# SGS-THOMSON MICROELECTRONICS

STV5348/C

CYRILLIC TELETEXT AND PDC/VPS DECODER WITH 8 INTEGRATED PAGES

- COMPLETE TELETEXT AND VPS DECODER INCLUDING AN 8 PAGE MEMORY ON A SINGLE CHIP
- PIN TO PIN COMPATIBLE WITH STV5348 (OR STV5348D)
- PERFORM PDC SYSTEM A (VPS) AND PDC SYSTEM B (8/30/2) DATA STORAGE SEPARATLY
- DEDICATED "ERROR FREE" OUTPUT FOR VALID PDC DATA
- INDICATION OF LINE 23 FOR EXTERNAL USE
- SINGLE +5V SUPPLY VOLTAGE
- SINGLE 13.875MHz CRYSTAL
- REDUCED SET OF EXTERNAL COMPONENTS, NO EXTERNAL ADJUSTMENT
- OPTIMIZED NUMBER OF DIGITAL SIGNALS REDUCING EMC RADIATION
- HIGH DENSITY CMOS TECHNOLOGY
- DIGITAL DATA SLICER AND DISPLAY CLOCK PHASE LOCK LOOP
- RUSSIAN AND UKRANISH CHARACTER SET
- 28 PIN DIP & SO PACKAGE

DIP28
(Plastic Package)

ORDER CODE : STV5348/C

SO28
(Plastic Package)

ORDER CODE : STV5348D/C
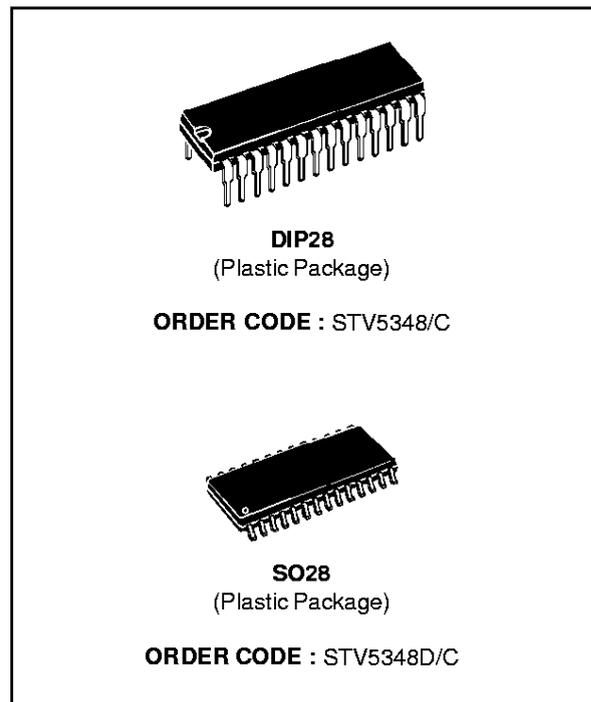

DESCRIPTION

The STV5348 decoder is a computer-controlled teletext device including an 8 page internal memory. Data slicing and capturing extracts the teletext information embedded in the composite video signal. Control is accomplished via a two wire serial I²C bus . Chip address is 22h. Internal ROM provides a character set suitable to display text using Cyrillic or Ukranish characters. Hardware and software features allow selectable master/slave synchronization configurations. The STV5348 also supports facilities for reception and display of current level protocol data.

PIN CONNECTIONS

CVBS	1	28	CBLK
MA/SL	2	27	TEST

APPLICATION DIAGRAM

* Value according to used crystal, C1 = C2 = 2 * C$_{LOAD}$
  Example : C1 = C2 = 56pF, C$_{LOAD}$ = 30pF.
** Depending on application. Please refer to our video application lab.
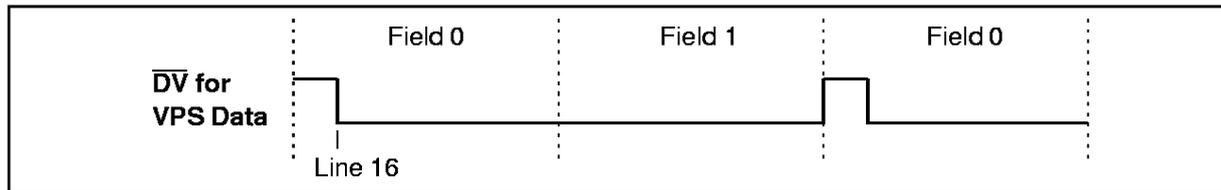

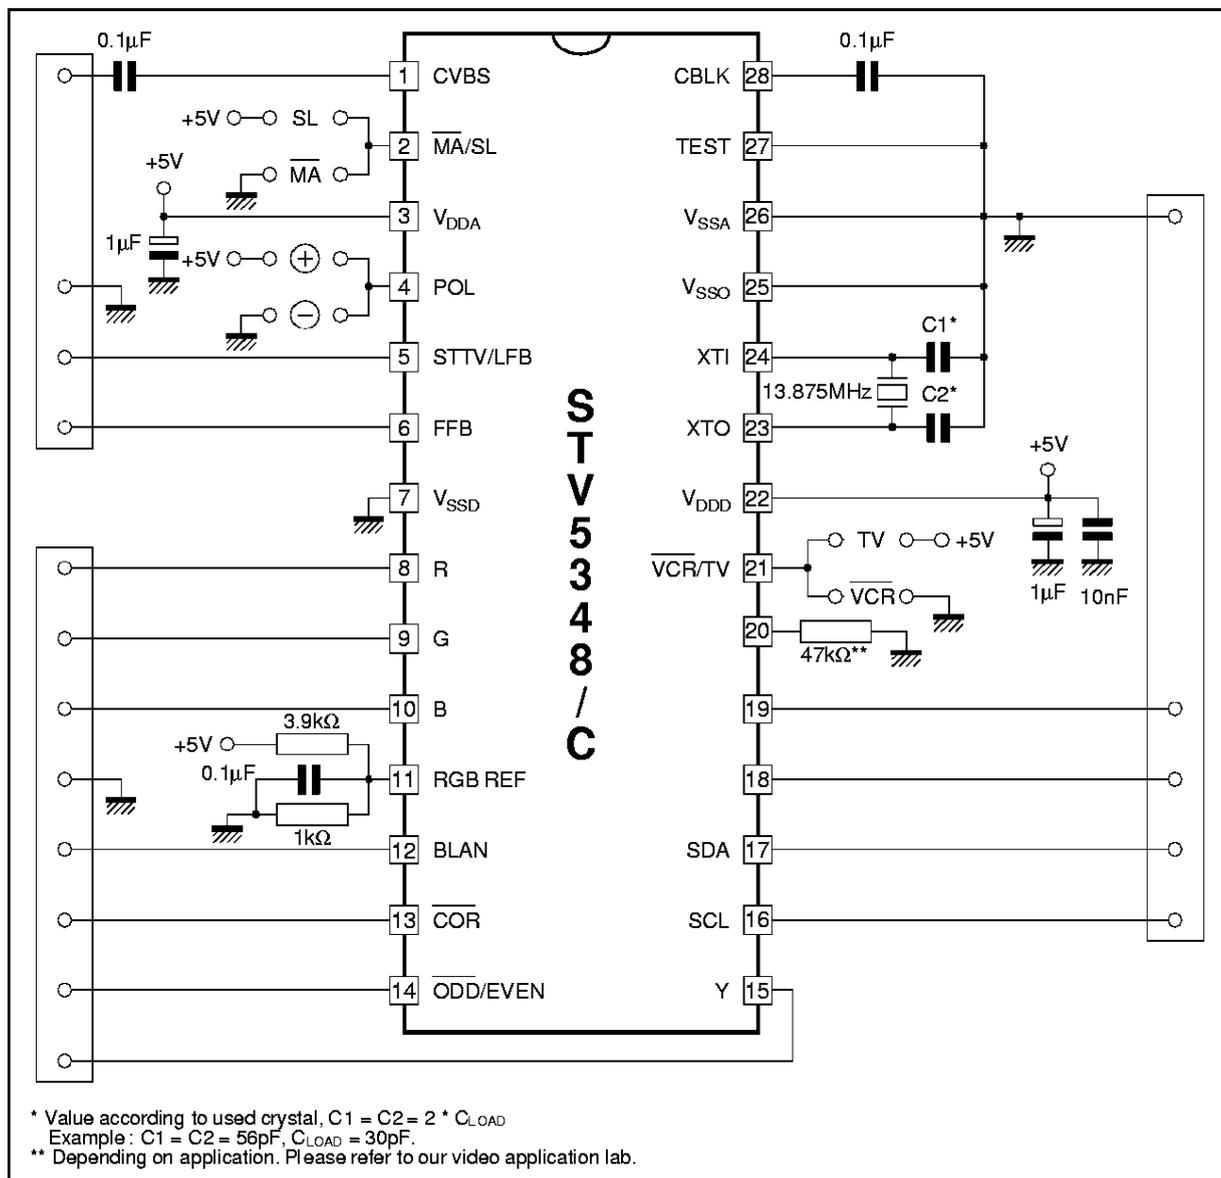

Remark : all the power supply inputs must be switched on at the same time (connected to the same source).

SGS-THOMSON
MICROELECTRONICS

FUNCTIONAL DESCRIPTION

I - Displayable Page Memory Map

The organization of a page-memory is shown in Figure 7.

The display area consists of 25 rows of 40 characters per row.

The organization is as follows :

- Row zero contains the page header :
  - The first seven characters (0 - 6) are used for messages regarding the operational status.
  - The eighth character is an alphanumeric control character either "white" or "green" defining the "search" status of the page. When it is "white" the operational state is normal and the header appears white ; when it is "green" the opera-

tional state corresponds to the "search mode" and the header appears green.
  - The following twenty-four characters give the header of the requested page when the system is in search mode.
  - The last eight characters display the time of day.

- Row number twenty-four is used by the microprocessor for the display of information, or used to display X/24 colored key data according to R0D7 bit.
- Row twenty-five comprises ten bytes of control data concerning the received page (see Table 1) and fourteen free bytes which can be used by the microprocessor.

COLUMN	0	1	2	3	4	5	6	7	8	9

Page number : - MAG = magazine, PU = page units, PT = page tens.
Page sub-code : - MU = minutes units, MT = minutes tens, HU = hours units, HT = hours tens.
PBLF = page being looked for, $\overline{FOUND}$ = low for page found, HAM = hamming error in byte, C4-14 = control bits.

FUNCTIONAL DESCRIPTION (continued)

III - VPS DATA (see Table 2)

VPS data are stored in row 25 chapter 5 as shown in Table 2 when VPS enable bit (D4 of R8 register) is set. VPS data bits are decoded and stored in a received area with biphase error bit.

8/30/2 data are stored as received (without hamming decoding) in Row 23 chapter 5 according to Table 2. .

8/30 packet and VPS data decoding is the responsibility of the control software. The decoder simply stores transmitted data.

IV - I²C Bus Register Map (see Table 3)

Registers R0 to R10 are write only whilst R11A is a read/write and R11B is read only.

The automatic succession on a byte by byte basis is indicated by the arrows in Table 3.

In the normal operating mode TB should be set to logic level 0.

After power-up the contents of the registers are as follows : all bits in registers R0 to R11A are cleared to zero with the exception of bits D0 and D1 in registers R5 and R6 which are set to logical one.

After power-up all the memory bytes are preset to hexadecimal value 20H (space) with the exception of the byte corresponding to row 0 of column 7 of chapter 0 which is set to the value corresponding to "alpha white" hexadecimal value 07H.

FUNCTIONAL DESCRIPTION (continued)

IV - I^{2}C Bus Register Map (continued)
IV.1 - Registers Functions

Register	Function	Bit(s)	Description
R0 Address 00H	R11 adressing and pin functions control	SEL 11B (D0)	Selection of register 11B (D0 = 1) or 11A (D0 = 0)
		EVEN OFF (D2)	Control of ODD/EVEN pin : EVEN signal output (D2 = 0) or grounded (D2 = 1)
		DISABLE ROLLING HEADER	D4 = 1, Disable rolling header D4 = 0, Normal operation
		FREE RUNNING PLL (D6)	D6 = 0, PLL locks on line frequency D6 = 1, to force free running mode
		X/24 POSITION (D7)	D7 = 0, packet X/24 stored to chapter 4 to 7/row 20 D7 = 1, packet X/24 stored to chapter 0 to 3/row 24
R1 Address 01H	Operating mode controls	T1 (D1) T0 (D0) 0 0 0 1 1 0 1 1	Character display line control : 312.5/312.5 line MIX - mode with interlace 312/313 line TEXT - mode without interlace 312/312 line Terminal mode without interlace External synchronization. SCS mode (scan field synchro)
		TCS ON (D2)	Master Mode (MA/SL Pin 2 = 0) case POL Pin 4 = 0 D2 = 0, Pin 5 = VCS D2 = 1, Pin 5 = TCS Slave Mode (MA/SL Pin 2 = V$_{DD}$) No effect
		DEW / FULLFIELD (D3)	Selection of field flyback mode or full channel mode (D3 = 1) for recovering of Teletext data.
		GHOST ROW ENABLE (D4)	Selection of ghost row mode (D4 = 1)
		ACQUISITION ON / OFF (D5)	Control of acquisition operation (D5 = 0 enables acquisition)
		7 bits + parity or 8 bits without parity (D6)	Selection of received data format either 7 bits with parity (D6 = 0) or 8 bits without parity (D6 = 1).
R2 Address 02H	Addressing information for a page request	SC0, SC1, SC2 (D0, D1, D2)	Address the first column of the on chip page request RAM to be written.
		TB (D3)	Test bit equal to "0" in the normal working mode.
		A0, A1 (D4, D5)	Address a group of four consecutive pages currently used for data acquisition.
		A2 (D6)	Address of one of the two groups of four pages for acquisition in normal mode.
R3 Address 03H	Data relative to the requested page (see Table 3)	PRD0 - PRD4 (D0 - D4)	Written data in the page request RAM, starting with the columns addressed by SC0,SC1,SC2.
R4 Address 04H	Selection of one of eight pages to display	A0, A1, A2 (D0, D1, D2)	Chapter selection.
R5 Address 05H	Display control for normal operation	PON (D0, D1)	Picture on (IN: D0, OUT: D1)
		TEXT (D2, D3)	Text on (IN: D2, OUT: D3)
		COR (D4, D5)	Contrast reduction on (IN: D4, OUT: D5)
		BKGND (D6, D7)	Background color on (IN: D6, OUT: D7)
		IN / OUT	Enable inside/outside the box
R6 Address 06H	Display control for news-flash subtitle generation	See R5	See R5

FUNCTIONAL DESCRIPTION (continued)

IV - I²C Bus Register Map (continued)
IV.1 - Registers Functions (continued)

Register	Function	Bit(s)	Description
R7 Address 07H	Display mode	BOX ON 0, 1-23,24 (D0, D1, D2)	The "boxing" function is enabled on row 0,1-23 and 24 by D0, D1 and D2 set to one.
		TOP / BOTTOM Single/ Double Height (D4/D3)	X0 = Normal 01 = double height Rows 0 to 11 11 = double height Rows 12 to 23
		Conceal / Reveal (D5)	Conceal Reveal Function
		Cursor ON/OFF (D6)	Cursor position given by row/column value of R9/R10
		STATUS ROW BTM / TOP (D7)	The row 24 is displayed before the "Main text Area" (lines 0-23) or after (D7 = 0).
R8	Memory access	VPS Enable (D4)	D4 = 1 Enable VPS acquisition and DV signal output.
		Clear Memory (D3)	D4 = 1 Clear memory. Chapter selected with A2A1A0 (D2, D1, D0) R4.
		Chapter Address (D2, D1, D0)	Chapter selection
R9 to R11A Address 08H to 0BH*			Active row address (R9), active column address (R10). Data contained in R11A read (written) from (to) memory by microprocessor via I²C.
R11B Address 0BH*	Status	VCS QUAL (D0)	Good VCS quality signal detected (D0 = 1). Bad VCS quality signal detected (D0 = 0).
		DATA QUAL (D1)	Good TELETEXT signal (D1 = 1). Bad TELETEXT signal (D1 = 0).
		50/60Hz (D7)	If D1 = 0 frame frequency is 50Hz (only valid with good VCS)

5348C-09.TBL

* Reading of R11A or R11B is determined by register 0, bit D0. However, write operation is always performed on R11A register.

Table 4 : Register R3

START COLUMN	PRD4	PRD3	PRD2	PRD1	PRD0
0	Do care magazine	HOLD	MAG2	MAG1	MAG0
1	Do care page tens	PT3	PT2	PT1	PT0
2	Do care page units	PU3	PU2	PU1	PU0
3	Do care hours tens	X	X	HT1	HT0
4	Do care hours units	HU3	HU2	HU1	HU0
5	Do care minutes tens	X	MT2	MT1	MT0
6	Do care minutes units	MU3	MU2	MU1	MU0

The abbreviations have the same significance as in Table 1 with the exception of the "DO CARE" entries. It is only when this bit is "1" that the corresponding digit is taken into consideration on page request. For example, a page defined as "normal" or one defined as "timed" may be selected.

If "HOLD" is low the page is held. The addressing of successive bytes via the I²C is automatic.

5348C-10.TBL

V - Character Sets

The complete character set with 8-bit decoding is given in Table 5.

Characters in columns 0 and 1 are normally displayed as blanks. Black dots represent the character shape whereas white dots represent the background.

Each character can be identified by a pair of corresponding row and column integers : for example the character "3" may be indicated by 3/3.

A rectangle may be represented as follows : ⬜

The characters 8/6, 8/7, 9/5, 9/7 are used as special characters, always in conjunction with 8/5.
The 13 national characters are placed in columns with bit 8 = 0.
