

5V/3.3V TRIPLE ECL/LVECL-TO-PECL/LVPECL TRANSLATOR

SY100EL90V

FEATURES

- 3.3V and 5V power supply options
- 500ps propagation delay
- Fully differential design
- Supports both standard and low voltage operation
- Available in 20-pin SOIC package

DESCRIPTION

The SY100EL90V is a triple ECL/LVECL-to-PECL/LVPECL translator. The device can translate over all combinations of supply voltages: -5V ECL to 5V PECL, -5V ECL to 3.3V LVPECL, -3.3V LVECL to 5V PECL or -3.3V LVECL to 3.3V LVPECL.

A V_{BB} output is provided for interfacing with single ended ECL signals at the input. If a single ended input is to be used, the V_{BB} output should be connected to the $\bar{D}$ input. The active signal would then drive the D input. When used, the V_{BB} output should be bypassed to via a 0.01 μ F capacitor. The V_{BB} output is designed to act as the switching reference for the EL90V under single ended input switching conditions. As a result this pin can only source/sink up to 0.5mA of current.

To accomplish the level translation the EL90V requires three power rails. The V_{CC} supply should be connected to the positive supply, and the V_{EE} pin should be connected to the negative power supply. The GND pins as expected are connected to the system ground plane. Both V_{EE} and V_{CC} should be bypassed to ground via 0.01 μ F capacitors.

Under open input conditions, the $\bar{D}$ input will be biased at $V_{CC}/2$ and the D input will be pulled to V_{EE} . This condition will force the Q output to a LOW, ensuring stability.

FUNCTION TABLE

Function	V _{CC}	GND	V _{EE}
-5V ECL to 5V PECL	5V	0V	-5V
-5V ECL to 3.3V LVPECL	3.3V	0V	-5V
-3.3V LVECL to 5V PECL	5V	0V	-3.3V
-3.3V LVECL to 3.3V LVPECL	3.3V	0V	-3.3V

PIN NAMES

Pin	Function
D _n	ECL/LVECL Inputs
Q _n	PECL/LVPECL Outputs
V _{BB}	ECL/LVECL Reference Voltage Output

t_r t_f	Output Rise/Fall Times Q (20% to 80%)	230	—	500	230	—	500	230	—	500	230	—	500	ps

Notes:

1. Skew is measured between outputs under identical transitions.
2. Minimum input swing for which AC parameters are guaranteed. The device will function reliably with differential inputs down to 100mV.
3. The CMR range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between V_{PP} min. and 1V. V_{CMR} min. depends on V_{EE} , V_{PP} and temperature at $V_{PP} < 500mV$ and $-40^\circ C$, V_{CMR} is $V_{EE}+1.3V$; and for $0-85^\circ C$, V_{CMR} is $V_{EE}+1.2V$. At $V_{PP} \geq 500mV$ and $-40^\circ C$, V_{CMR} is $V_{EE}+1.5V$; and for $0-85^\circ C$, V_{CMR} is $V_{EE}+1.4V$.
