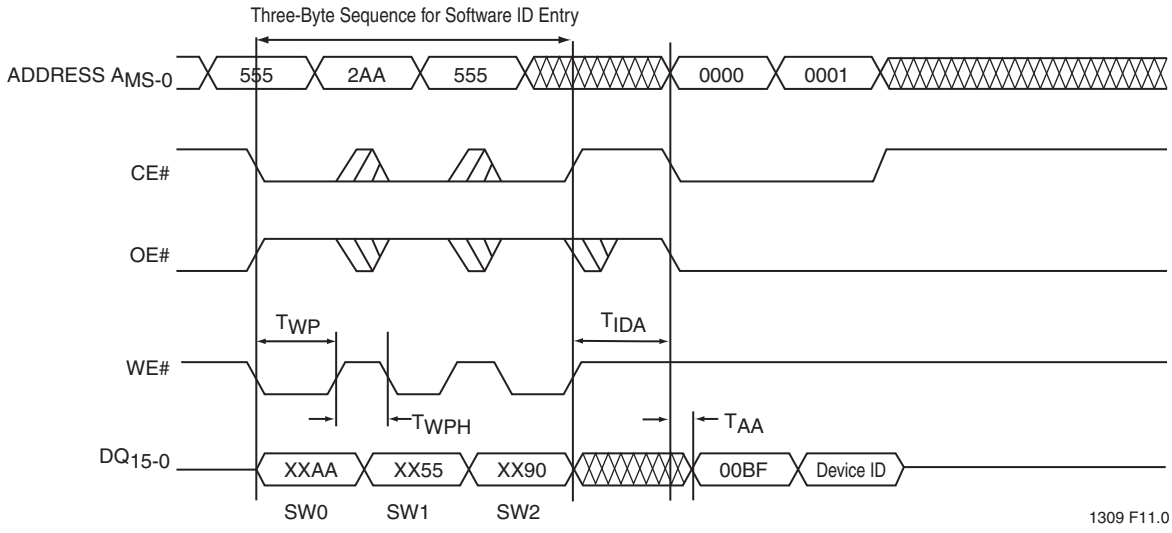
Note: This device also supports CE# controlled Block-Erase operation The WE# and CE# signals are interchangeable as long as minimum timings are met. (See Table 24)
BA_X = Block Address
A_{MS} = Most significant address
A_{MS} = A_{21} for SST38VF6401/6402/6403/6404
WP# must be held in proper logic state (V_{IL} or V_{IH}) 1 µs prior to and 1 µs after the command sequence.

Figure 14: WE# Controlled Block-Erase Timing Diagram



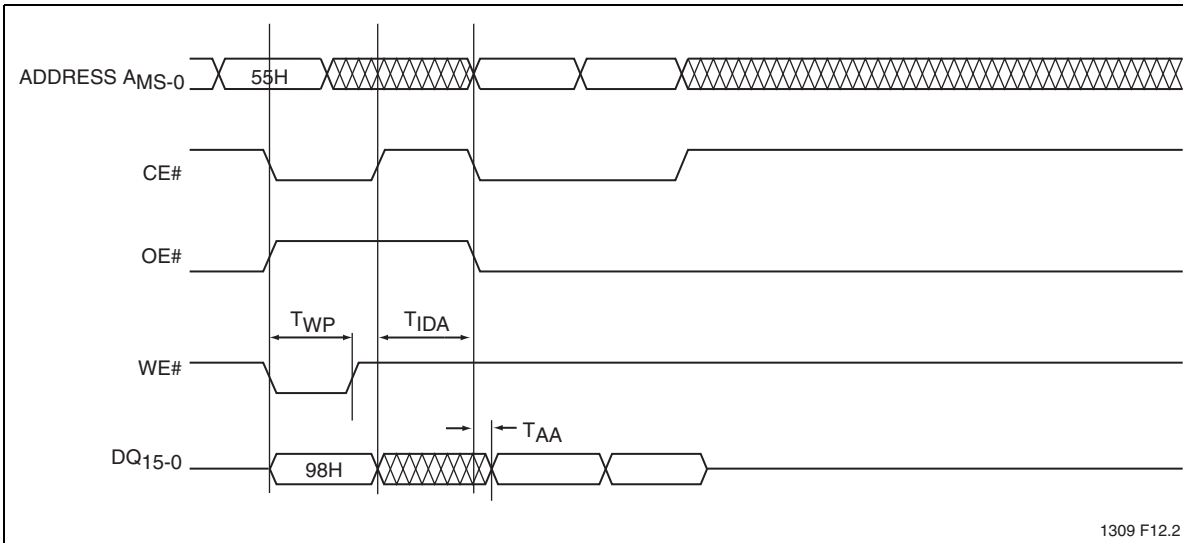
Note: This device also supports CE# controlled Sector-Erase operation The WE# and CE# signals are interchangeable as long as minimum timings are met. (See Table 24)
SA_X = Sector Address
A_{MS} = Most significant address
A_{MS} = A_{21} for SST38VF6401/6402/6403/6404
WP# must be held in proper logic state (V_{IL} or V_{IH}) 1 µs prior to and 1 µs after the command sequence.
X can be V_{IL} or V_{IH}, but no other value.

Figure 15: WE# Controlled Sector-Erase Timing Diagram



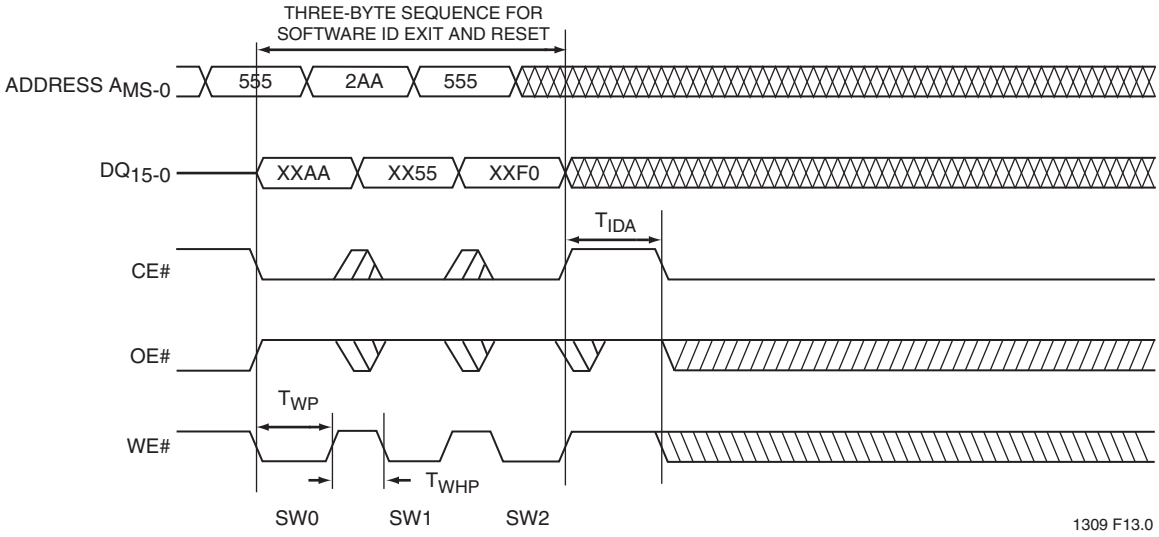
Note: Device ID = 536B for SST38VF6401, 536A for SST38VF6402, 536D for SST38VF6403, 536C for SST38VF6404
A_{MS} = Most significant address
$A_{MS} = A_{21}$ for SST38VF6401/6402/6403/6404
WP# must be held in proper logic state (V_{IL} or V_{IH}) 1 µs prior to and 1 µs after the command sequence.
X can be V_{IL} or V_{IH}, but no other value.

Figure 16: Software ID Entry and Read



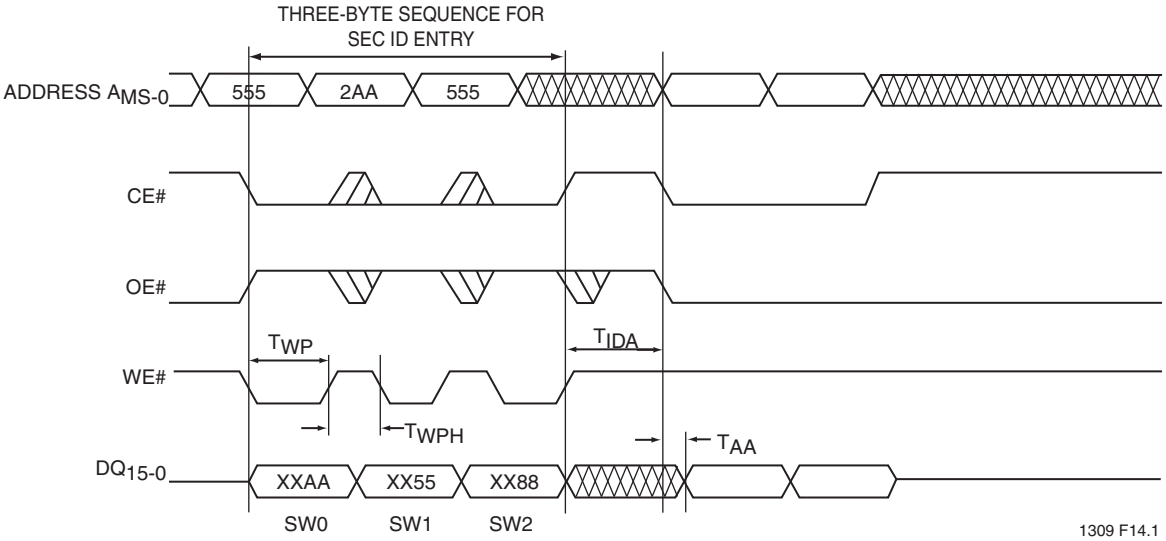
Note: WP# must be held in proper logic state (V_{IL} or V_{IH}) 1 µs prior to and 1 µs after the command sequence.
A_{MS} = Most significant address
$A_{MS} = A_{21}$ for SST38VF6401/6402/6403/6404

Figure 17: CFI Query Entry and Read



Note: WP# must be held in proper logic state (V_{IL} or V_{IH}) 1 µs prior to and 1 µs after the command sequence.
A_{MS} = Most significant address
A_{MS} = A_{21} for SST38VF6401/6402/6403/6404

Figure 18: Software ID Exit/CFI Exit



Note: A_{MS} = Most significant address
A_{MS} = A_{21} for SST38VF6401/6402/6403/6404
WP# must be held in proper logic state (V_{IL} or V_{IH}) 1 µs prior to and 1 µs after the command sequence.
X can be V_{IL} or V_{IH}, but no other value.

Figure 19: Sec ID Entry

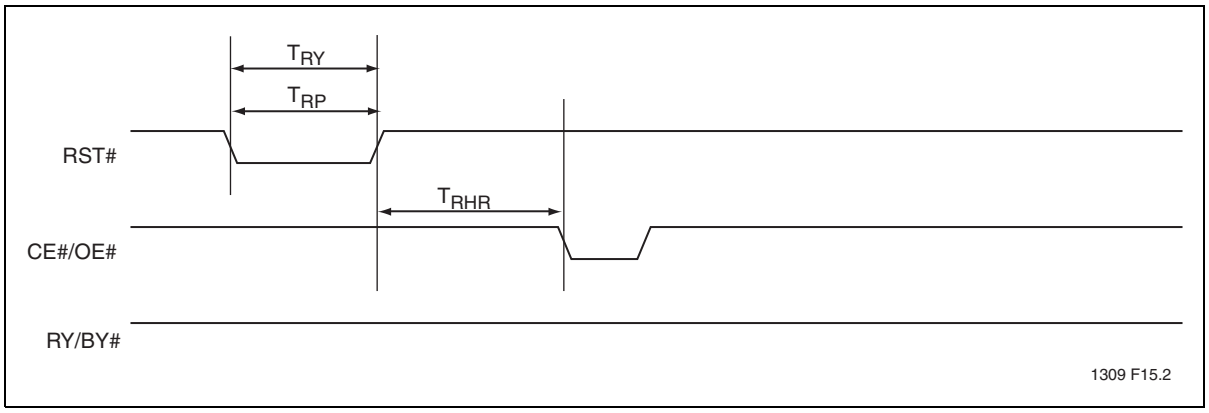


Figure 20: RST# Timing Diagram (When no internal operation is in progress)

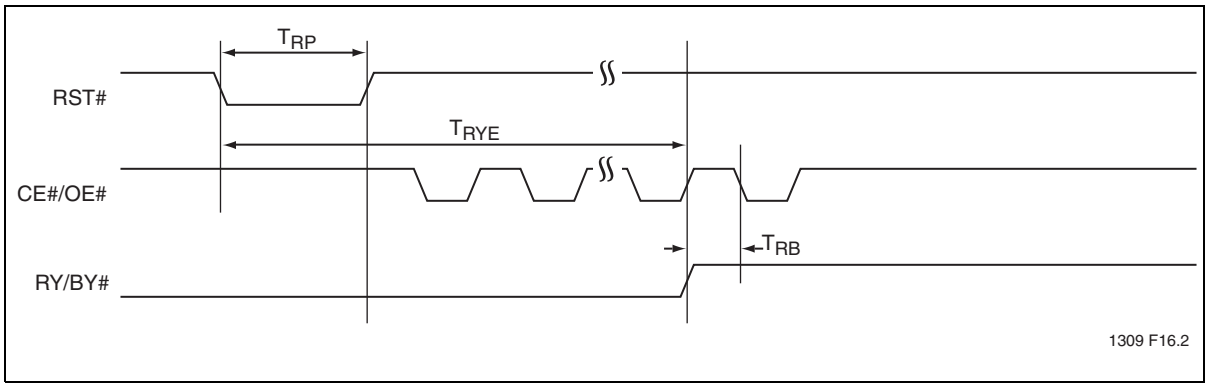

Figure 21: RST# Timing Diagram (During Program or Erase operation)

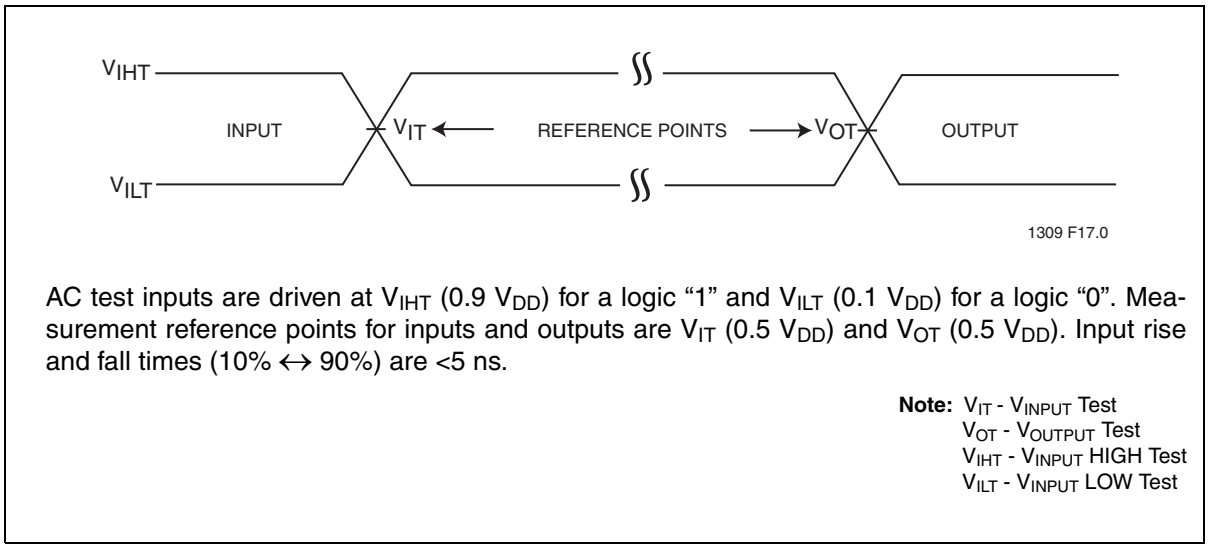

AC test inputs are driven at V_{IHT} (0.9 V_{DD}) for a logic "1" and V_{ILT} (0.1 V_{DD}) for a logic "0". Measurement reference points for inputs and outputs are V_{IT} (0.5 V_{DD}) and V_{OT} (0.5 V_{DD}). Input rise and fall times (10% ↔ 90%) are <5 ns.

Note: V_{IT} - V_{INPUT} Test
V_{OT} - V_{OUTPUT} Test
V_{IHT} - V_{INPUT} HIGH Test
V_{ILT} - V_{INPUT} LOW Test

Figure 22: AC Input/Output Reference Waveforms

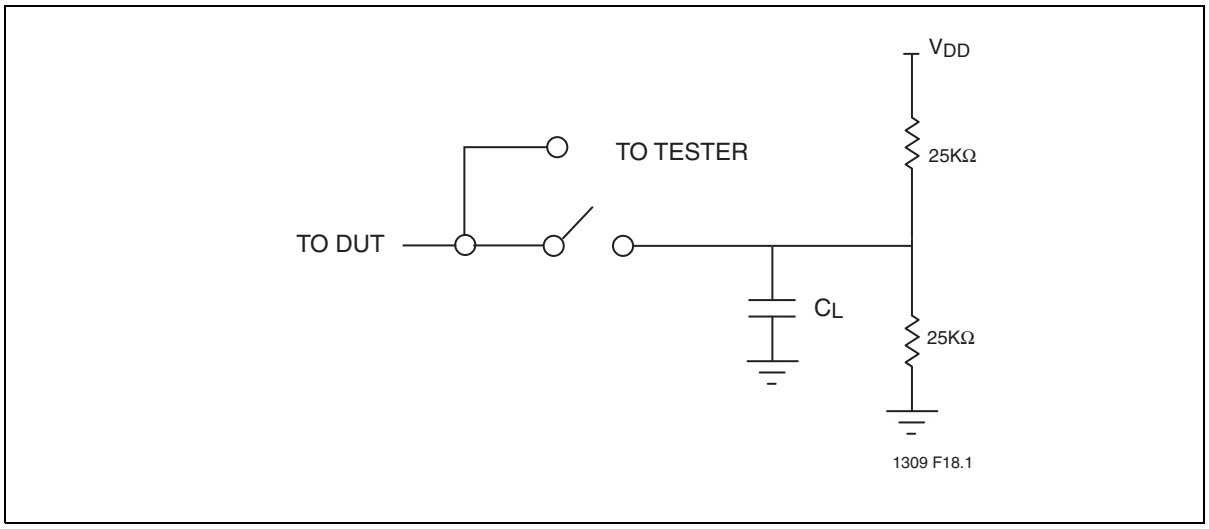

Figure 23: A Test Load Example

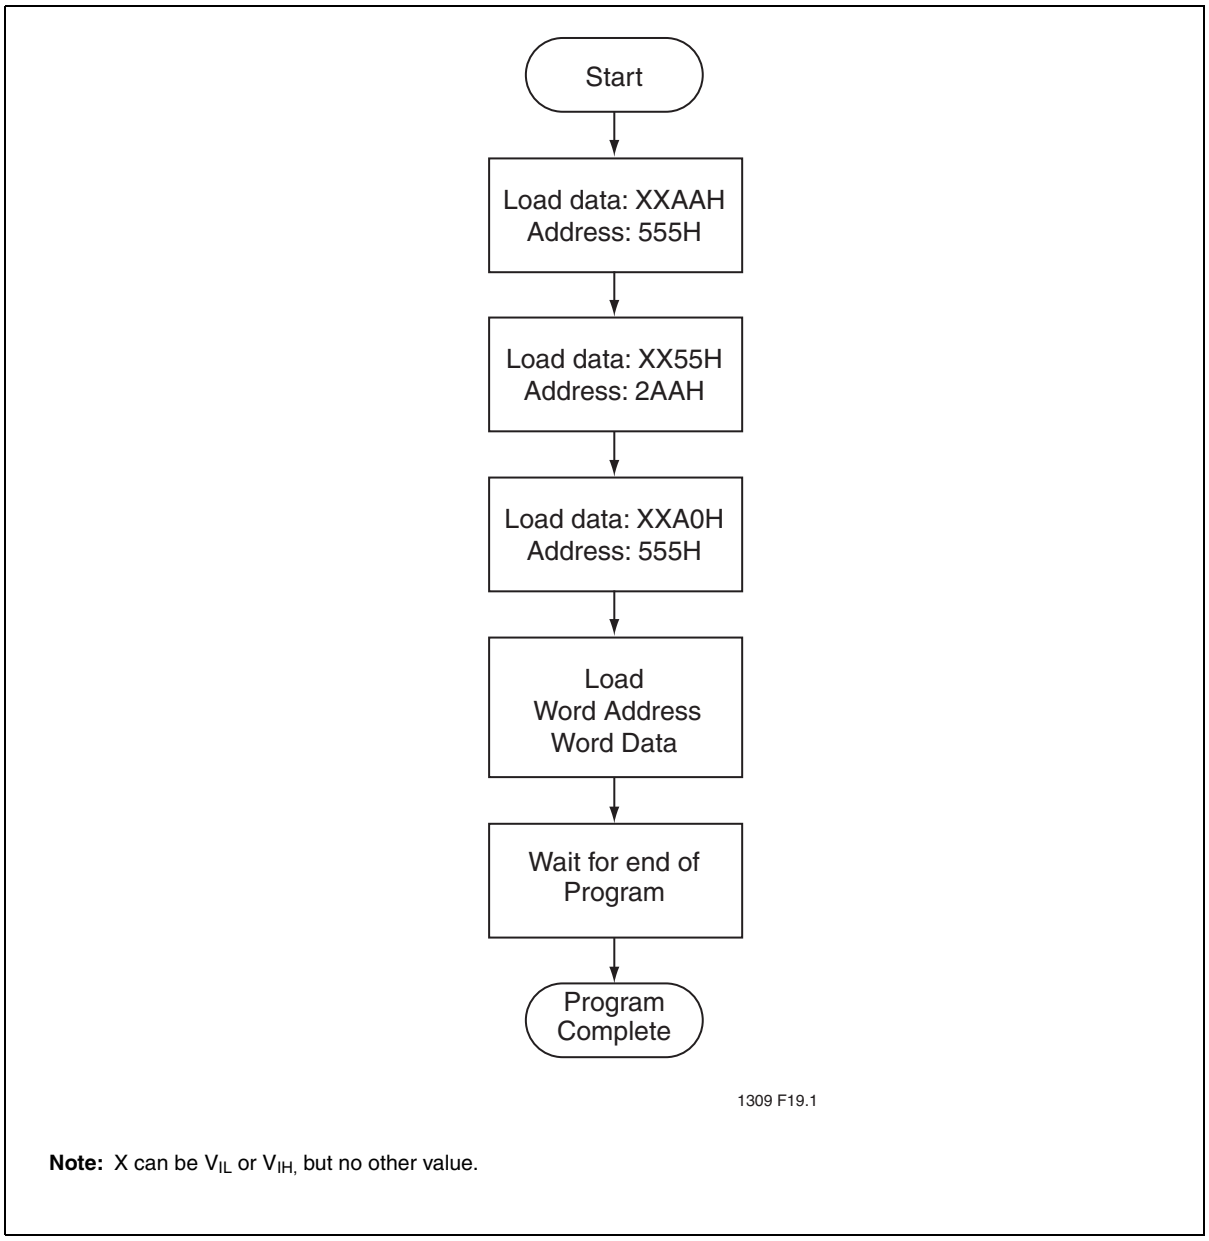
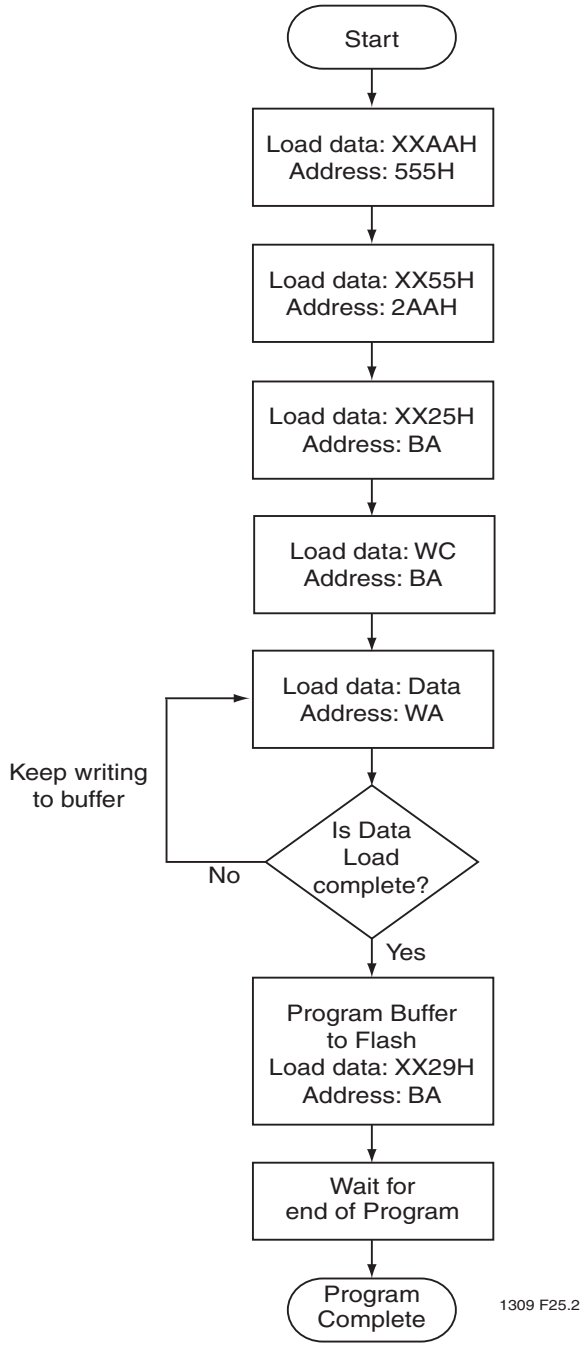


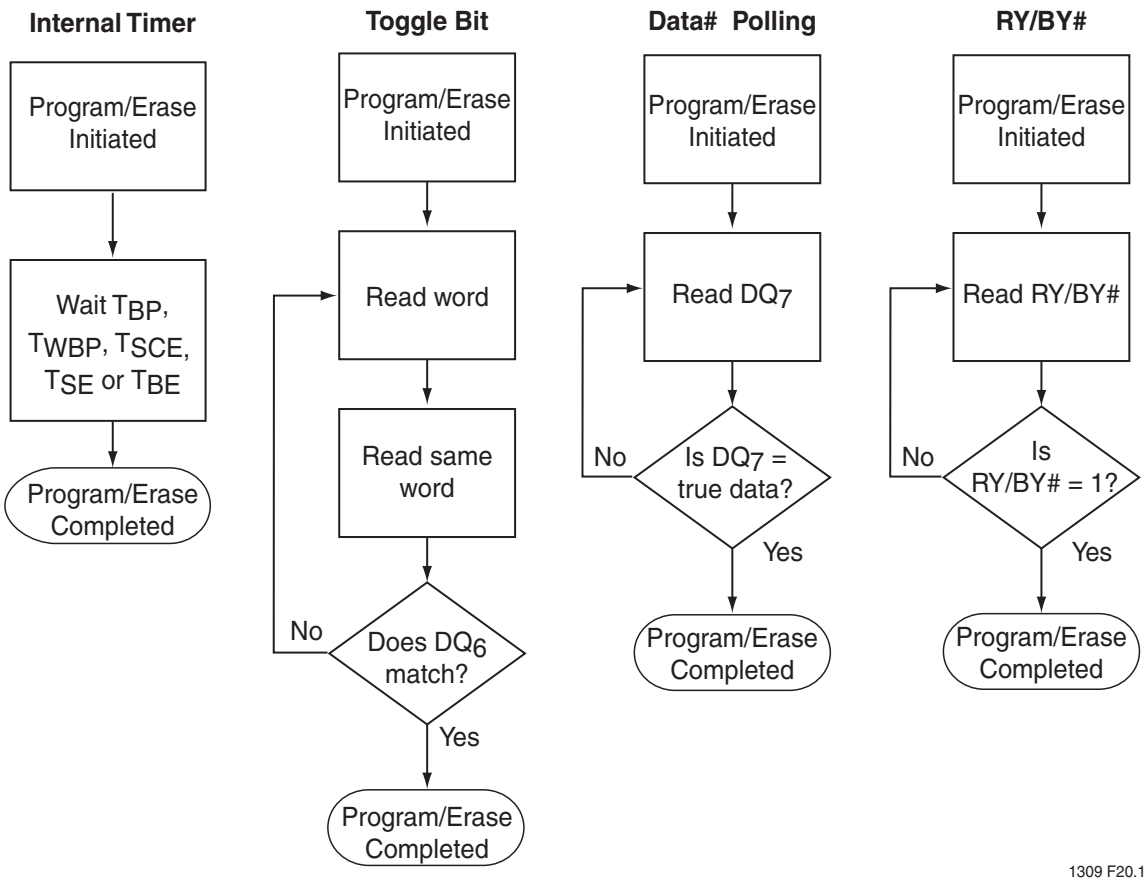
Note: X can be V_{IL} or V_{IH}, but no other value.

Figure 24: Word-Program Algorithm



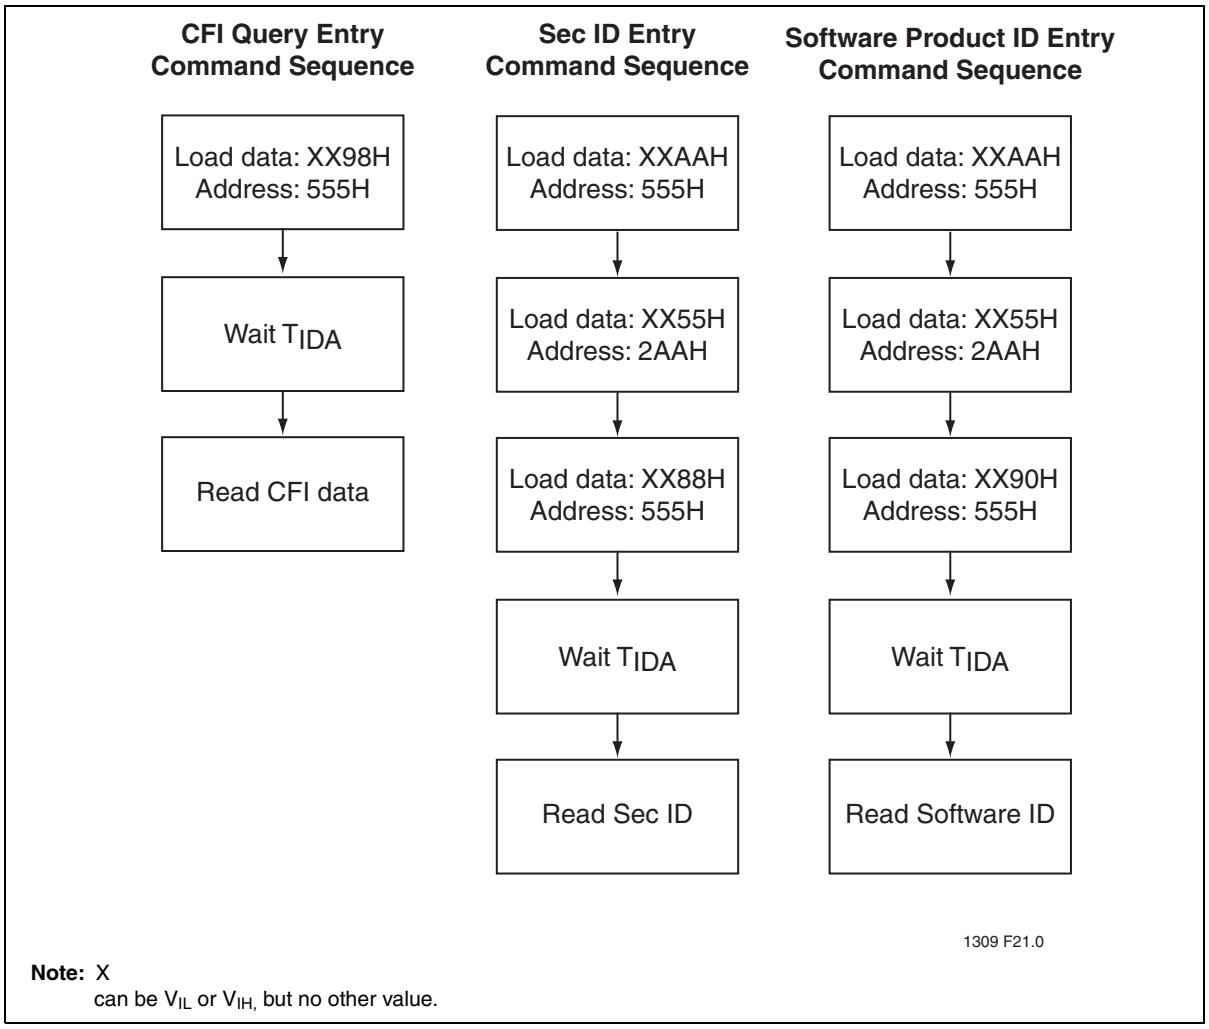
Note: BA= Block Address
WC = Word Count
WA = Address of word to program
All subsequent Address values (WA_X) in Write Cycle 6 and later must have the same A_{21}-A_4 as WA_X in Write Cycle 5.
X can be V_{IL} or V_{IH}, but no other value

Figure 25: Write-Buffer Programming



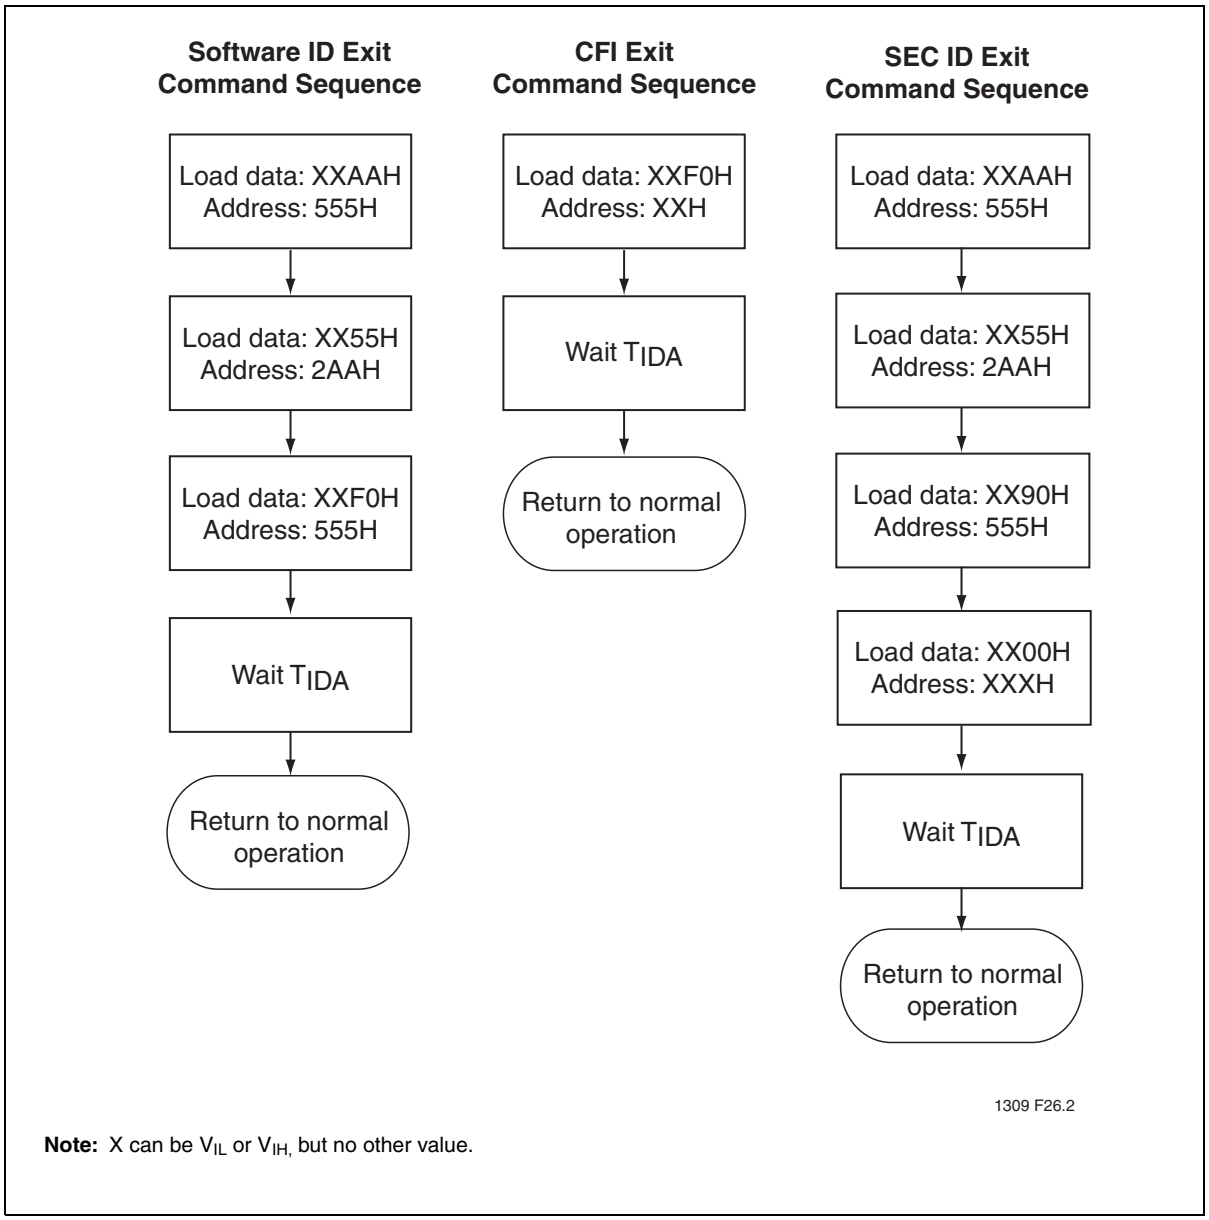
Note: For a Program Buffer-to-Flash Operation, the valid DQ_7 is from the last word loaded in the buffer using the Write-to-Program Buffer command.

Figure 26: Wait Options



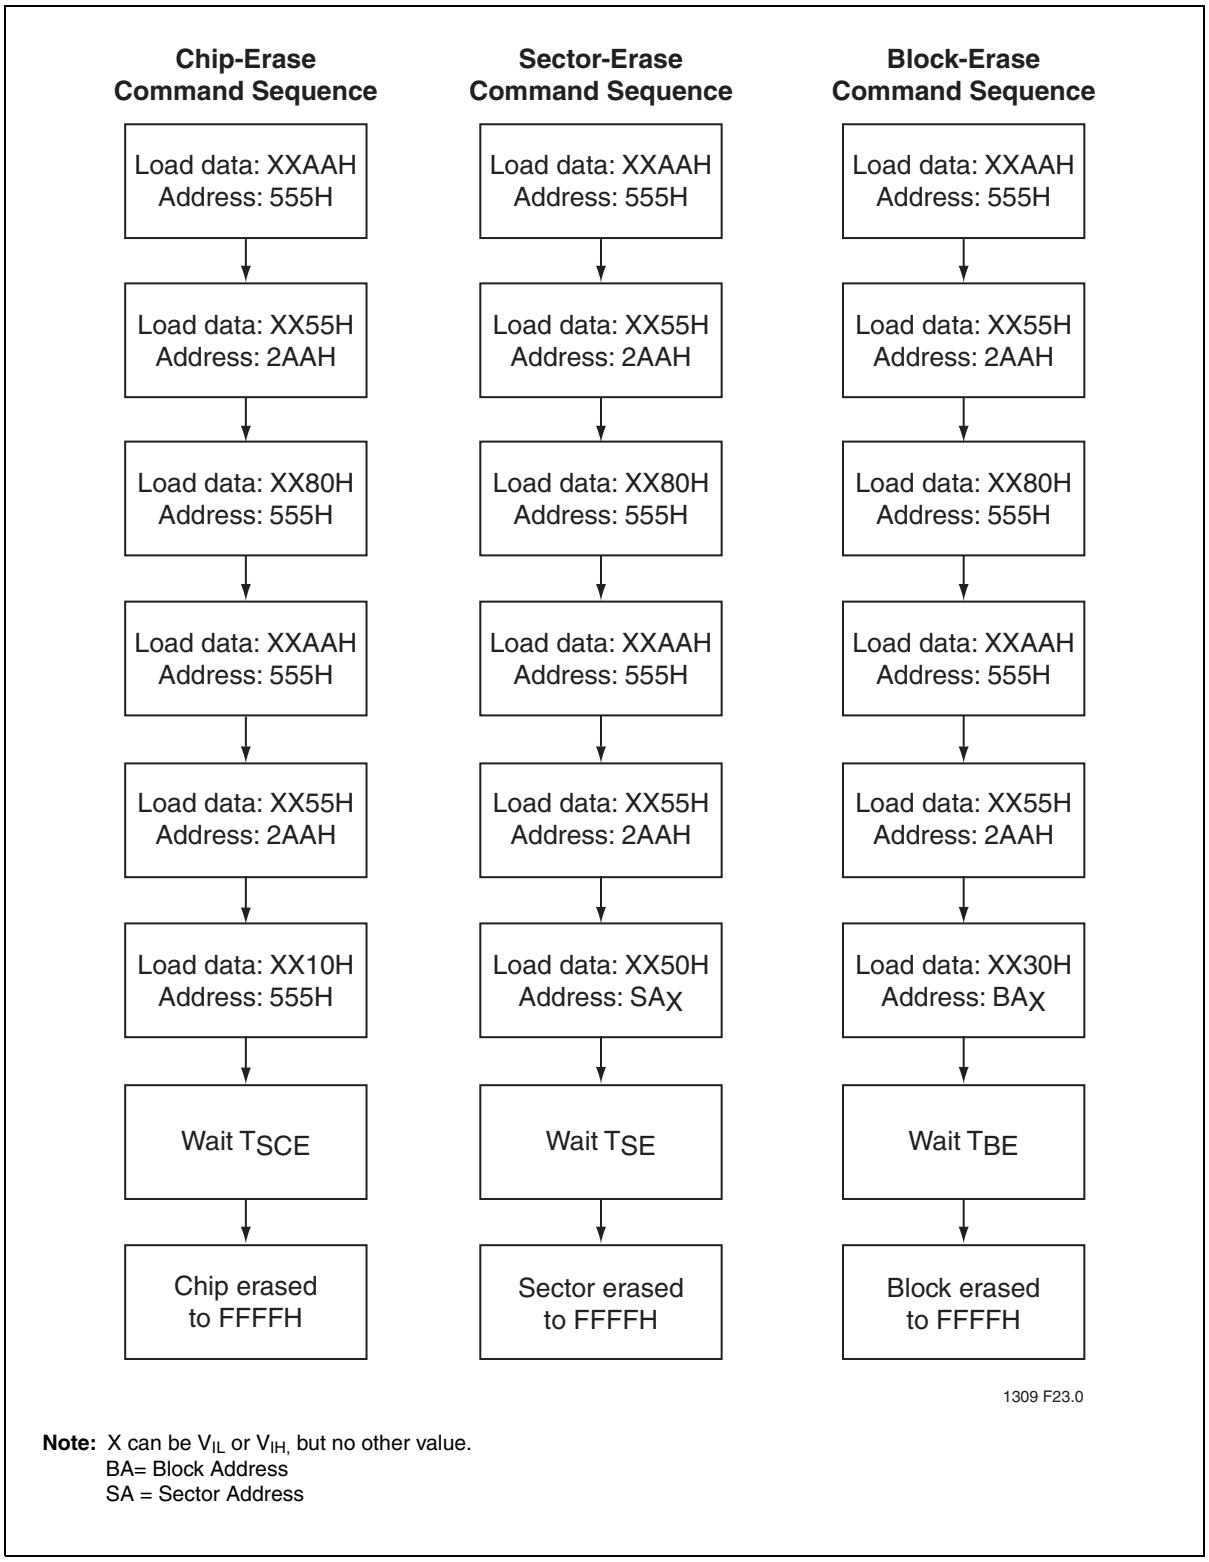
Note: X
can be V_{IL} or $V_{IH,}$ but no other value.

Figure 27: CFI/SEC ID/Software ID Entry Command Flowcharts



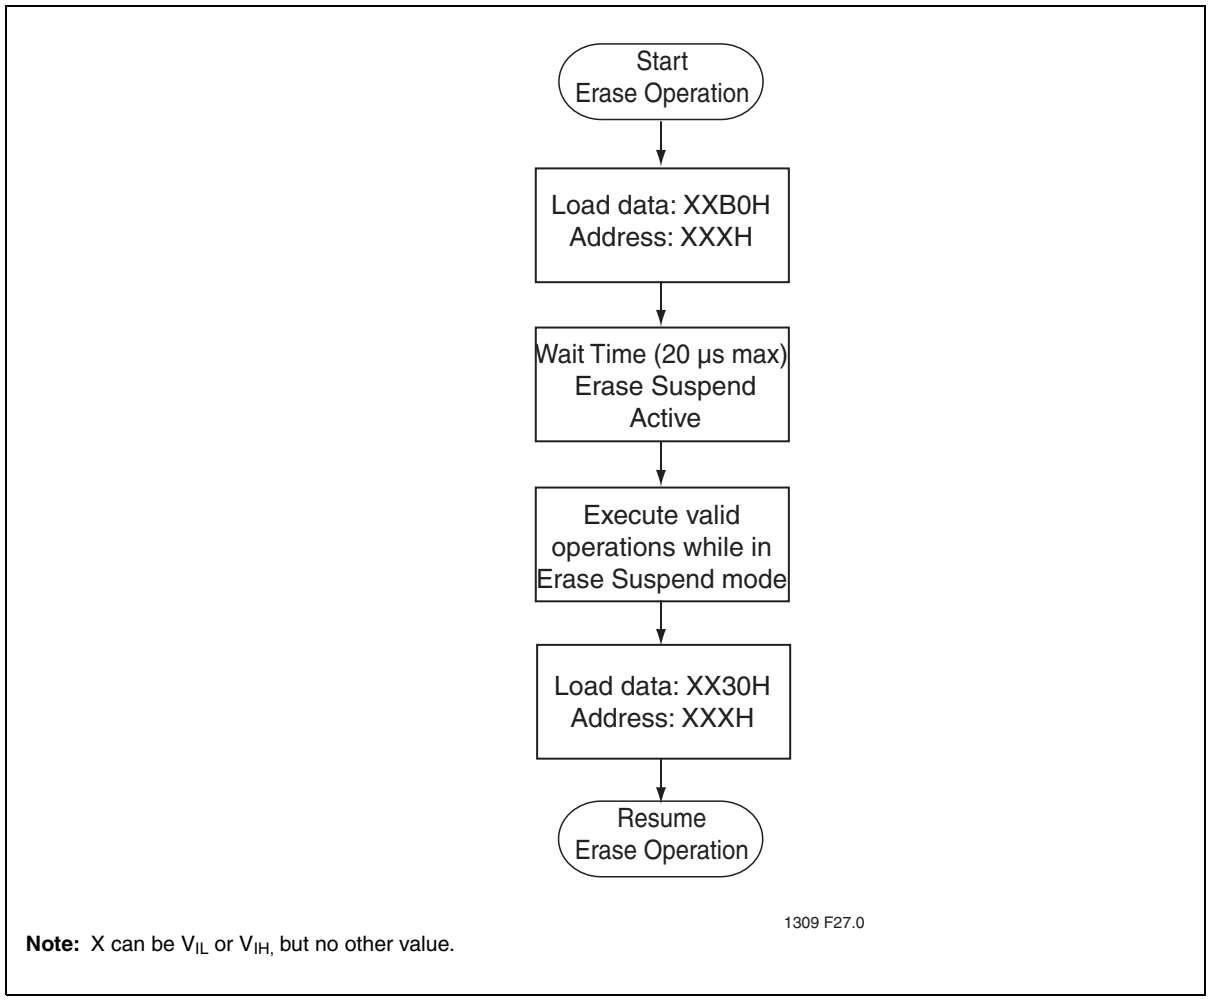
Note: X can be V_{IL} or V_{IH}, but no other value.

Figure 28: Software ID/CFI/SEC ID Exit Command Flowcharts



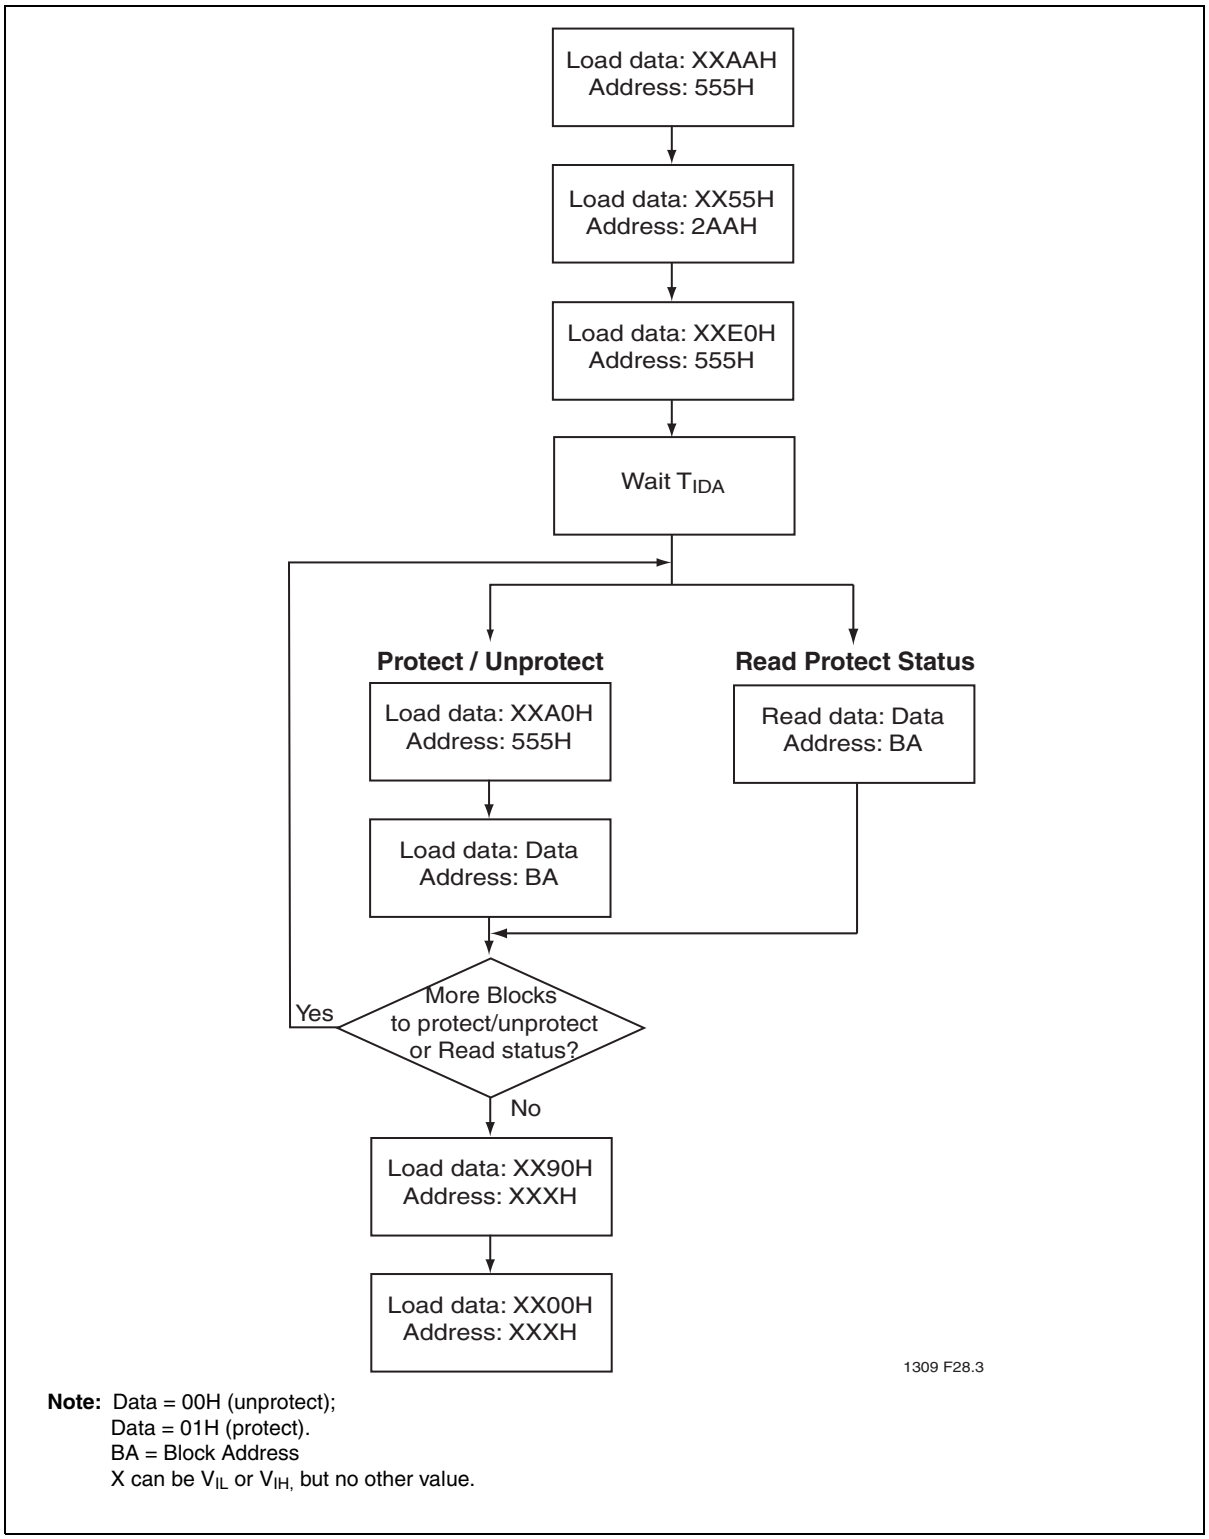
Note: X can be V_{IL} or V_{IH}, but no other value.
BA= Block Address
SA = Sector Address

Figure 29: Erase Command Sequence



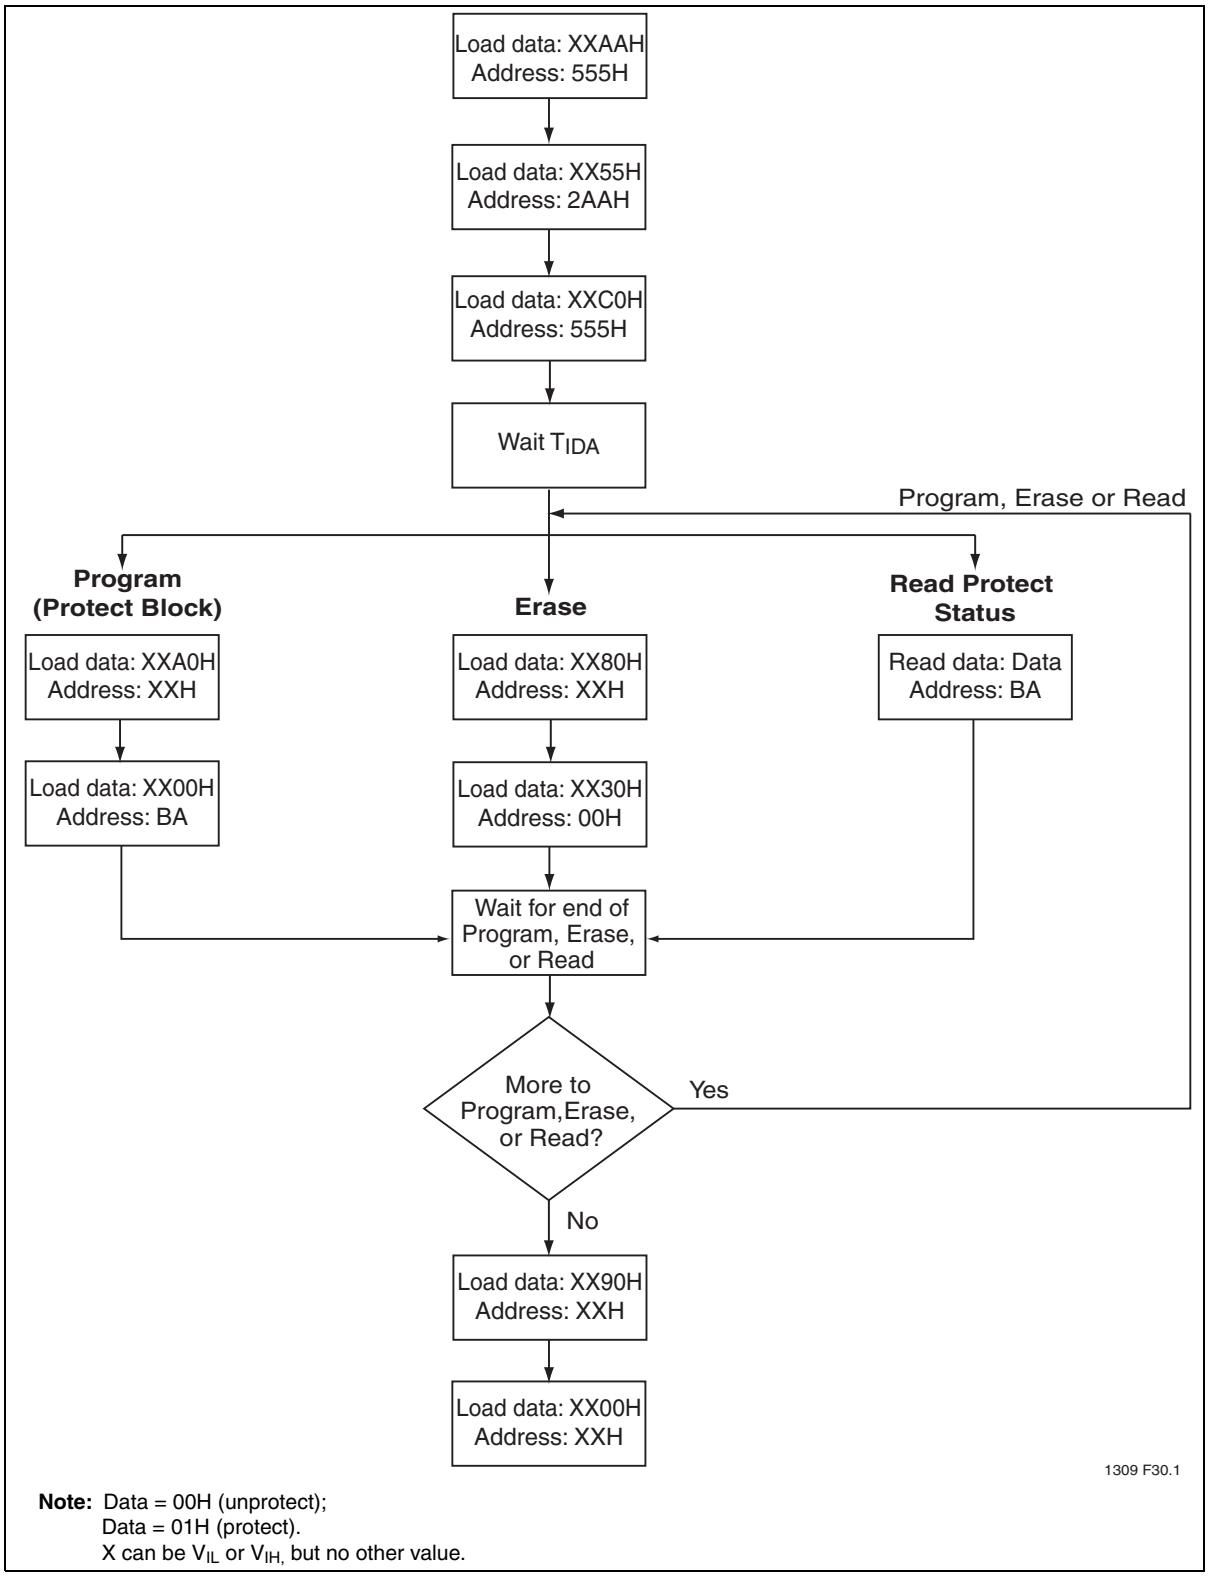
Note: X can be V_{IL} or V_{IH}, but no other value.

Figure 30: Erase Suspend/Resume



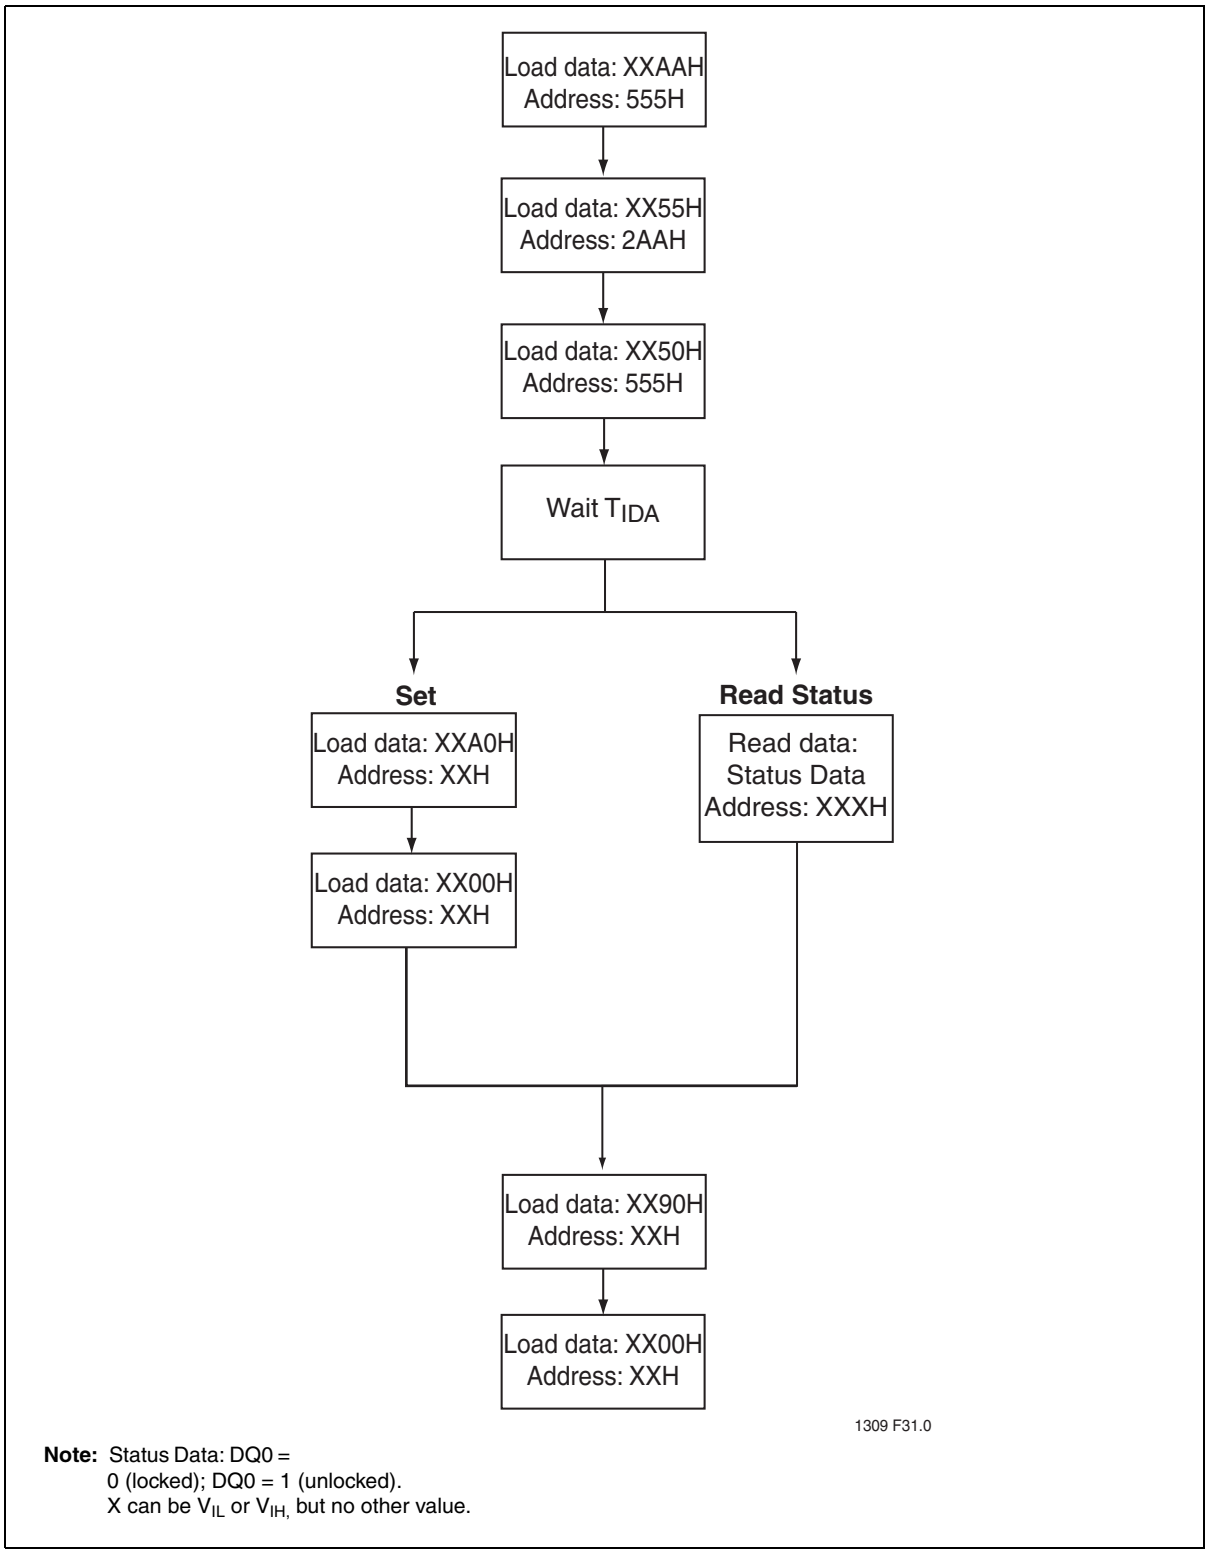
Note: Data = 00H (unprotect);
Data = 01H (protect).
BA = Block Address
X can be V_{IL} or V_{IH}, but no other value.

Figure 31: Volatile Block Protection



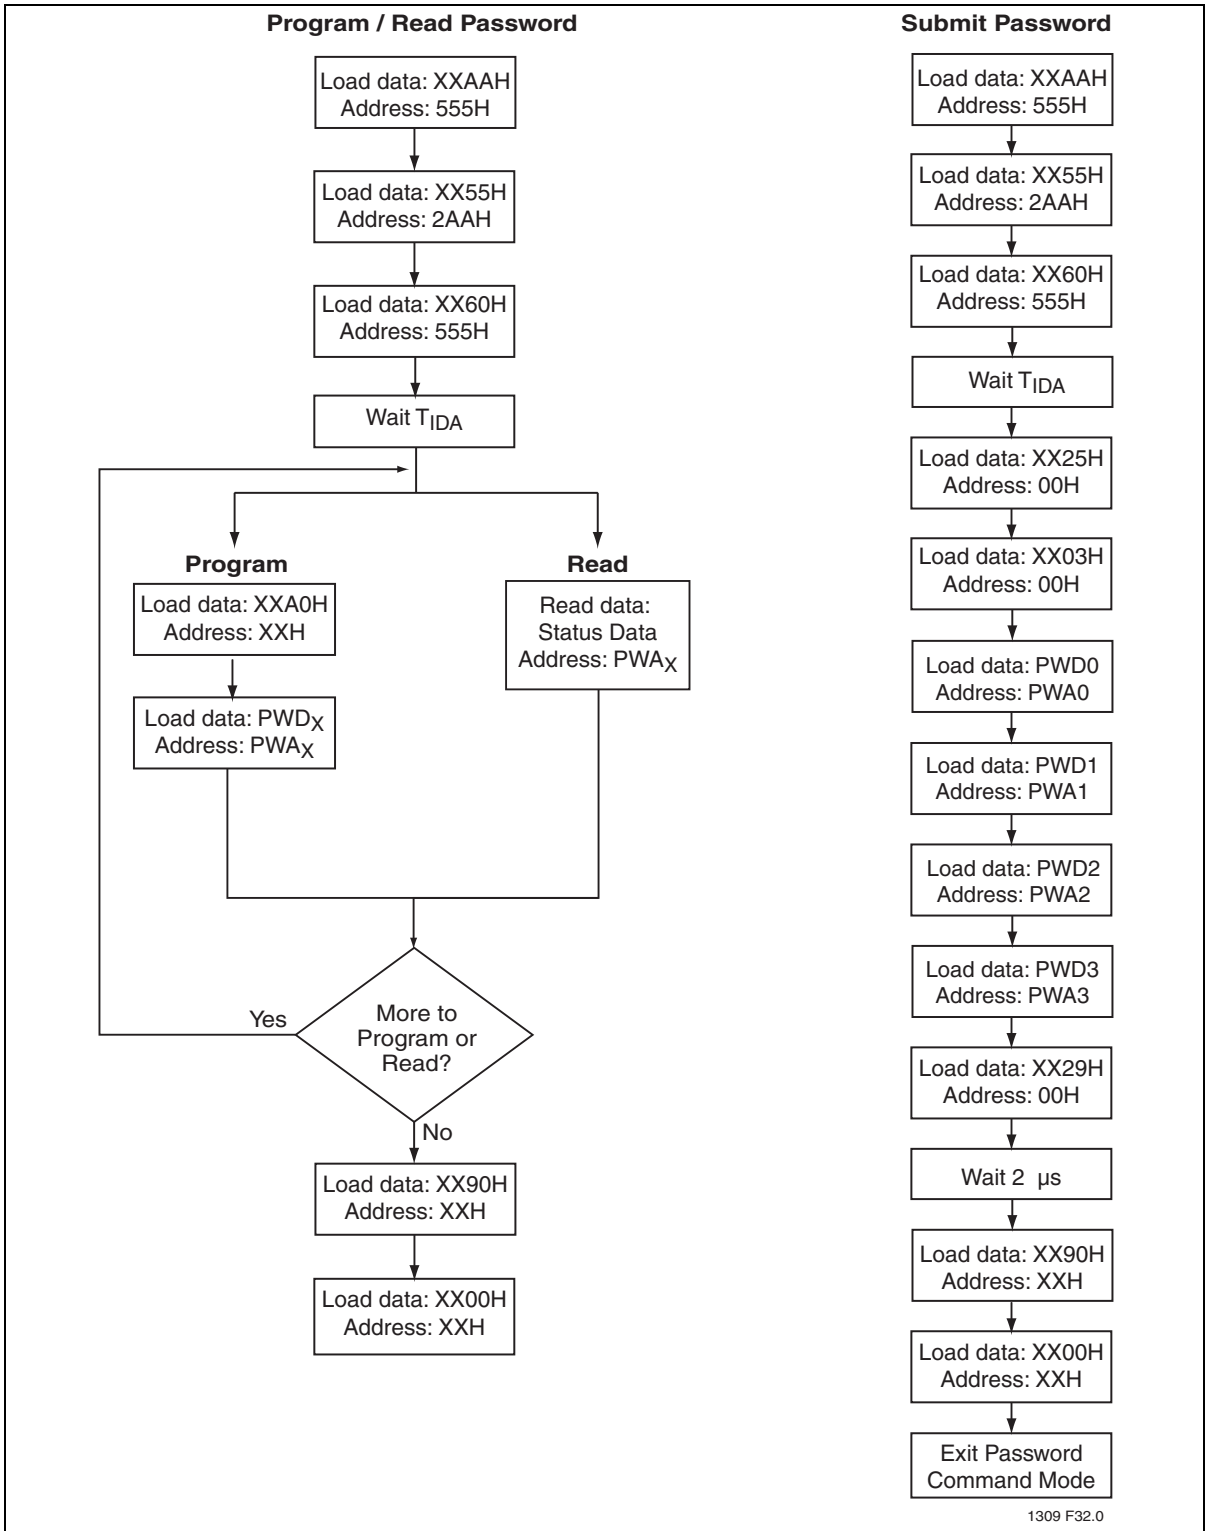
Note: Data = 00H (unprotect);
Data = 01H (protect).
X can be V_{IL} or V_{IH}, but no other value.

Figure 32: Non-Volatile Block Protect Mode



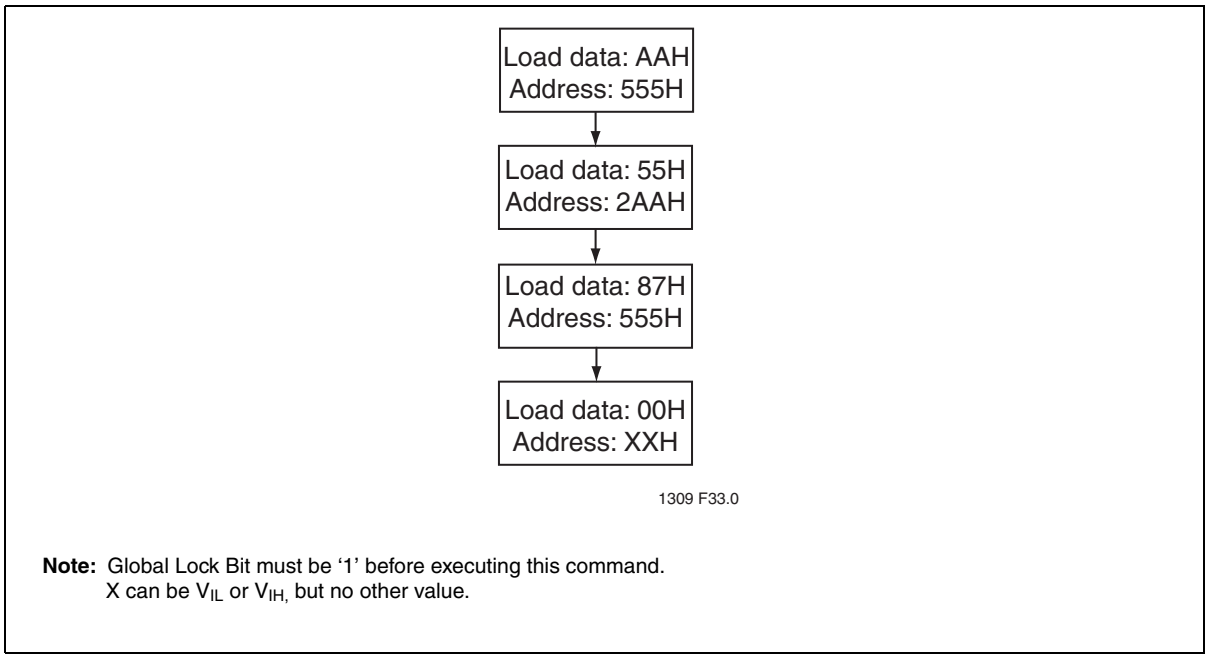
Note: Status Data: DQ0 =
0 (locked); DQ0 = 1 (unlocked).
X can be V_{IL} or V_{IH}, but no other value.

Figure 33: Global Lock of NVPBs



Note: The PWDX and PWAX data and address pairs can be submitted in any order.

Figure 34: Password Operations (Program, Read, Submit)



Note: Global Lock Bit must be '1' before executing this command.
X can be V_{IL} or V_{IH}, but no other value.

Figure 35: Irreversible Block Lock in Main Array

Not Recommended for New Designs

Product Ordering Information

SST 38 VF 6401 - 90 - 5C - EKE
XX XX XXXX - XX - XX - XXX

Environmental Attribute
E[1] = non-Pb

Package Modifier
K = 48 balls or leads

Package Type
E = TSOP (type1, die up, 12mm x 20mm)
B3 = TFBGA (6mm x 8mm, 0.8mm pitch)

Temperature Range
C = Commercial = 0°C to +70°C
I = Industrial = -40°C to +85°C

Minimum Endurance
5 = 100,000 cycles

Read Access Speed
90 = 90 ns

Hardware Block Protection
1 = Bottom Boot-Block Uniform (32 KWord)
2 = Top Boot-Block Uniform (32 KWord)
3 = Bottom Boot-Block Non-Uniform(8 KWord)
4 = Top Boot-Block Non-Uniform (8 KWord)

Device Density
640 = 64 Mbit

Voltage
V = 2.7-3.6V

Product Series
38 = Advanced Multi-Purpose Flash Plus

1. Environmental suffix “E” denotes non-Pb solder. non-Pb solder devices are “RoHS Compliant”.

Not Recommended for New Designs

Valid Combinations for SST38VF6401

SST38VF6401-90-5C-EKE	SST38VF6401-90-5C-B3KE
SST38VF6401-90-5I-EKE	SST38VF6401-90-5I-B3KE

Valid Combinations for SST38VF6402

SST38VF6402-90-5C-EKE	SST38VF6402-90-5C-B3KE
SST38VF6402-90-5I-EKE	SST38VF6402-90-5I-B3KE

Valid Combinations for SST38VF6403

SST38VF6403-90-5C-EKE	SST38VF6403-90-5C-B3KE
SST38VF6403-90-5I-EKE	SST38VF6403-90-5I-B3KE

Valid Combinations for SST38VF6404

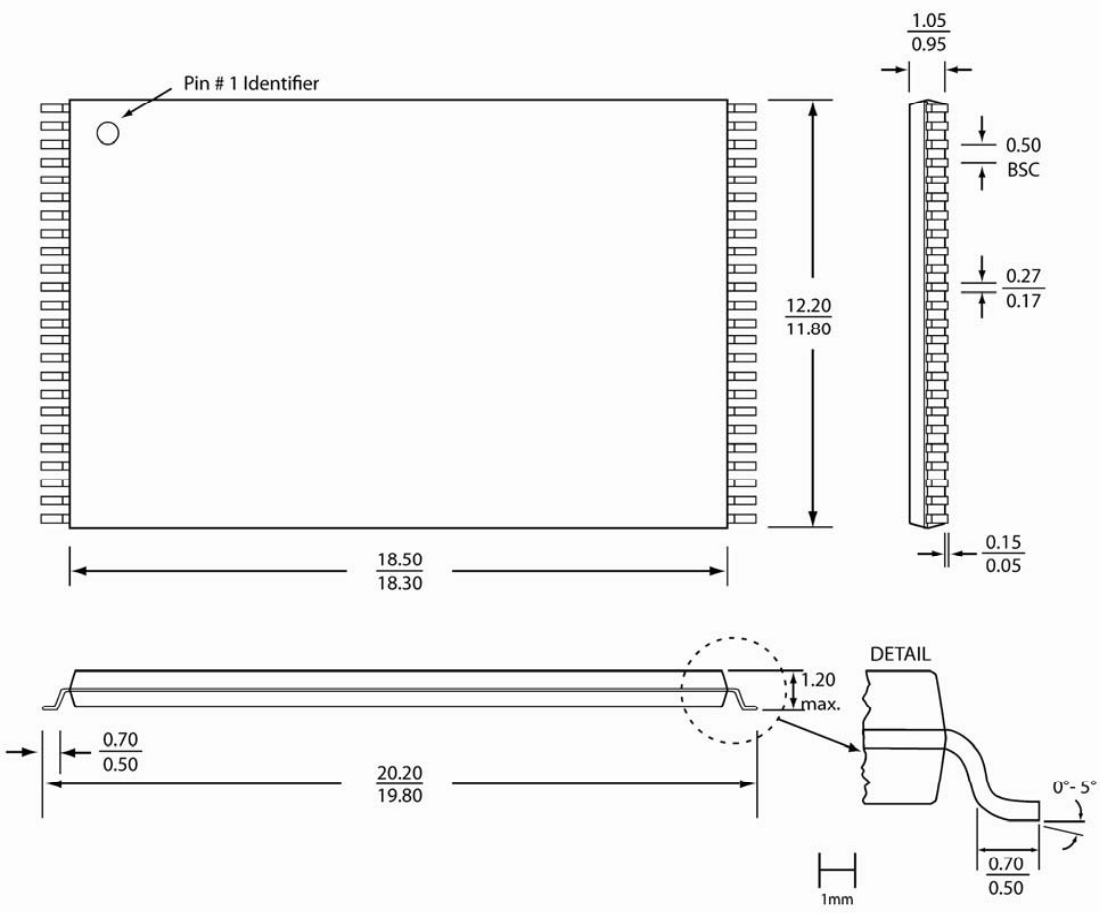
SST38VF6404-90-5C-EKE	SST38VF6404-90-5C-B3KE
SST38VF6404-90-5I-EKE	SST38VF6404-90-5I-B3KE

Note: Valid combinations are those products in mass production or will be in mass production. Consult your sales representative to confirm availability of valid combinations and to determine availability of new combinations.

Packaging Diagrams

48-Lead Thin Small Outline Package (EKE/F) - [TSOP]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



48-tsop-EK-8

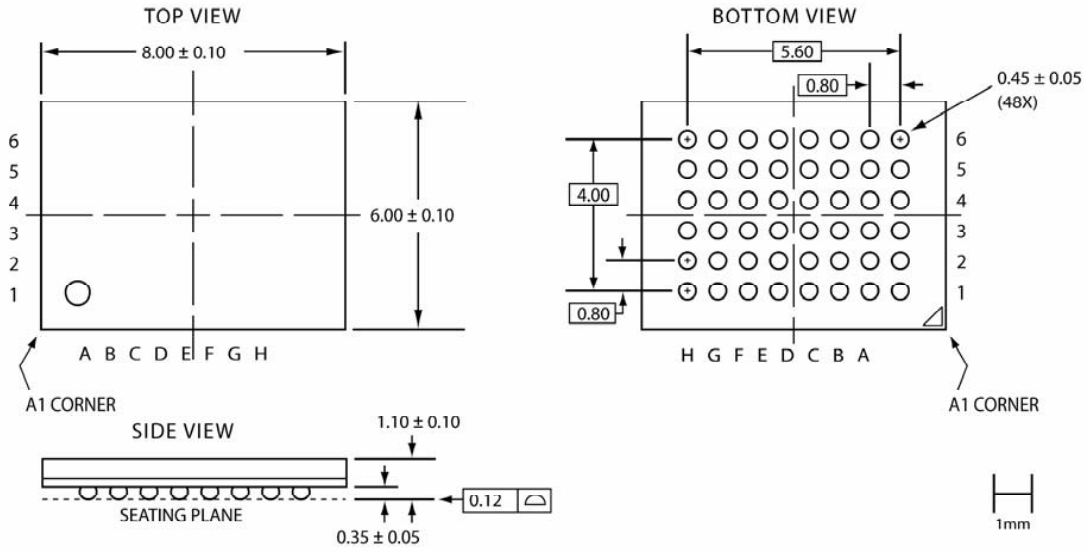
Note:
1. Complies with JE DEC publication 95 MO-142 DD dimensions, although some dimensions may be more stringent.
2. All linear dimensions are in millimeters (max/min).
3. Coplanarity: 0.1 mm
4. Maximum allowable mold flash is 0.15 mm at the package ends, and 0.25 mm between leads.

Microchip Technology Drawing C04-14036A Sheet 1 of 1

Figure 36: 48-lead Thin Small Outline Package (TSOP) 12mm x 20mm
Package Code: EKE

48-Lead Thin Fine-Pitch Ball Grid Array (B3KE/F) - 6x8 mm Body [TFBGA]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



48-tfbga-B3K-6x8-450mic-5

Note:

1. Complies with JEDEC Publication 95, MO-210, variant 'AB-1', although some dimensions may be more stringent.
2. All linear dimensions are in millimeters.
3. Coplanarity: 0.12 mm
4. Ball opening size is 0.38 mm (± 0.05 mm)

Microchip Technology Drawing C04-14035A Sheet 1 of 1

Package Code: B3KE

Table 25: Revision History

Number	Description	Date
00	• Initial release	Mar 2007
01	• Removed Program Suspend/Resume on page 10 • Updated “Erase-Suspend/Erase-Resume Commands” on page 11 • Updated “Non-Volatile Block Protection” on page 19 • Updated “Password Mode (DQ_2, DQ_1 = 0,1)” on page 20 • Updated “Power-Up Specifications” on page 32 • Added a note to Figure 32 on page 56 • Updated “Product Ordering Information” on page 60	Sep 2007
02	• Modified Features and Product Description on page 1	Dec 2007
03	• Revised endurance statement in Features, Product Description and Table 20 footnote • Updated “Product Ordering Information” on page 60 • Changed document status to “Preliminary Specification”	Aug 2008
04	• Changed 1V per 100 µs to 1V per 100 ms in Power Up Specification on page 26	Jan 2009
05	• EOL of all 10,000 cycle endurance products. All 10,000 cycle endurance products removed. See S71309(01). • Changed document status to “Data Sheet”	Jul 2009
A	• Applied new document format • Released document under letter-revision system • Updated Spec Number from S71309 to DS-25015	Apr 2011
B	• Document marked “Not Recommended for New Designs.”	Aug 2015

ISBN:978-1-63277-711-9
