

FEATURES

- Selects among four differential inputs
- Guaranteed AC performance over temp and voltage:
 - DC-to > 3.2Gbps data rate throughput
 - < 600ps In-to-Out t_{pd}
 - < 150ps t_r/t_f
- Ultra-low jitter design:
 - < 1ps_{RMS} random jitter
 - < 10ps_{PP} deterministic jitter
 - < 10ps_{PP} total jitter (clock)
 - < 0.7ps_{RMS} crosstalk-induced jitter
- Unique input isolation design minimizes crosstalk
- Internal input termination
- Unique input termination and V_T pin accepts DC-coupled and AC-coupled inputs (LVDS, LVPECL, CML)
- 350mV LVDS output swing
- CMOS/TTL compatible MUX select
- Power supply 3.3V +10%
- -40°C to +85°C temperature range
- Available in 32-pin (5mm x 5mm) MLF® package

APPLICATIONS

- SONET/SDH channel select applications
- Fiber Channel multi-channel select applications
- Gigabit Ethernet multi-channel select

TYPICAL PERFORMANCE

Precision Edge®

DESCRIPTION

The SY89545L is a fast, low jitter 4:1 differential MUX with an LVDS (350mV) compatible output with guaranteed data rate throughput of 3.2Gbps over temperature and voltage.

The SY89545L differential inputs include a unique, 3-pin internal termination that allows access to the termination network through a V_T pin. This feature allows the device to easily interface to different logic standards, both AC- and DC-coupled without external resistor-bias and termination networks. The result is a clean, stub-free, low jitter interface solution.

The SY89545L operates from a single 3.3V supply, and is guaranteed over the full industrial temperature range (-40°C to +85°C). For applications that require a 2.5V supply, consider the SY89544U. For applications that require two differential outputs, consider the SY89546U or SY89545L. The SY89545L is part of a Micrel's Precision Edge® product family. All support documentation can be found on Micrel's web site at www.micrel.com.

PIN DESCRIPTION

Pin Number	Pin Name	Pin Function
4, 2, 32, 30, 27, 25, 23, 21	IN0, /IN0, IN1, /IN1, IN2, /IN2, IN3, /IN3	Differential Inputs: These input pairs are the differential signal inputs to the device. Inputs accept AC- or DC-coupled signals as small as 100mV. Each pin of a pair internally terminates to a V_T pin through 50Ω . Note that these inputs will default to an indeterminate state if left open. Unused differential input pairs can be terminated by connecting one input to V_{CC} and the complementary input to GND through a $1k\Omega$ resistor. The V_T pin is to be left open in this configuration. Please refer to the "Input Interface Applications" section for more details.
3, 31, 26, 22	VT0, VT1, VT2, VT3	Input Termination Center-Tap: Each side of the differential input pair, terminates to a V_T pin. The V_{T0} , V_{T1} , V_{T2} , V_{T3} pins provide a center-tap to a termination network for maximum interface flexibility. See "Input Interface Applications" section for more details.
6, 19	SEL0, SEL1	These single-ended TTL/CMOS compatible inputs select the inputs to the multiplexers. Note that these inputs are internally connected to a $25k\Omega$ pull-up resistor and will default to a logic HIGH state if left open.
1, 5, 8, 17, 20, 24, 28, 29	VCC	Positive Power Supply: Bypass with $0.1\mu\text{F} \parallel 0.01\mu\text{F}$ low ESR capacitors. The $0.01\mu\text{F}$ capacitor should be as close to V_{CC} pin as possible.
10, 11	Q, /Q	Differential Outputs: This LVDS output pair is the output of the device. It is a logic function of the IN0, IN1, IN0, IN1 and SEL0 inputs. Please refer to the "Truth Table" for details.
7, 9, 12, 13, 16, 18	GND, Exposed pad	Ground: Ground pin and exposed pad must be connected to the same ground plane.
14, 15	NC	No connect. (Unused pins).

Notes:

1. Permanent device damage may occur if "Absolute Maximum Ratings" are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to "Absolute Maximum Ratings" conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Due to the limited drive capability use for input of the same package only.
4. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB. Ψ_{JB} uses 4-layer θ_{JA} in still air unless otherwise stated.
5. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
6. Includes current through internal 50 Ω pull-ups.
7. See "Operating Characteristics" section for V_{IN} and V_{DIFF_IN} definition.

Notes:

10. Measured with 100mV input swing. See "Timing Diagrams" section for definition of parameters. High frequency AC-parameters are guaranteed by design and characterization.
11. Input-to-input skew is the difference in propagation delay between any two inputs to the output under identical conditions.
12. Part-to-part skew is defined for two parts with identical power supply voltages at the same temperature and with no skew of the edges at the respective inputs.
13. RJ is measured with a K28.7 comma detect character pattern, measured at 1.25Gbps and 3.2Gbps.
14. DJ is measured at 1.25Gbps and 3.2Gbps, with both K28.5 and 2²³-1 PRBS pattern.
15. Total jitter definition: with an ideal clock input of frequency $\leq f_{MAX}$, no more than one output edge in 10¹² output edges will deviate by more than the specified peak-to-peak jitter value.
16. Cycle-to-cycle jitter definition: the variation of periods between adjacent cycles, $T_n - T_{n-1}$ where T is the time between rising edges of the output signal.
17. Crosstalk is measured at the output while applying two similar frequencies to adjacent inputs that are asynchronous with respect to each other at the inputs.

OUTPUT INTERFACE APPLICATIONS

LVDS specifies a small swing of 350mV typical, on a nominal 1.25V common mode above ground. The common mode voltage has tight limits to permit large variations in

ground between an LVDS driver and receiver. Also, change in common mode voltage, as a function of data input, is kept to a minimum, to keep EMI low.
