

## High Accuracy Low Dropout Voltage Tracking Regulator

TLE4254

## 1 Overview

### Features

- 70 mA output current capability
- Very tight output tracking tolerance to reference
- Output voltage adjustable down to 2.0 V
- Stable operation with 1  $\mu$ F ceramic output capacitor
- Flexibility of output voltage adjust higher or lower than reference, proportional to the reference voltage (version GA / EJ A)
- Status output to indicate short circuits at the output (version GS / EJ S)
- Very low dropout voltage of typ. 0.2 V @ maximum output current
- Combined reference / enable input
- Very low current consumption in OFF mode
- Wide input voltage range  $-20 \text{ V} \leq V_i \leq +45 \text{ V}$
- Wide temperature range:  $-40 \text{ }^{\circ}\text{C} \leq T_j \leq 150 \text{ }^{\circ}\text{C}$
- Output protected against short circuit to GND and battery
- Input protected against reverse polarity
- Overtemperature protection
- Green product (RoHS compliant)
- AEC qualified

### Functional Description

The TLE4254 is a monolithic integrated low-dropout voltage tracking regulator with high accuracy in small PG-DSO-8 packages. The IC is designed to supply off-board systems, e. g. sensors in powertrain management systems under the severe conditions of automotive applications. Therefore, the IC is equipped with additional protection functions against reverse polarity and short circuit to GND and battery.

With supply voltages up to 40 V, the output voltage follows a reference voltage applied at the adjust input with very high accuracy. The reference voltage applied directly to the adjust input or by an e. g. external resistor divider can be 2.0 V at minimum.

The output is able to drive loads up to 70 mA while the device follows with high accuracy the e. g. 5 V output of a main voltage regulator acting as reference.

**Overview**

The TLE4254 can be set into shutdown mode in order to reduce the current consumption to a minimum. This suits the IC for low power battery applications.

Versions "GS" and "EJ S" offer an open collector status output indicating an overvoltage and undervoltage error condition of the output voltage.

Versions "GA" and "EJ A" allow setting the output voltage to higher value than the reference voltage by connecting a voltage divider to the feedback pin "FB".

Pin	Symbol	Function
1	Q	<b>Tracker Output.</b> Block to GND with a capacitor close to the IC terminals, respecting capacitance and ESR requirements given in the table "Functional Range".
2, 3, 6, 7	GND	<b>Ground reference.</b> Interconnect the pins on PCB. Connect to heatsink area.
4	FB (version GA)	<b>Feedback input (version GA only).</b> Non inverting input of the internal error amplifier to control the output voltage. Connect this pin directly to the output pin in order to obtain lower or equal output voltages with respect to the reference voltage. Connect a voltage divider for higher output voltages than the reference. (See also application information.)
4	ST (version GS)	<b>Tracking Regulator Status Output (version GS only).</b> Open collector output. Connect via a pull-up resistor to a positive voltage rail. A low signal indicates fault conditions at the regulator's output.
5	EN/ADJ	<b>Adjust / Enable.</b> Connect the reference to this pin. The active high signal of the reference turns on the device; a low signal disables the IC. The reference voltage can be connected directly or by a voltage divider for lower output voltages (see application information).
8	I	<b>Input.</b> IC supply. For compensating line influences, a capacitor close to the IC terminals is recommended.

Where applicable a thermal via array under the exposed pad contacted the first inner copper layer.

## 5 Electrical Characteristics

### 5.1 Tracking Regulator

The output voltage  $V_Q$  is controlled by comparing it to the voltage applied at pin ADJ/EN and driving a PNP pass transistor accordingly. The control loop stability depends on the output capacitor  $C_Q$ , the load current, the chip temperature and the poles/zeros introduced by the integrated circuit and the load. To ensure stable operation, the output capacitor's capacitance and its equivalent series resistor ESR requirements given in the table "Functional Range" have to be maintained. For details see also the typical performance graph "Output Capacitor Series Resistor  $ESR_{CQ}$  vs. Output Current  $I_Q$ ". Also, the output capacitor shall be sized to buffer load transients.

An input capacitor  $C_I$  is strongly recommended to buffer line influences. Connect the capacitors close to the IC terminals.

Protection circuitry prevent the IC as well as the application from destruction in case of catastrophic events. These safeguards contain output current limitation, reverse polarity protection as well as thermal shutdown in case of overtemperature.

In order to avoid excessive power dissipation that could never be handled by the pass element and the package, the maximum output current is decreased at high input voltages.

The overtemperature protection circuit prevents the IC from immediate destruction under fault conditions (e. g. output continuously short-circuited) by reducing the output current. A thermal balance below 200 °C junction temperature is established. Please note that a junction temperature above 150 °C is outside the maximum ratings and reduces the IC lifetime.

The TLE4254 allows a negative supply voltage. However, several small currents are flowing into the IC increasing its junction temperature. This has to be considered for the thermal design, respecting that the thermal protection circuit is not operating during reverse polarity condition.

### 5.3 Adjust / Enable Input

In order to reduce the quiescent current to a minimum, the TLE4254 can be switched to stand-by mode by setting the adjust/enable input "ADJ/EN" to "low".

In case the pin "ADJ/EN" is left open, an internal pull-down resistor keeps the voltage at the pin low and therefore ensures that the regulator is switched off.

**Table 3 Electrical Characteristics Adjust / Enable**

$V_I = 13.5 \text{ V}$ ;  $V_{\text{ADJ/EN}} \geq 2.0 \text{ V}$ ;  $V_{\text{FB}} = V_Q$  (version GA / EJ A);  $-40^\circ\text{C} \leq T_j \leq 150^\circ\text{C}$ ;  $C_Q = 1 \mu\text{F}$

## 5.4 Status Output (version GS / EJ S only)

The status output ST indicates an overvoltage or undervoltage situation at the regulator's output Q. Therefore, the output voltage  $V_Q$  is compared to the reference voltage  $V_{\text{ADJ/EN}}$ . Variations of the output voltage are indicated by a low signal at the status output ST. Transients shorter than the status reaction time  $t_{\text{ST,r}}$  will not trigger the status output.

The status output ST is an open collector output, requiring a pull-up resistor to a positive voltage rail.

**Table 4 Electrical Characteristics Status Output ST (Version GS / EJ S only)**

$V_I = 13.5 \text{ V}$ ;  $V_{\text{ADJ/EN}} \geq 2.0 \text{ V}$ ;  $-40 \text{ }^\circ\text{C} \leq T_j \leq 150 \text{ }^\circ\text{C}$ ;  $C_Q = 1 \mu\text{F}$

## 6 Application Information

*Note: The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device. The application circuits shown are simplified examples. The function must be verified in the real application.*

**Figure 5 Application circuit: Output voltage  $V_Q$  equal to reference voltage  $V_{ADJ/EN}$**

**Figure 5** shows a typical schematic for applications where the tracker output voltage  $V_Q$  equals the reference voltage  $V_{REF}$  applied to the pin "EN/ADJ". At version GA / EJ A, the pin FB is directly connected to the output "Q". The reference voltage is directly applied to "EN/ADJ".

**Figure 6 Application circuit: Output voltage  $V_Q$  lower than reference voltage  $V_{REF}$   
Status Output feedbacked to microcontroller (version GS / EJ S)**

In order to obtain a lower output voltage  $V_Q$  at the tracker output than the reference voltage  $V_{REF}$ , a voltage divider according to [Application circuit: Output voltage  \$V\_Q\$  lower than reference voltage  \$V\_{REF}\$  Status Output feedbacked to microcontroller \(version GS / EJ S\)](#) has to be used. The output voltage  $V_Q$  then calculates:

$$V_Q = V_{REF} \cdot \left( \frac{R2_{ADJ}}{R1_{ADJ} + R2_{ADJ}} \right)$$

With a given reference voltage  $V_{REF}$ , the desired output voltage  $V_Q$  and the resistor value  $R1_{ADJ}$ , the resistor value for  $R2_{ADJ}$  is given by:

$$R2_{ADJ} = R1_{ADJ} \cdot \left( \frac{V_Q}{V_{REF} - V_Q} \right)$$

Taking into consideration also the effect of the internal EN/ADJ pull-down resistor, the external resistor divider's  $R2_{ADJ}$  has to be selected to:

$$R2_{ADJ,select} = \left( \frac{R2_{ADJ} \cdot R_{PullDown,min}}{R_{PullDown,min} - R2_{ADJ}} \right)$$

**Figure 7 Application circuit: Output voltage  $V_Q$  higher than reference voltage  $V_{REF}$  (version GA / EJ A only)**

For output voltages higher than the reference voltage, the voltage divider has to be applied between the feedback and the output according to [Application circuit: Output voltage  \$V\_Q\$  higher than reference voltage  \$V\_{REF}\$  \(version GA / EJ A only\)](#). The equation for the output voltage with respect to the reference voltage is given by:

$$V_Q = V_{REF} \cdot \left( \frac{R1_{FB} + R2_{FB}}{R2_{FB}} \right)$$

Keep in mind that the input voltage has to be at minimum equal to the output voltage plus the dropout voltage of the regulator.

With a given reference voltage  $V_{REF}$ , the desired output voltage  $V_Q$  and the resistor value  $R1_{FB}$ , the resistor value for  $R2_{FB}$  is given by:

$$R2_{FB} = R1_{FB} \cdot \left( \frac{V_{REF}}{V_Q - V_{REF}} \right)$$

With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation, warranties of non-infringement of intellectual property rights of any third party.

#### **Information**

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office ([www.infineon.com](http://www.infineon.com)).

#### **Warnings**

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.

Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.
