

FEATURES

- Single 3.3V or 5V power supply
- Up to 3.2Gbps operation
- Low noise PECL data outputs
- Chatter-free open collector TTL LOS output
- TTL /EN Input
- Differential PECL inputs for data
- Available in a tiny 10-pin (3mm) MSOP and 10-pin (3mm) EPAD-MSOP

APPLICATIONS

- 1.25Gbps and 2.5Gbps Gigabit Ethernet
- 531Mbps, 1062Mbps and 2.12Gbps Fibre Channel
- 622Mbps SONET
- Gigabit interface converter
- 2.5Gbps SDH/SONET
- 2.5Gbps proprietary links
- Parallel 10G Ethernet

DESCRIPTION

The SY88923AV limiting post amplifier with its high gain and wide bandwidth is ideal for use as a post amplifier in fiber-optic receivers with data rates up to 3.2Gbps. Signals as small as 5mV_{PP} can be amplified to drive devices with PECL inputs. The SY88923AV generates a chatter-free Loss-of-Signal (LOS) open collector TTL output.

The SY88923AV incorporates a programmable level detect function to identify when the input signal has been lost. The LOS output will change from logic "LOW" to logic "HIGH" when input signal is smaller than the swing set by LOS_{LVL}. This information can be fed back to the EN input of the device to maintain stability under loss-of-signal condition. Using LOS_{LVL} pin, the sensitivity of the level detection can be adjusted. The LOS_{LVL} voltage can be set by connecting a resistor divider between V_{CC} and V_{REF} shown in Figure 3. "Typical Operating Characteristics" on page 6 show the relationship between input level sensitivity and the voltage set on LOS_{LVL}.

The LOS output is a TTL open collector output that requires a pull-up resistor for proper operation, Figure 1.

Notes:

1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. The device is guaranteed to meet the DC specifications, shown in the table above, after thermal equilibrium has been established. The device is tested in a socket such that transverse airflow of ≥ 500 fpm is maintained.

GENERAL DESCRIPTION

General

The SY88923AV is an integrated limiting amplifier intended for high-frequency fiber-optic applications. The circuit connects to typical trans-impedance amplifiers found within a fiber-optics link. The linear signal output from a trans-impedance amplifier can contain significant amounts

of noise, and may vary in amplitude over time. The SY88923AV limiting amplifier quantizes the signal and outputs a voltage-limited waveform.

The /EN pin allows the user to disable the output signal without removing the input signal.

DESIGN PROCEDURE

Output Termination

The SY88923AV outputs must be terminated with a 50Ω load to $V_{CC} - 2V$ (or Thevenin equivalent).

Layout and PCB Design

Since the SY88923AV is a high-frequency component, performance can largely be determined by board layout and design. A common problem with high-gain amplifiers is feedback from the large swing outputs to the input via the power supply.

Figure 2. Differential Input Configuration

The SY88923AV ground pin should be connected to the circuit board ground. Use multiple PCB vias close to the part to connect to ground. Avoid long, inductive runs which can degrade performance.

Figure 3. LOS_{LVL} Circuit

Note 1.
$$LOS_{LVL} = V_{CC} - 1.32V + \frac{R2 \times 1.32V}{R1 + R2}$$

$$R1 + R2 \geq 2.6k\Omega$$
