

Features

- Digital Self-supervising Watchdog with Hysteresis
- One 150-mA Output Driver for Relay
- One High-side Driver for N-channel Power FET
- Positive and Negative Enable Output
- Positive and Negative Reset Output
- Over/Under-voltage Detection
- Relay and Power FET Outputs Protected Against Standard Transients and 55-V Load Dump

1. Description

The function of microcontrollers in safety-critical applications (e.g., anti-lock systems) needs to be monitored permanently. Usually, this task is accomplished by an independent watchdog timer. The monolithic IC U6813B, designed in bipolar technology and qualified according to the needs of the automotive industry, includes such a watchdog timer and provides additional features for added value. With the help of integrated driver stages, it is easy to control safety-related functions of a relay and of an N-channel power MOSFET in high-side applications. In case of a microcontroller malfunction or supply-voltage anomalies, the U6813B provides positive and negative reset and enable output signals. This flexibility guarantees a broad range of applications. The U6813B is based on of Atmel's fail-safe ICs U6808B and U6809B.

Fail-safe IC with High-side and Relay Driver

2. Pin Configuration

Figure 2-1. Pinning SO16

Table 2-1. Pin Description

Pin	Symbol	Description	Function	Type
1	RELO	Open-collector output driver	Fail-safe relay driver	Driver on: L
2	GND	Supply	General ground	
3	P-RES	Digital output	Positive reset signal	Reset: H
4	N-RES	Digital output	Negative reset signal	Reset: L
5	P-EN	Digital output	Positive enable signal	Enable: H
6	N-EN	Digital output	Negative enable signal	Enable: L
7	V _S	Battery supply	Voltage for charge pump	
8	CAPI	Analog input	Input bootstrap capacitor	
9	FETO	Power FET output	High voltage for N-channel FET	
10	WDC	Analog input	External RC for watchdog timer	
11	WDI	Digital input	Watchdog trigger signal	Pulse sequence
12	FETI	Digital input	Activation of power FET	FET on: H
13	RELI	Digital input	Activation of relay driver	Driver on: H
14	V _{CC}	Supply	5-V supply	
15	SGND	Supply	Sense ground, reference for V _{CC} and 3.3 V	
16	3.3V	Analog input	3.3-V supply	

3. Fail-safe Functions

A fail-safe IC has to maintain its monitoring function even if there is a fault condition at one of the pins (e.g., short circuit), ensuring that a microcontroller system does not reach a “critical status”. A critical status means, for example, if the system is not able to switch off the relay or disable the power MOSFET, or if the system is not able to provide a signal to the microcontroller via ENABLE- and RESET-outputs in the case of a fault condition. The U6813B is designed to handle those fault conditions according to [Table 3-1](#) for a maximum of system safety.

Table 3-1. Truth Table

VCC	3.3V	WDI	RELI	FETI	RELO	FETO	N-RES	P-RES	P-EN ⁽²⁾	N-EN ⁽³⁾
ok	ok	ok	H	x	on	x	H	L	H	L
ok	ok	ok	L ⁽¹⁾	x	off	x	H	L	H	L
ok	ok	ok	x	H	x	on	H	L	H	L
ok	ok	ok	x	L ⁽¹⁾	x	off	H	L	H	L
ok	ok	wrong	x	x	off	off	H	L	L	H
x	wrong	x	x	x	off	off	L	H	L	H
wrong	x	x	x	x	off	off	L	H	L	H

- Notes:
1. default state at open input
 2. P-EN disable: low
 3. N-EN disable: high

4. Watchdog Description

Figure 4-1. Watchdog Block Diagram

The microcontroller is monitored by a digital window watchdog which accepts an incoming trigger signal of a constant frequency for correct operation. The frequency of the trigger signal can be varied in a broad range as the watchdog's time window is determined by external R/C components. The following description refers to the watchdog timing diagram with tolerances (see [Figure 4-2 on page 5](#)).

4.1 WDI Input (Pin 11)

The microcontroller has to provide a trigger signal with the frequency f_{WDI} which is fed to the WDI input. A positive edge of f_{WDI} detected by a slope detector resets the binary counter and clocks the up/down counter. The latter one counts only from 0 to 3 or reverse. Each correct trigger increments the up/down counter by 1, each wrong trigger decrements it by 1. As soon as the counter reaches status 3, the RS flip-flop is set; see [Figure 4-3](#) (Watchdog state diagram). A missing incoming trigger signal is detected after 250 clocks of the internal watchdog frequency f_{RC} (see WD_OK output) and resets the up/down counter directly.

4.2 WDC Input (Pin 10)

It is to be equipped by external R/C components. By means of an external R/C circuitry, the IC generates a time base (frequency f_{WDC}) independent from the microcontroller. The watchdog's time window refers to a frequency of $f_{WDC} = 100 \times f_{WDI}$.

4.3 OSCERR Input

A smart watchdog has to ensure that internal problems with its own time base are detected and do not lead to an undesired status of the complete system. If the RC oscillator stops oscillating, a signal is fed to the OSCERR input after a time-out delay. It resets the up/down counter and disables the WD-OK output. Without this reset function, the watchdog would freeze its current status when f_{RC} stops.

4.4 RESET Input

During power-on and under/overvoltage detection, a reset signal is fed to this pin. It resets the watchdog timer and sets the initial state.

4.5 WD-OK Output

After the up/down counter has reached to status 3 (see [Figure 4-3](#), Watchdog State Diagram), the RS flip-flop is set and the WD-OK output becomes logic "1". As WD-OK is directly connected to the enable pins, the open-collector output P-EN provides also logic "1" while a logic "0" is available at N-EN output. If on the other hand the up/down counter is decremented to "0", the RS flip-flop is reset, the WD-OK output and the P-EN output are logic "0" and N-EN output is logic "1". The WD-OK output also controls a dual MUX stage which shifts the time window by one clock after a successful trigger, thus forming a hysteresis to provide stable conditions for the evaluation of the trigger signal "good or false". The WD-OK signal is also reset in case the watchdog counter is not reset after 250 clocks (missing trigger signal).

Figure 4-2. Watchdog Timing Diagram with Tolerances

Figure 4-3. Watchdog State Diagram

4.6 Explanation

In each block, the first character represents the state of the counter. The second notation indicates the fault status of the counter. A fault status is indicated by an “F” and a no-fault status is indicated by an “NF”. When the watchdog is powered up initially, the counter starts at the O/F block (initial state). “Good” indicates that a pulse has been received whose width resides within the timing window. “Bad” indicates that a pulse has been received whose width is either too short or too long.

4.7 Watchdog Window Calculation

Example with recommended values

$C_{osc} = 6.8 \text{ nF}$ (should be preferably 10%, NPO)

$R_{osc} = 36 \text{ k}\Omega$ (can be 5%, $R_{osc} < 200 \text{ k}\Omega$ due to leakage current and humidity)

RC oscillator

$$t_{WDC} \text{ (s)} = 10^{-3} [C_{osc} \text{ (nF)} [(0.00078 R_{osc} \text{ (k}\Omega) + 0.0005)]$$

$$f_{WDC} \text{ (Hz)} = 1/(t_{WDC})$$

Watchdog WDI

$$f_{WDI} \text{ (Hz)} = 0.01 f_{WDC}$$

$$t_{WDC} = 200 \mu\text{s} \rightarrow f_{WDC} = 5 \text{ kHz}$$

$$f_{WDI} = 50 \text{ Hz} \rightarrow t_{WDI} = 20 \text{ ms}$$

WDI pulse width for fault detection after 3 pulses:

Upper watchdog window

$$\text{Minimum: } 169 / f_{WDC} = 33.8 \text{ ms} \rightarrow f_{WDC} / 169 = 29.55 \text{ Hz}$$

$$\text{Maximum: } 170 / f_{WDC} = 34 \text{ ms} \rightarrow f_{WDC} / 170 = 29.4 \text{ Hz}$$

Lower watchdog window

$$\text{Minimum: } 79 / f_{WDC} = 15.8 \text{ ms} \rightarrow f_{WDC} / 79 = 63.3 \text{ Hz}$$

$$\text{Maximum: } 80 / f_{WDC} = 16 \text{ ms} \rightarrow f_{WDC} / 80 = 62.5 \text{ Hz}$$

WDI dropouts for immediate fault detection:

Minimum: $250/f_{WDC} = 50.0 \text{ ms}$

Maximum: $251/f_{WDC} = 50.2 \text{ ms}$

Remarks to reset relay

The duration of the over- or undervoltage pulses determines the enable- and reset outputs. A pulse duration shorter than the debounce time has no effect on the outputs. A pulse longer than the debounce time results in the first reset delay. If a pulse appears during this delay, a second delay time is triggered. Therefore, the total reset delay time can be longer than specified in the data sheet.

5. Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Parameters	Symbol	Value	Unit
Supply voltage range	V_S	−0.2 to +26	V
Power dissipation $V_S = 5\text{V}; T_{\text{amb}} = -40^\circ\text{C}$ $V_S = 5\text{V}; T_{\text{amb}} = 125^\circ\text{C}$	P_{tot} P_{tot}	250 150	mW mW
Junction temperature	T_j	150	$^\circ\text{C}$
Ambient temperature range	T_{amb}	−40 to +125	$^\circ\text{C}$
Storage temperature range	T_{stg}	−55 to +155	$^\circ\text{C}$

6. Thermal Resistance

Parameters	Symbol	Value	Unit
