[MEMO]

NOTES FOR CMOS DEVICES

① VOLTAGE APPLICATION WAVEFORM AT INPUT PIN

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (MAX) and V_{IH} (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (MAX) and V_{IH} (MIN).

② HANDLING OF UNUSED INPUT PINS

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

③ PRECAUTION AGAINST ESD

A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

④ STATUS BEFORE INITIALIZATION

Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.

⑤ POWER ON/OFF SEQUENCE

In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current.

The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

⑥ INPUT OF SIGNAL DURING POWER OFF STATE

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

• **The information in this document is current as of August, 2006. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC Electronics data sheets or data books, etc., for the most up-to-date specifications of NEC Electronics products. Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.**

- No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Electronics. NEC Electronics assumes no responsibility for any errors that may appear in this document.
- NEC Electronics does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC Electronics products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Electronics or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of a customer's equipment shall be done under the full responsibility of the customer. NEC Electronics assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC Electronics endeavors to enhance the quality, reliability and safety of NEC Electronics products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC Electronics products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment and anti-failure features.
- NEC Electronics products are classified into the following three quality grades: "Standard", "Special" and "Specific".

The "Specific" quality grade applies only to NEC Electronics products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of an NEC Electronics product depend on its quality grade, as indicated below. Customers must check the quality grade of each NEC Electronics product before using it in a particular application.

"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots.

"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support).

"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC Electronics products is "Standard" unless otherwise expressly specified in NEC Electronics data sheets or data books, etc. If customers wish to use NEC Electronics products in applications not intended by NEC Electronics, they must contact an NEC Electronics sales representative in advance to determine NEC Electronics' willingness to support a given application.

(Note)

- (1) "NEC Electronics" as used in this statement means NEC Electronics Corporation and also includes its majority-owned subsidiaries.
- (2) "NEC Electronics products" means any product developed or manufactured by or for NEC Electronics (as defined above).

INTRODUCTION

Target Readers	This application note is intended for users who understand the functions of the V850ES/Hx2 and who will use this product to design application systems.																
Purpose	<p>The purpose of this application note is to help users understand how to develop dedicated flash memory programmers for rewriting the internal flash memory of the V850ES/Hx2.</p> <p>The sample programs and circuit diagrams shown in this document are for reference only and are not intended for use in actual design-ins.</p> <p>Therefore, these sample programs must be used at the user's own risk. Correct operation is not guaranteed if these sample programs are used.</p>																
Organization	<p>This manual consists of the following main sections.</p> <ul style="list-style-type: none">• Flash memory programming• Programmer operating environment• Basic programmer operation• Command/data frame format• Description of command processing• UART communication mode• 3-wire serial I/O communication mode with handshake supported (CSI + HS)• 3-wire serial I/O communication mode (CSI)• Flash memory programming parameter characteristics																
How to Read This Manual	<p>It is assumed that the reader of this manual has general knowledge in the fields of electrical engineering, logic circuits, and microcontrollers.</p> <p><input type="checkbox"/> To learn more about the V850ES/Hx2's hardware functions: → See the user's manual of each V850ES/Hx2 product.</p>

CHAPTER 1 FLASH MEMORY PROGRAMMING

To rewrite the contents of the internal flash memory of the V850ES/Hx2, a dedicated flash memory programmer (hereafter referred to as the “programmer”) is usually used.

This Application Note explains how to develop a dedicated programmer.

1.1 Overview

The V850ES/Hx2 incorporates firmware that controls flash memory programming. The programming to the internal flash memory is performed by transmitting/receiving commands between the programmer and the V850ES/Hx2 via serial communication.

Figure 1-1. System Outline of Flash Memory Programming in V850ES/Hx2

1.2 System Configuration

Examples of the system configuration for programming the flash memory are illustrated in Figure 1-2.

These figures illustrate how to program the flash memory with the programmer, under control of a host machine.

Depending on how the programmer is connected, the programmer can be used in a standalone mode without using the host machine, if a user program has been downloaded to the programmer in advance.

For example, NEC Electronics' flash memory programmer PG-FP4 can execute programming either by using the GUI software with a host machine connected or by itself (standalone).

Figure 1-2. System Configuration Examples

(1) UART communication mode (LSB-first transfer)

(2) 3-wire serial I/O communication mode with handshake supported (CSI + HS) (MSB-first transfer)

(3) 3-wire serial I/O communication mode (CSI) (MSB-first transfer)

1.3 Programming Overview

To rewrite the contents of the flash memory with the programmer, the V850ES/Hx2 must first be set to the flash memory programming mode. After that, select the mode for communication between the programmer and the V850ES/Hx2, transmit commands from the programmer via serial communication, and then rewrite the flash memory. The flowchart of programming is illustrated in Figure 1-3.

Figure 1-3. Programming Flowchart

1.3.1 Setting flash memory programming mode

Supply a specific voltage to the flash memory programming mode setting pins (FLMD0 and FLMD1) in the V850ES/Hx2 and release a reset; the flash memory programming mode is then set.

1.3.2 Selecting serial communication mode

To select a serial communication mode, generate pulses by changing the voltage at flash memory programming mode setting pin (FLMD0) between the V_{DD} voltage and GND voltage in the flash memory programming mode, and determine the communication mode according to the pulse count.

1.3.3 Manipulating flash memory via command transmission/reception

The flash memory incorporated in the V850ES/Hx2 has functions to rewrite the flash memory contents. The flash memory manipulating functions shown in Table 1-1 are available.

Table 1-1. Outline of Flash Memory Functions

Function	Outline
Erase	Erases the flash memory contents.
Write	Writes data to the flash memory.
Verify	Compares the flash memory contents with data for verify.
Acquisition of information	Reads information related to the flash memory.

To control these functions, the programmer transmits commands to the V850ES/Hx2 via serial communication. The V850ES/Hx2 returns the response status for the commands. The programming to the flash memory is performed by repeating these series of serial communications.

1.4 Information Specific to V850ES/Hx2

The programmer must manage product-specific information (such as a device name and memory information).

Table 1-2 shows the flash memory size of the V850ES/Hx2 and Figure 1-4 shows the configuration of the flash memory.

Table 1-2. Flash Memory Size of V850ES/Hx2

Device Name		Flash Memory Size
V850ES/HE2	μ PD70F3700	64 KB
	μ PD70F3701	128 KB

Figure 1-4. Flash Memory Configuration

CHAPTER 2 PROGRAMMER OPERATING ENVIRONMENT

2.1 Programmer Control Pins

Table 2-1 lists the pins that the programmer must control to implement the programmer function in the user system. See the following pages for details on each pin.

Table 2-1. Pin Description

Programmer			V850ES/Hx2	Mode for Communication with Target System		
Signal Name	I/O	Pin Function	Pin Name	CSI	CSI + HS	UART
FLMD0	Output	Output of signal level to set programming mode and output of pulse to select communication mode	FLMD0	○	○	○
FLMD1	Output	Output of signal level to set programming mode	FLMD1	○	○	○
V _{DD}	Output	V _{DD} voltage generation/monitoring	V _{DD}	△	△	△
GND	–	Ground	V _{SS}	○	○	○
CLK	Output	Operating clock output to V850ES/Hx2	–	× ^{Note}	× ^{Note}	× ^{Note}
$\overline{\text{RESET}}$	Output	Programming mode switching trigger	$\overline{\text{RESET}}$	○	○	○
SO	Output	Command transmission to V850ES/Hx2	SIB0	○	○	×
SI	Input	Response status and data reception from V850ES/Hx2	SOB0	○	○	×
$\overline{\text{SCK}}$	Output	Serial clock supply to V850ES/Hx2	$\overline{\text{SCKB0}}$	○	○	×
HS (handshake)	Input	Handshake signal reception for serial communication with V850ES/Hx2	PCM0	×	○	×
TxD	Output	Command transmission to V850ES/Hx2	RXDA0	×	×	○
RxD	Input	Response status and data reception from V850ES/Hx2	TXDA0	×	×	○

Note No clock can be supplied from the CLK pin of the programmer. Mount an oscillator circuit onto the target system to supply the clock.

Remark ○: Be sure to connect the pin.

×: The pin is not connected.

△: The pin does not have to be connected if the signal is generated in the user system.

For the voltage of the pins controlled by the programmer, refer to the user's manual of the device that is subject to flash memory programming.

2.2 Details of Control Pins

2.2.1 Flash memory programming mode setting pins (FLMD0, FLMD1)

The FLMD0 and FLMD1 pins are used to control the operating mode of the V850ES/Hx2. The V850ES/Hx2 operates in flash memory programming mode when a specific voltage is supplied to these pins and a reset is released.

The mode for the serial communication between the programmer and the V850ES/Hx2 is determined by controlling the voltage at the FLMD0 pin between V_{DD} and GND and outputting pulses, after reset. Refer to **Table 2-3** in **2.5 Selecting Serial Communication Mode** for the relationship between the FLMD0 pulse counts and communication modes.

2.2.2 Serial interface pins (TxD, RxD, SI, SO, \overline{SCK} , HS)

The serial interface pins are used to transfer the flash memory writing commands between the programmer and the V850ES/Hx2.

With the V850ES/Hx2, the communication mode can be selected from UART, CSI + HS, and CSI. The following figures illustrate the connection of pins used in each communication mode.

Figure 2-1. Serial Interface Pins

(1) UART communication mode

(2) 3-wire serial I/O communication mode with handshake supported (CSI + HS)

(3) 3-wire serial I/O communication mode (CSI)

2.2.3 Reset control pin ($\overline{\text{RESET}}$)

The reset control pin is used to control the system reset for the V850ES/Hx2 from the programmer. The flash memory programming mode can be selected when a specific voltage is supplied to the FLMD0 and FLMD1 pins and a reset is released.

Figure 2-2. Reset Control Pin

2.2.4 Clock control pin (CLK)

The clock control pin is not used.

No clock can be supplied from the CLK pin of the programmer. Mount an oscillator circuit onto the target system to supply the clock.

2.2.5 V_{DD} /GND control pins

The V_{DD} control pin is used to supply power to the V850ES/Hx2 from the programmer. Connection of this pin is not necessary when it is not necessary to supply power to the V850ES/Hx2 from the programmer. However, this pin must be connected regardless of whether the power is supplied from the programmer when the dedicated programmer is used, because the dedicated programmer monitors the power supply status of the V850ES/Hx2.

The GND control pin must be connected to V_{SS} of the V850ES/Hx2 regardless of whether the power is supplied from the programmer.

Figure 2-3. V_{DD} /GND Control Pin

2.2.6 Other pins

For the connection of the pins that are not connected to the programmer, refer to the chapter describing the flash memory in the user's manual of each device.

2.3 Basic Flowchart

The following illustrates the basic flowchart for performing flash memory rewriting with the programmer.

Figure 2-4. Basic Flowchart for Flash Memory Rewrite Processing

2.4 Setting Flash Memory Programming Mode

To rewrite the contents of the flash memory with the programmer, the V850ES/Hx2 must first be set to the flash memory programming mode by supplying a specific voltage to the flash memory programming mode setting pins (FLMD0, FLMD1) in the V850ES/Hx2, then releasing a reset.

The following illustrates a timing chart for setting the flash memory programming mode and selecting the communication mode.

Figure 2-5. Setting Flash Memory Programming Mode and Selecting Communication Mode

The relationship between the settings of the FLMD0 and FLMD1 pins after reset release and the operating mode is shown below.

Table 2-2. Relationship Between Settings of FLMD0 and FLMD1 Pins After Reset Release and Operating Mode

FLMD0	FLMD1	Operating Mode
Low (GND)	Any	Normal operating mode
High (V_{DD})	Low (GND)	Flash memory programming mode
High (V_{DD})	High (V_{DD})	Setting prohibited

2.4.1 Mode setting flowchart

2.4.2 Sample program

The following shows a sample program for mode setting.

```

/*****
/*
/*      connect to Flash device
/*
/*
/*****

void    fl_con_dev(void)
{
extern  void    init_fl_uart(void);
extern  void    init_fl_csi(void);

    int    n;
    int    pulse;

    SRMK0 = true;        // disable UART Rx INT.
   UARTE0 = false;      // disable UART H.W.

    switch (fl_if){      // preset pulse count by I/F
        default:
            case  FLIF_UART:    pulse = PULSE_UART;        break;
            case  FLIF_CSI:     pulse = PULSE_CSI;         break;
            case  FLIF_CSI_HS:  pulse = PULSE_CSIHS;       break;

    }

    pFL_RES      = low;        // RESET = low
    pmFL_FLMD0   = PM_OUT;     // FLMD0 = Low output
    pFL_FLMD0    = low;
    pmFL_FLMD1   = PM_OUT;     // FLMD1 = Low output
    pFL_FLMD1    = low;
    FL_VDD_HI();              // VDD = high

    fl_wait(tDP);            // wait

    pFL_FLMD0    = hi;        // FLMD0 = high
    fl_wait(tPR);           // wait

    pFL_RES      = hi;        // RESET = high
    start_flto(tRC);        // start "tRC" wait timer
    fl_wait((tRP+tRPE)/2);  // wait

    if (fl_if == FLIF_UART){
        init_fl_uart();      // Initialize UART h.w.(for Flash device control)
        UARTE0 = true;       // enable UART h.w.
        SRIF0 = false;       // clear UART Rx IRQ flag
        SRMK0 = false;       // enable UART Rx INT.
    }
    else{
        init_fl_csi();       // Initialize CSI h.w.
    }
    for (n = 0; n < pulse; n++){// pulse output

        pFL_FLMD0 = low;

```

```
        fl_wait(tpW);
        pFL_FLMD0 = hi;
        fl_wait(tpW);
    }

    while(!check_flto())    // timeout tRC ?
        ;                  // no

    // start RESET command proc.
}
```

2.5 Selecting Serial Communication Mode

The communication mode is determined by inputting a pulse to the FLMD0 pin in the V850ES/Hx2 after reset release.

The high- and low-levels of the FLMD0 pulse are V_{DD} and GND, respectively.

The following table shows the relationship between the number of FLMD0 pulses (pulse counts) and communication modes that can be selected with the V850ES/Hx2.

Table 2-3. Relationship Between FLMD0 Pulse Counts and Communication Modes

Communication Mode	FLMD0 Pulse Counts	Port Used for Communication
UART (UART0)	0	TXDA0 (P30), RXDA0 (P31)
3-wire serial I/O (CSIB0)	8	SOB0 (P41), SIB0 (P40), $\overline{SCKB0}$ (P42)
3-wire serial I/O with handshake supported (CSIB0 + HS)	11	SOB0 (P41), SIB0 (P40), $\overline{SCKB0}$ (P42), HS (PCM0)
Setting prohibited	Others	–

2.6 UART Communication Mode

The RxD and TxD pins are used for UART communication. The communication conditions are as shown below.

Table 2-4. UART Communication Conditions

Item	Description
Baud rate	Selectable from 9,600, 19,200, 31,250, 38,400, 76,800, and 153,600 bps (default: 9,600 bps)
Parity bit	None
Data length	8 bits (LSB first)
Stop bit	1 bit

The programmer always operates as the master device during CSI communication, so the programmer must check whether the processing by the V850ES/Hx2, such as writing or erasing, is normally completed. On the other hand, the status of the master and slave is occasionally exchanged during UART communication, so communication at the optimum timing is possible without assigning one pin like CSI + HS communication.

Caution Set the same baud rate to the master and slave devices when performing UART communication.

2.7 3-Wire Serial I/O Communication Mode with Handshake Supported (CSI + HS)

In the CSI + HS communication mode, the timing for communication of commands or data is optimized. In addition to the SI, SO and $\overline{\text{SCK}}$ pins, the HS (handshake) pin is used for implementing effective communication.

The level of the HS pin signal falls (low level) when the V850ES/Hx2 is ready for transmitting or receiving data. The programmer must check the falling edge of the HS pin signal (low level) before starting transmission/reception of commands or data to the V850ES/Hx2.

The communication data format is MSB-first, in 8-bit units. Keep the clock frequency 2.5 MHz or lower.

Figure 2-6. Timing Chart of CSI + HS Communication

2.8 3-Wire Serial I/O Communication Mode (CSI)

The $\overline{\text{SCK}}$, SO and SI pins are used for CSI communication. The programmer always operates as the master device, so communication may not be performed normally if data is transmitted via the SCK pin while the V850ES/Hx2 is not ready for transmission/reception.

The communication data format is MSB-first, in 8-bit units. Keep the clock frequency 2.5 MHz or lower.

2.9 Shutting Down Target Power Supply

After each command execution is completed, shut down the power supply to the target after setting the $\overline{\text{RESET}}$ pin to low level, as shown below.

Set other pins to Hi-Z when shutting down the power supply to the target.

Caution Shutting down the power supply and inputting a reset during command processing are prohibited.

Figure 2-7. Timing for Terminating Flash Memory Programming Mode

2.10 Manipulation of Flash Memory

The flash memory incorporated in the V850ES/Hx2 has functions to manipulate the flash memory, as listed in Table 2-5. The programmer transmits commands to control these functions to the V850ES/Hx2, and checks the response status sent from the V850ES/Hx2, to manipulate the flash memory.

Table 2-5. List of Flash Memory Manipulating Functions

Classification	Function Name	Description
Erase	Chip erase	Erases the entire flash memory area. Clears the security flag.
	Block erase	Erases a specified block in the flash memory.
Write	Write	Writes data to a specified area in the flash memory.
Verify	Verify	Compares data acquired from a specified address in the flash memory with data transmitted from the programmer, on the V850ES/Hx2 side.
Blank check	Block blank check	Checks the erase status of a specified area in the flash memory.
Information acquisition	Silicon signature acquisition	Acquires writing protocol information.
	Version acquisition	Acquires version information of the V850ES/Hx2 and firmware.
	Status acquisition	Acquires the current operating status.
	Checksum acquisition	Acquires checksum data of a specified area.
Security	Security setting	Sets security information.
Other	Reset	Detects synchronization in communication.

2.11 Command List

The commands used by the programmer and their functions are listed below.

Table 2-6. List of Commands Transmitted from Programmer to V850ES/Hx2

Command Number	Command Name	Function
70H	Status	Acquires the current operating status (status data).
00H	Reset	Detects synchronization in communication.
90H	Oscillating Frequency Set	Specifies the oscillation frequency of the V850ES/Hx2.
9AH	Baud Rate Set	Sets baud rate when UART communication mode is selected.
20H	Chip Erase	Erases the entire flash memory area.
22H	Block Erase	Erases a specified area in the flash memory.
40H	Programming	Writes data to a specified area in the flash memory.
13H	Verify	Compares the contents in a specified area in the flash memory with data transmitted from the programmer.
32H	Block Blank Check	Checks the erase status of a specified block in the flash memory.
C0H	Silicon Signature	Acquires V850ES/Hx2 information (part number, flash memory configuration, etc.).
C5H	Version Get	Acquires version information of the V850ES/Hx2 and firmware.
B0H	Checksum	Acquires checksum data of a specified area.
A0H	Security Set	Sets security information.
50H	Read	Reads data of a specified area in the flash memory.

2.12 Status List

The following table lists the status codes the programmer receives from the V850ES/Hx2.

Table 2-7. Status Code List

Status Code	Status	Description
04H	Command number error	Error returned if a command not supported or invalid frame is received
05H	Parameter error	Error returned if command information (parameter) is invalid
06H	Normal acknowledgment (ACK)	Normal acknowledgment
07H	Checksum error	Error returned if data in a frame transmitted from the programmer is abnormal
08H	WWV1 error	Write error
0BH	EWV1 error	Erase error
0CH	EWV2 error	Erase error
0DH	EWV3 error	Erase error
0EH	Verify error	A verify error has occurred for the data of the frame transmitted from the programmer
0FH	Verify error	A verify error has occurred for the data of the frame transmitted from the programmer
10H	Protect error	Error returned if an attempt is made to execute processing that is prohibited by the Security Set command
11H	EWV4 error	Internal verify error/blank error
13H	Compaction search error	Erase error
15H	Negative acknowledgment (NACK)	Negative acknowledgment
16H	Sequencer error	Error returned if an error occurs in flash control macro
FFH	Processing in progress (BUSY)	Busy response ^{Note}

Note During CSI communication, 1-byte “FFH” may be transmitted, as well as “FFH” as the data frame format.

Reception of a checksum error or NACK is treated as an immediate abnormal end in this manual. When a dedicated programmer is developed, however, the processing may be retried without problem from the wait immediately before transmission of the command that results a checksum error or NACK or after BUSY status check via the HS pin. In this event, limiting the retry count is recommended for preventing infinite repetition of the retry operation.

Although not listed in the above table, if a time-out error (BUSY time-out, HS pin time-out, or time-out in data frame reception during UART communication) occurs, it is recommended to shutdown the power supply to the V850ES/Hx2 (refer to **2.9 Shutting Down Target Power Supply**) and then connect the power supply again.

CHAPTER 3 BASIC PROGRAMMER OPERATION

Figure 3-1 illustrates the general command execution flow when flash memory rewriting is performed with the programmer.

Figure 3-1. General Command Execution Flow at Flash Memory Rewriting

Note It is recommended to perform security settings to disable read as a default in programmer specification.

Remark The Verify command and Checksum command can also be supported.

CHAPTER 4 COMMAND/DATA FRAME FORMAT

The programmer uses the command frame to transmit commands to the V850ES/Hx2. The V850ES/Hx2 uses the data frame to transmit write data or verify data to the programmer. A header, footer, data length information, and checksum are appended to each frame to enhance the reliability of the transferred data.

The following shows the format of a command frame and data frame.

Figure 4-1. Command Frame Format

SOH (1 byte)	LEN (1 byte)	COM (1 byte)	Command information (variable length) (Max. 255 bytes)	SUM (1 byte)	ETX (1 byte)
-----------------	-----------------	-----------------	---	-----------------	-----------------

Figure 4-2. Data Frame Format

STX (1 byte)	LEN (1 byte)	Data (variable length) (Max. 256 bytes)	SUM (1 byte)	ETX or ETB (1 byte)
-----------------	-----------------	--	-----------------	------------------------

Table 4-1. Description of Symbols in Each Frame

Symbol	Value	Description
SOH	01H	Command frame header
STX	02H	Data frame header
LEN	–	Data length information (00H indicates 256). Command frame: COM + command information length Data frame: Data field length
COM	–	Command number
SUM	–	Checksum data for a frame Obtained by sequentially subtracting all of calculation target data from the initial value (00H) in 1-byte units (borrow is ignored). The calculation targets are as follows. Command frame: LEN + COM + all of command information Data frame: LEN + all of data
ETB	17H	Footer of data frame other than the last frame
ETX	03H	Command frame footer, or footer of last data frame

The following shows examples of calculating the checksum (SUM) for a frame.

[Command frame]

No command information is included in the following example of a Status command frame, so LEN and COM are targets of checksum calculation.

SOH	LEN	COM	SUM	ETX
01H	01H	70H	Checksum	03H
Checksum calculation targets				

For this command frame, checksum data is obtained as follows.

$$00H \text{ (initial value)} - 01H \text{ (LEN)} - 70H \text{ (COM)} = 8FH \text{ (Borrow ignored. Lower 8 bits only.)}$$

The command frame finally transmitted is as follows.

SOH	LEN	COM	SUM	ETX
01H	01H	70H	8FH	03H

[Data frame]

To transmit a data frame as shown below, LEN and D1 to D4 are targets of checksum calculation.

STX	LEN	D1	D2	D3	D4	SUM	ETX
02H	04H	FFH	80H	40H	22H	Checksum	03H
checksum calculation targets							

For this data frame, checksum data is obtained as follows.

$$00H \text{ (initial value)} - 04H \text{ (LEN)} - FFH \text{ (D1)} - 80H \text{ (D2)} - 40H \text{ (D3)} - 22H \text{ (D4)}$$

$$= 1BH \text{ (Borrow ignored. Lower 8 bits only.)}$$

The data frame finally transmitted is as follows.

STX	LEN	D1	D2	D3	D4	SUM	ETX
02H	04H	FFH	80H	40H	22H	1BH	03H

When a data frame is received, the checksum data is calculated in the same manner, and the obtained value is used to detect a checksum error by judging whether the value is the same as that stored in the SUM field of the receive data. When a data frame as shown below is received, for example, a checksum error is detected.

STX	LEN	D1	D2	D3	D4	SUM	ETX
02H	04H	FFH	80H	40H	22H	1AH	03H

↑ Should be 1BH, if normal

4.1 Command Frame Transmission Processing

Read the following chapters for details on flowcharts of command processing to transmit command frames, for each communication mode.

- For the UART communication mode, read **6.1 Flowchart of Command Frame Transmission Processing**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.1 Flowchart of Command Frame Transmission Processing**.
- For the 3-wire serial I/O communication mode (CSI), read **8.1 Flowchart of Command Frame Transmission Processing**.

4.2 Data Frame Transmission Processing

The write data frame (user program), verify data frame (user program), and security data frame (security flag) are transmitted as a data frame.

Read the following chapters for details on flowcharts of command processing to transmit data frames, for each communication mode.

- For the UART communication mode, read **6.2 Flowchart of Data Frame Transmission Processing**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.2 Flowchart of Data Frame Transmission Processing**.
- For the 3-wire serial I/O communication mode (CSI), read **8.2 Flowchart of Data Frame Transmission Processing**.

4.3 Data Frame Reception Processing

The status frame, silicon signature data frame, version data frame, and checksum data frame are received as a data frame.

Read the following chapters for details on flowcharts of command processing to receive data frames, for each communication mode.

- For the UART communication mode, read **6.3 Flowchart of Data Frame Reception Processing**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.3 Flowchart of Data Frame Reception Processing**.
- For the 3-wire serial I/O communication mode (CSI), read **8.3 Flowchart of Data Frame Reception Processing**.

CHAPTER 5 DESCRIPTION OF COMMAND PROCESSING

5.1 Status Command

5.1.1 Description

This command is used to check the operation status of the V850ES/Hx2 after issuance of each command such as write or erase.

After the Status command is issued, if the Status command frame cannot be received normally in the V850ES/Hx2 due to problems based on communication or the like, the status setting will not be performed in the V850ES/Hx2. As a result, a busy response (FFH), not the status frame, may be received. In such a case, retry the Status command.

5.1.2 Command frame and status frame

Figure 5-1 shows the format of a command frame for the Status command, and Figure 5-2 shows the status frame for the command.

Figure 5-1. Status Command Frame (from Programmer to V850ES/Hx2)

SOH	LEN	COM	SUM	ETX
01H	01H	70H (Status)	Checksum	03H

Figure 5-2. Status Frame for Status Command (from V850ES/Hx2 to Programmer)

STX	LEN	Data			SUM	ETX
02H	n	ST1	...	STn	Checksum	03H

- Remarks**
1. ST1 to STn: Status #1 to Status #n
 2. The length of a status frame varies according to each command (such as write or erase) to be transmitted to the V850ES/Hx2.

Read the following chapters for details on flowcharts of processing sequences between the programmer and the V850ES/Hx2, flowcharts of command processing, and sample programs for each communication mode.

- The Status command is not used in the UART communication mode.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.4 Status Command**.
- For the 3-wire serial I/O communication mode (CSI), read **8.4 Status Command**.

Caution After each command such as write or erase is transmitted in UART communication, the V850ES/Hx2 automatically returns the status frame within a specified time. The Status command is therefore not used.

If the Status command is transmitted in UART communication, the Command Number Error is returned.

5.2 Reset Command

5.2.1 Description

This command is used to check the establishment of communication between the programmer and the V850ES/Hx2 after the communication mode is set.

When UART is selected as the mode for communication with the V850ES/Hx2, the same baud rate must be set in the programmer and V850ES/Hx2. However, the V850ES/Hx2 cannot detect its own operating frequency so the baud rate cannot be set. It makes detection of the operating frequency in the V850ES/Hx2 possible by sending "00H" twice at 9,600 bps from the programmer, measuring the low-level width of "00H", and then calculating the average of two sent signals. The baud rate can consequently be set, which enables synchronous detection in communication.

5.2.2 Command frame and status frame

Figure 5-3 shows the format of a command frame for the Reset command, and Figure 5-4 shows the status frame for the command.

Figure 5-3. Reset Command Frame (from Programmer to V850ES/Hx2)

SOH	LEN	COM	SUM	ETX
01H	01H	00H (Reset)	Checksum	03H

Figure 5-4. Status Frame for Reset Command (from V850ES/Hx2 to Programmer)

STX	LEN	Data	SUM	ETX
02H	1	ST1	Checksum	03H

Remark ST1: Synchronization detection result

Read the following chapters for details on flowcharts of processing sequences between the programmer and the V850ES/Hx2, flowcharts of command processing, and sample programs for each communication mode.

- For the UART communication mode, read **6.4 Reset Command**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.5 Reset Command**.
- For the 3-wire serial I/O communication mode (CSI), read **8.5 Reset Command**.

5.3 Baud Rate Set Command

5.3.1 Description

This command is used to change the baud rate for UART (default value: 9,600 bps).

After the Baud Rate Set command is executed, the Reset command must be executed to confirm synchronization at the new baud rate.

The Baud Rate Set command is valid only in the UART communication mode. Data for setting the baud rate is represented as a 1-byte numeric value.

The V850ES/Hx2 ignores the Baud Rate Set command if it is transmitted in modes other than the UART communication mode.

5.3.2 Command frame and status frame

Figure 5-5 shows the format of a command frame for the Baud Rate Set command, and Figure 5-6 shows the status frame for the command.

Figure 5-5. Baud Rate Set Command Frame (from Programmer to V850ES/Hx2)

SOH	LEN	COM	Command Information	SUM	ETX
01H	02H	9AH (Baud Rate Set)	D01	Checksum	03H

Remark D01: Baud rate selection value

D01 Value	03H	04H	05H	06H	07H	08H
Baud rate (bps)	9600	19200	31250	38400	76800	153600

Figure 5-6. Status Frame for Baud Rate Set Command (from V850ES/Hx2 to Programmer)

STX	LEN	Data	SUM	ETX
02H	01H	ST1	Checksum	03H

Remark ST1: Synchronization detection result

Read the following chapters for details on flowcharts of processing sequences between the programmer and the V850ES/Hx2, flowcharts of command processing, and sample programs for each communication mode.

- For the UART communication mode, read **6.5 Baud Rate Set Command**.
- The Baud Rate Set command is not used in the 3-wire serial I/O communication mode with handshake supported (CSI + HS).
- The Baud Rate Set command is not used in 3-wire serial I/O communication mode (CSI).

5.4 Oscillating Frequency Set Command

5.4.1 Description

This command is used to set oscillation frequency data in the V850ES/Hx2.

Specify the frequency of the clock that is actually input to the X1 pin of the V850ES/Hx2.

The V850ES/Hx2 automatically sets the multiply rate of the CPU operation clock, based on the clock frequency specified with this command. Therefore, note that the reference clock for wait calculation varies before and after execution of this command.

5.4.2 Command frame and status frame

Figure 5-7 shows the format of a command frame for the Oscillating Frequency Set command, and Figure 5-8 shows the status frame for the command.

Figure 5-7. Oscillating Frequency Set Command Frame (from Programmer to V850ES/Hx2)

SOH	LEN	COM	Command Information				SUM	ETX
01H	05H	90H (Oscillating Frequency Set)	D01	D02	D03	D04	Checksum	03H

Remark D01 to D04: Oscillation frequency = $(D01 \times 0.1 + D02 \times 0.01 + D03 \times 0.001) \times 10^{D04}$ (Unit: kHz)
Settings can be made from 10 kHz to 100 MHz, but set the value according to the specifications of each device when actually transmitting the command. D01 to D03 hold unpacked BCDs, and D04 holds a signed integer.

Setting example: To set 6 MHz

D01 = 06H

D02 = 00H

D03 = 00H

D04 = 04H

Oscillation frequency = $6 \times 0.1 \times 10^4 = 6,000 \text{ kHz} = 6 \text{ MHz}$

Setting example: To set 10 MHz

D01 = 01H

D02 = 00H

D03 = 00H

D04 = 05H

Oscillation frequency = $1 \times 0.1 \times 10^5 = 10,000 \text{ kHz} = 10 \text{ MHz}$

Figure 5-8. Status Frame for Oscillating Frequency Set Command (from V850ES/Hx2 to Programmer)

STX	LEN	Data	SUM	ETX
02H	01H	ST1	Checksum	03H

Remark ST1: Oscillation frequency setting result

Read the following chapters for details on flowcharts of processing sequences between the programmer and the V850ES/Hx2, flowcharts of command processing, and sample programs for each communication mode.

- For the UART communication mode, read **6.6 Oscillating Frequency Set Command**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.6 Oscillating Frequency Set Command**.
- For the 3-wire serial I/O communication mode (CSI), read **8.6 Oscillating Frequency Set Command**.

5.5 Chip Erase Command

5.5.1 Description

This command is used to erase the entire contents of the flash memory. In addition, all of the information that is set by security setting processing can be initialized by chip erase processing, as long as erasure is not prohibited by the security setting (see **5.13 Security Set Command**).

5.5.2 Command frame and status frame

Figure 5-9 shows the format of a command frame for the Chip Erase command, and Figure 5-10 shows the status frame for the command.

Figure 5-9. Chip Erase Command Frame (from Programmer to V850ES/Hx2)

SOH	LEN	COM	SUM	ETX
01H	01H	20H (Chip Erase)	Checksum	03H

Figure 5-10. Status Frame for Chip Erase Command (from V850ES/Hx2 to Programmer)

STX	LEN	Data	SUM	ETX
02H	01H	ST1	Checksum	03H

Remark ST1: Chip erase result

Read the following chapters for details on flowcharts of processing sequences between the programmer and the V850ES/Hx2, flowcharts of command processing, and sample programs for each communication mode.

- For the UART communication mode, read **6.7 Chip Erase Command**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.7 Chip Erase Command**.
- For the 3-wire serial I/O communication mode (CSI), read **8.7 Chip Erase Command**.

5.6 Block Erase Command

5.6.1 Description

This command is used to erase the contents of blocks with the specified number in the flash memory, as long as erasure is not prohibited by the security setting (see **5.13 Security Set Command**).

5.6.2 Command frame and status frame

Figure 5-11 shows the format of a command frame for the Block Erase command, and Figure 5-12 shows the status frame for the command.

Figure 5-11. Block Erase Command Frame (from Programmer to V850ES/Hx2)

SOH	LEN	COM	Command Information	SUM	ETX

STX	LEN	Data	SUM	ETX
02H	01H	ST1	Checksum	03H

Remark ST1: Block erase result

Read the following chapters for details on flowcharts of processing sequences between the programmer and the V850ES/Hx2, flowcharts of command processing, and sample programs for each communication mode.

- For the UART communication mode, read **6.8 Block Erase Command**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.8 Block Erase Command**.
- For the 3-wire serial I/O communication mode (CSI), read **8.8 Block Erase Command**.

5.7 Programming Command

5.7.1 Description

This command is used to transmit data by the number of written bytes after the write start address and the write end address are transmitted. This command then writes the user program to the flash memory and verifies it internally.

The write start/end address can be set only in the block start/end address units.

If both of the status frames (ST1 and ST2) after the last data transmission indicate ACK, the V850ES/Hx2 firmware automatically executes internal verify. Therefore, the Status command for this internal verify must be transmitted.

5.7.2 Command frame and status frame

Figure 5-13 shows the format of a command frame for the Programming command, and Figure 5-14 shows the status frame for the command.

Figure 5-13. Programming Command Frame (from Programmer to V850ES/Hx2)

SOH	LEN	COM	Command Information						SUM	ETX

STX	LEN	Data	SUM	ETX
02H	01H	ST1 (c)	Checksum	03H

Remark ST1 (c): Internal verify result

Read the following chapters for details on flowcharts of processing sequences between the programmer and the V850ES/Hx2, flowcharts of command processing, and sample programs for each communication mode.

- For the UART communication mode, read **6.9 Programming Command**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.9 Programming Command**.
- For the 3-wire serial I/O communication mode (CSI), read **8.9 Programming Command**.

5.8 Verify Command

5.8.1 Description

This command is used to compare the data transmitted from the programmer with the data read from the V850ES/Hx2 (read level) in the specified address range, and check whether they match.

The verify start/end address can be set only in the block start/end address units.

5.8.2 Command frame and status frame

Figure 5-18 shows the format of a command frame for the Verify command, and Figure 5-19 shows the status frame for the command.

Figure 5-18. Verify Command Frame (from Programmer to V850ES/Hx2)

SOH	LEN	COM	Command Information						SUM	ETX
01H	07H	13H (Verify)	SAH	SAM	SAL	EAH	EAM	EAL	Checksum	03H

Remark SAH, SAM, SAL: Verify start addresses

EAH, EAM, EAL: Verify end addresses

Figure 5-19. Status Frame for Verify Command (from V850ES/Hx2 to Programmer)

02H	01H	ST1 (a)	Checksum	03H

Remark ST1 (a): Command reception result

5.8.3 Data frame and status frame

Figure 5-20 shows the format of a frame that includes data to be verified, and Figure 5-21 shows the status frame for the data.

Figure 5-20. Data Frame of Data to Be Verified (from Programmer to V850ES/Hx2)

STX	LEN	Data	SUM	ETX/ETB
02H	00H to FFH (00H = 256)	Verify data	Checksum	03H/17H

Remark Verify Data: User program to be verified

Figure 5-21. Status Frame for Data Frame (from V850ES/Hx2 to Programmer)

STX	LEN	Data		SUM	ETX
02H	02H	ST1 (b)	ST2 (b)	Checksum	03H

Remark ST1 (b): Data reception check result

ST2 (b): Verify result^{Note}

Note Even if a verify error occurs in the specified address range, ACK is always returned as the verify result. The status of all verify errors are reflected in the verify result for the last data. Therefore, the occurrence of verify errors can be checked only when all the verify processing for the specified address range is completed.

Read the following chapters for details on flowcharts of processing sequences between the programmer and the V850ES/Hx2, flowcharts of command processing, and sample programs for each communication mode.

- For the UART communication mode, read **6.10 Verify Command**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.10 Verify Command**.
- For the 3-wire serial I/O communication mode (CSI), read **8.10 Verify Command**.

5.9 Block Blank Check Command

5.9.1 Description

This command is used to check if a block in the flash memory, with a specified block number, is blank (erased state).

5.9.2 Command frame and status frame

Figure 5-22 shows the format of a command frame for the Block Blank Check command, and Figure 5-23 shows the status frame for the command.

Figure 5-22. Block Blank Check Command Frame (from Programmer to V850ES/Hx2)

SOH	LEN	COM	Command Information	SUM	ETX

STX	LEN	Data	SUM	ETX
02H	01H	ST1	Checksum	03H

Remark ST1: Block blank check result

Read the following chapters for details on flowcharts of processing sequences between the programmer and the V850ES/Hx2, flowcharts of command processing, and sample programs for each communication mode.

- For the UART communication mode, read **6.11 Block Blank Check Command**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.11 Block Blank Check Command**.
- For the 3-wire serial I/O communication mode (CSI), read **8.11 Block Blank Check Command**.

5.10 Silicon Signature Command

5.10.1 Description

This command is used to read the write protocol information (silicon signature) of the device.

If the programmer supports a programming protocol that is not supported in the V850ES/Hx2, for example, execute this command to select an appropriate protocol in accordance with the values of the second and third bytes.

5.10.2 Command frame and status frame

Figure 5-24 shows the format of a command frame for the Silicon Signature command, and Figure 5-25 shows the status frame for the command.

Figure 5-24. Silicon Signature Command Frame (from Programmer to V850ES/Hx2)

SOH	LEN	COM	SUM	ETX
01H	01H	C0H (Silicon Signature)	Checksum	03H

Figure 5-25. Status Frame for Silicon Signature Command (from V850ES/Hx2 to Programmer)

02H	01H	ST1	Checksum	03H

Remark ST1: Command reception result

5.10.3 Silicon signature data frame

Figure 5-26 shows the format of a frame that includes silicon signature data.

Figure 5-26. Silicon Signature Data Frame (from V850ES/Hx2 to Programmer)

STX	LEN	Data				SUM	ETX
02H	n	VEN	EXT	FNC	Invalid data	Checksum	03H

- Remarks**
1. n (LEN): Data length
 VEN: Vendor code (NEC: 10H)
 EXT: Extension code
 FNC: Function information
 INVALID DATA: Invalid data of 90 to 198-byte length.
 2. For the vendor code (VEN), extension code (EXT) and function information (FNC), the highest bit is used as an odd parity. The following shows an example.

Table 5-1. Example of Silicon Signature Data

Field	Contents	Length (Byte)	Example of Silicon Signature Data ^{Note}	Actual Value
VEN	Vendor code (NEC)	1	10H (00010000B)	10H
EXT	Extension code (fixed)	1	4FH (01001111B)	4FH
FNC	Function information (fixed)	1	40H (01000000B)	40H

Note The shaded bit is an odd parity (the value to adjust the number of “1” in a byte).

Read the following chapters for details on flowcharts of processing sequences between the programmer and the V850ES/Hx2, flowcharts of command processing, and sample programs for each communication mode.

- For the UART communication mode, read **6.12 Silicon Signature Command**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.12 Silicon Signature Command**.
- For the 3-wire serial I/O communication mode (CSI), read **8.12 Silicon Signature Command**.

5.11 Version Get Command

5.11.1 Description

This command is used to acquire information on the V850ES/Hx2 device version and firmware version.

Use this command when the programming parameters must be changed in accordance with the V850ES/Hx2 firmware version.

Caution The firmware version may be updated during firmware update that does not affect the change of flash programming parameters (at this time, update of the firmware version is not reported).

Example Firmware version and reprogramming parameters

5.11.2 Command frame and status frame

Figure 5-28 shows the format of a command frame for the Version Get command, and Figure 5-29 shows the status frame for the command.

Figure 5-28. Version Get Command Frame (from Programmer to V850ES/Hx2)

Remark DV1: Integer of device version
 DV2: First decimal place of device version
 DV3: Second decimal place of device version
 FV1: Integer of firmware version
 FV2: First decimal place of firmware version
 FV3: Second decimal place of firmware version

Read the following chapters for details on flowcharts of processing sequences between the programmer and the V850ES/Hx2, flowcharts of command processing, and sample programs for each communication mode.

- For the UART communication mode, read **6.13 Version Get Command**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.13 Version Get Command**.
- For the 3-wire serial I/O communication mode (CSI), read **8.13 Version Get Command**.

5.12 Checksum Command

5.12.1 Description

This command is used to acquire the checksum data in the specified area.

For the checksum calculation start/end address, specify a fixed address in block units (2 KB) starting from the top of the flash memory.

Checksum data is obtained by sequentially subtracting data in the specified address range from the initial value (00H) in 1-byte units.

5.12.2 Command frame and status frame

Figure 5-31 shows the format of a command frame for the Checksum command, and Figure 5-32 shows the status frame for the command.

Figure 5-31. Checksum Command Frame (from Programmer to V850ES/Hx2)

SOH	LEN	COM	Command Information						SUM	ETX

Figure 5-33. Checksum Data Frame (from V850ES/Hx2 to Programmer)

STX	LEN	Data		SUM	ETX
02H	02H	CK1	CK2	Checksum	03H

Remark CK1: Higher 8 bits of checksum data
CK2: Lower 8 bits of checksum data

Read the following chapters for details on flowcharts of processing sequences between the programmer and the V850ES/Hx2, flowcharts of command processing, and sample programs for each communication mode.

- For the UART communication mode, read **6.14 Checksum Command**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.14 Checksum Command**.
- For the 3-wire serial I/O communication mode (CSI), read **8.14 Checksum Command**.

5.13 Security Set Command

5.13.1 Description

This command is used to perform security settings (enable or disable of write, block erase, and chip erase). By performing these settings with this command, rewriting of the flash memory by an unauthorized party can be restricted.

Caution Once the security setting is performed, additional setting to the security flags or changing of the setting from disable to enable will no longer be possible. If such settings are attempted, a Write error (1CH) will occur. To re-set the security flag, all the security flags must be initialized by executing the Chip Erase command (the Block Erase command cannot be used to initialize the security flags). If chip erase has been disabled, however, chip erase itself will be impossible and so the settings cannot be erased from the programmer. Re-confirmation of security setting execution is therefore recommended before disabling chip erase, due to this programmer specification.

5.13.2 Command frame and status frame

Figure 5-34 shows the format of a command frame for the Security Set command, and Figure 5-35 shows the status frame for the command.

The Security Set command frame includes the block number field and page number field but these fields do not have any particular usage, so set these fields to 00H.

Figure 5-34. Security Set Command Frame (from Programmer to V850ES/Hx2)

SOH	LEN	COM	Command Information		SUM	ETX

Remark ST1 (b): ACK (06H) or NACK (15H) sent from the programmer for read data

Read the following chapters for details on flowcharts of processing sequences between the programmer and the V850ES/Hx2, flowcharts of command processing, and sample programs for each communication mode.

- For the UART communication mode, read **6.16 Read Command**.
- For the 3-wire serial I/O communication mode with handshake supported (CSI + HS), read **7.16 Read Command**.
- For the 3-wire serial I/O communication mode (CSI), read **8.16 Read Command**.

CHAPTER 6 UART COMMUNICATION MODE

6.1 Command Frame Transmission Processing Flowchart

6.2 Data Frame Transmission Processing Flowchart

6.4 Reset Command

6.4.1 Processing sequence chart

Reset command processing sequence

Note Do not exceed the retry count for the reset command transmission (up to 16 times).

6.4.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command processing starts (wait time t_{COM}).
- <2> The low level is output (data 00H is transmitted at 9,600 bps).
- <3> Wait state (wait time t_{12}).
- <4> The low level is output (data 00H is transmitted at 9,600 bps).
- <5> Wait state (wait time t_{2c}).
- <6> The Reset command is transmitted by command frame transmission processing.
- <7> A time-out check is performed from command transmission until status frame reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WTO} (MAX.)$).
- <8> The status code is checked.

When ST1 = ACK: Normal completion [A]

When ST1 \neq ACK: The retry count (t_{RS}) is checked.

The sequence is re-executed from <5> if the retry count is not over.

If the retry count is over, the processing ends abnormally [B].

6.4.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and synchronization between the programmer and the V850ES/Hx2 has been established.
Abnormal termination [B]	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	The status frame was not received within the specified time.

6.4.4 Flowchart

6.4.5 Sample program

The following shows a sample program for Reset command processing.

```

/*****
/*
/* Reset command
/*
/*****
/* [r] u16          ... error code
/*****
u16 fl_ua_reset(void)
{
    u16    rc;
    u32    retry;

    set_uart0_br(BR_9600);    // change to 9600bps

    fl_wait(tCOM_UA);        // wait
    putc_ua(0x00);           // send 0x00 @ 9600bps

    fl_wait(t12);            // wait
    putc_ua(0x00);           // send 0x00 @ 9600bps

    for (retry = 0; retry < tRS; retry++){

        fl_wait(t2C); // wait

        put_cmd_ua(FL_COM_RESET, 1, fl_cmd_prm);    // send RESET command

        rc = get_sfrm_ua(fl_ua_sfrm, tWT0_MAX);
        if (rc == FLC_DFTO_ERR)    // t.o. ?
            break;                // yes // case [C]

        if (rc == FLC_ACK){        // ACK ?
            break;                // yes // case [A]
        }
        else{
            NOP();
        }
        //continue;                // case [B] (if exit from loop)
    }
    // switch(rc) {
    //
    //     case  FLC_NO_ERR:  return rc;   break; // case [A]
    //     case  FLC_DFTO_ERR: return rc;   break; // case [C]
    //     default:          return rc;   break; // case [B]
    // }
    return rc;
}

```

6.5 Baud Rate Set Command

6.5.1 Processing sequence chart

Baud Rate Set command processing sequence

Note Do not exceed the retry count for the reset command transmission (up to 16 times).

6.5.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Baud Rate Set command is transmitted by command frame transmission processing.
- <3> Waits from command transmission until Reset command transmission (wait time t_{WT10}).
- <4> The Reset command is transmitted by command frame transmission processing.
- <5> A time-out check is performed from command transmission until status frame reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WT0} (MAX.)$).
- <6> Since the status code should be ACK, the processing ends normally [A].

6.5.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and the synchronization of the UART communication speed has been established between the programmer and the V850ES/Hx2.
Abnormal termination [B]	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Negative acknowledgment (NACK)	15H	Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	Data frame reception was timed out. With the V850ES/Hx2, this command also results in errors in the following cases. <ul style="list-style-type: none"> • Command information (parameter) is invalid • The command frame includes the checksum error • The data length of the command frame (LEN) is invalid • The footer of the command frame (ETX) is missing • The Reset command was not detected after setting the baud rate and receiving command frame data for 16 times.

6.5.4 Flowchart

6.5.5 Sample program

The following shows a sample program for Baud Rate Set command processing.

```

/*****
/*
/* Set baudrate command
/*
/*****
/* [i] u8 brid ... baudrate ID
/* [r] u16 ... error code
/*****
u16 fl_ua_setbaud(u8 brid)
{
    u16 rc;
    u8 br;
    u32 retry;

    switch(brid){
        default:
            case BR_9600: br = 0x03; break;

// }

    return rc;
}
```

6.6 Oscillating Frequency Set Command

6.6.1 Processing sequence chart

Oscillating Frequency Set command processing sequence

6.6.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Oscillating Frequency Set command is transmitted by command frame transmission processing.
- <3> A time-out check is performed from command transmission until status frame reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WT9} (MAX.)$).
- <4> The status code is checked.

When ST1 = ACK: Normal completion [A]

When ST1 \neq ACK: Abnormal termination [B]

6.6.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and the operating frequency was correctly set to the V850ES/Hx2.
Abnormal termination [B]	Parameter error	05H	The oscillation frequency value is out of range.
	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	The status frame was not received within the specified time.

6.6.4 Flowchart

6.6.5 Sample program

The following shows a sample program for Oscillating Frequency Set command processing.

```

/*****
/*
/* Set Flash device clock value command
/*
/*****

    fl_cmd_prm[1] = clk[1]; // "D02"
    fl_cmd_prm[2] = clk[2]; // "D03"
    fl_cmd_prm[3] = clk[3]; // "D04"

    fl_wait(tCOM_UA); // wait before sending command
    put_cmd_ua(FL_COM_SET_OSC_FREQ, 5, fl_cmd_prm);

    rc = get_sfrm_ua(fl_ua_sfrm, tWT9_MAX); // get status frame
    // switch(rc) {
    //
    //     case FLC_NO_ERR: return rc; break; // case [A]
    //     case FLC_DFTO_ERR: return rc; break; // case [C]
    //     default: return rc; break; // case [B]
    // }

    return rc;
}

```

6.7 Chip Erase Command

6.7.1 Processing sequence chart

Chip Erase command processing sequence

6.7.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Chip Erase command is transmitted by command frame transmission processing.
- <3> A time-out check is performed from command transmission until status frame reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WT1} (MAX.)$).
- <4> The status code is checked.

When ST1 = ACK: Normal completion [A]

When ST1 ≠ ACK: Abnormal termination [B]

6.7.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and chip erase was performed normally.
Abnormal termination [B]	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Protect error	10H	Chip erase is prohibited in the security setting.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
	WWV1 error	08H	An erase error has occurred.
	EWV1 error	0BH	
	EWV2 error	0CH	
	EWV3 error	0DH	
	Compaction search error	13H	
Sequencer error	16H	A sequencer error has occurred.	
Time-out error [C]		–	The status frame was not received within the specified time.

6.7.4 Flowchart

6.7.5 Sample program

The following shows a sample program for Chip Erase command processing.

```

/*****
/*
/* Erase all(chip) command
/*
/*****
/* [r] u16 ... error code
/*****
u16      fl_ua_erase_all(void)
{
    u16    rc;

    fl_wait(tCOM_UA);          // wait before sending command

    put_cmd_ua(FL_COM_ERASE_CHIP, 1, fl_cmd_prm); // send ERASE CHIP command

    rc = get_sfrm_ua(fl_ua_sfrm, tWT1_MAX); // get status frame
    // switch(rc) {
    //
    //     case FLC_NO_ERR: return rc; break; // case [A]
    //     case FLC_DFTO_ERR: return rc; break; // case [C]
    //     default: return rc; break; // case [B]
    // }
    return rc;
}

```

6.8 Block Erase Command

6.8.1 Processing sequence chart

Block Erase command processing sequence

6.8.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Block Erase command is transmitted by command frame transmission processing.
- <3> A time-out check is performed from command transmission until status frame reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WT2} (MAX.)$).
- <4> The status code is checked.

When ST1 = ACK: When the block erase for all of the specified blocks is not yet completed, processing changes the block number and re-executes the sequence from <1>.

When the block erase for all of the specified blocks is completed, the processing ends normally [A].

When ST1 \neq ACK: Abnormal termination [B]

6.8.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and block erase was performed normally.
Abnormal termination [B]	Parameter error	05H	The block number is out of range.
	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Protect error	10H	Write, block erase, or chip erase is prohibited in the security setting.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
	WWV1 error	08H	An erase error has occurred.
	EWV1 error	0BH	
	EWV2 error	0CH	
	EWV3 error	0DH	
	Compaction search error	13H	
Sequencer error	16H	A sequencer error has occurred.	
Time-out error [C]		–	The status frame was not received within the specified time.

6.8.4 Flowchart

6.8.5 Sample program

The following shows a sample program for Block Erase command processing for one block.

```

/*****
/*
/* Erase block command
/*
/*****
/* [i] u8 block    ... block number
/* [r] u16         ... error code
/*****
u16      fl_ua_erase_blk(u8 block)
{
    u16    rc;
    u32    wt2_max;

    fl_cmd_prm[0] = block;    // BLK
    wt2_max = get_wt2_max(get_block_size(block));

    fl_wait(tCOM_UA);        // wait before sending command

    put_cmd_ua(FL_COM_ERASE_BLOCK, 2, fl_cmd_prm); // send ERASE CHIP command

    rc = get_sfrm_ua(fl_ua_sfrm, wt2_max); // get status frame
    // switch(rc) {
    //
    //     case FLC_NO_ERR: return rc; break; // case [A]

    //     default: return rc; break; // case [B]
    // }

    return rc;
}

```

6.9 Programming Command

6.9.1 Processing sequence chart

6.9.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Programming command is transmitted by command frame transmission processing.
- <3> A time-out check is performed from command transmission until status frame reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WT3} (MAX.)$).
- <4> The status code is checked.

When ST1 = ACK: Proceeds to <5>.

When ST1 \neq ACK: Abnormal termination [B]

- <5> Waits from the previous frame reception until the next data frame transmission (wait time t_{FD3}).
- <6> User data is transmitted by data frame transmission processing.
- <7> A time-out check is performed from user data transmission until data frame reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WT4} (MAX.)$).
- <8> The status code (ST1/ST2) is checked (also refer to the processing sequence chart and flowchart).

When ST1 \neq ACK: Abnormal termination [B]

When ST1 = ACK: The following processing is performed according to the ST2 value.

- When ST2 = ACK: Proceeds to <9> when transmission of all data frames is completed.
If there still remain data frames to be transmitted, the processing re-executes the sequence from <5>.
- When ST2 \neq ACK: Abnormal termination [D]

- <9> A time-out check is performed until status frame reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WT5} (MAX.)$).
- <10> The status code is checked.

When ST1 = ACK: Normal completion [A]

When ST1 \neq ACK: Abnormal termination [E]

6.9.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and the user data was written normally.
Abnormal termination [B]	Parameter error	05H	The specified start/end address is not the start/end address of the block.
	Checksum error	07H	The checksum of the transmitted command frame or data frame does not match.
	Protect error	10H	Write is prohibited in the security setting.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> A command other than the Status command was received during processing. Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	The status frame was not received within the specified time.
Abnormal termination [D]	WWV1 error	08H (ST2)	A write error has occurred.
	Sequencer error	16H	A sequencer error has occurred.
Abnormal termination [E]	EWV4 error	11H	An internal verify error has occurred.
	Sequencer error	16H	A sequencer error has occurred.

6.10 Verify Command

6.10.1 Processing sequence chart

Verify command processing sequence

6.10.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Verify command is transmitted by command frame transmission processing.
- <3> A time-out check is performed from command transmission until status frame reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WT6} (MAX.)$).
- <4> The status code is checked.

When ST1 = ACK: Proceeds to <5>.

When ST1 ≠ ACK: Abnormal termination [B]

- <5> Waits from the previous frame reception until the next data frame transmission (wait time t_{FD3}).
- <6> User data for verifying is transmitted by data frame transmission processing.
- <7> A time-out check is performed from user data transmission until status frame reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WT7} (MAX.)$).
- <8> The status code (ST1/ST2) is checked (also refer to the processing sequence chart and flowchart).

When ST1 ≠ ACK: Abnormal termination [B]

When ST1 = ACK: The following processing is performed according to the ST2 value.

- When ST2 = ACK: If transmission of all data frames is completed, the processing ends normally [A].
If there still remain data frames to be transmitted, the processing re-executes the sequence from <5>.
- When ST2 ≠ ACK: Abnormal termination [D]

6.10.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and the verify was completed normally.
Abnormal termination [B]	Parameter error	05H	The specified start/end address is not the start/end address of the block.
	Checksum error	07H	The checksum of the transmitted command frame or data frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	The status frame was not received within the specified time.
Abnormal termination [D]	Verify error	0FH (ST2)	The verify has failed, or another error has occurred.
	Sequencer error	16H	A sequencer error has occurred.

if (is_end) // send all user data ?
    break; // yes
//continue;
}
return FLC_NO_ERR; // case [A]
}
```

6.11 Block Blank Check Command

6.11.1 Processing sequence chart

Block Blank Check command processing sequence

6.11.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Block Blank Check command is transmitted by command frame transmission processing.
- <3> A time-out check is performed from command transmission until status frame reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WTS} (MAX.)$).
- <4> The status code is checked.

When $ST1 = ACK$: If the blank check for all of the specified blocks is not yet completed, processing changes the block number and re-executes the sequence from <1>.

If the blank check for all of the specified blocks is completed, the processing ends normally [A].

When $ST1 \neq ACK$: Abnormal termination [B]

6.11.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and all of the specified blocks are blank.
Abnormal termination [B]	Parameter error	05H	The block number is out of range.
	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
	EWV4 error	11H	The specified block in the flash memory is not blank.
	Sequencer error	16H	A sequencer error has occurred.
Time-out error [C]		–	The status frame was not received within the specified time.

6.11.4 Flowchart

6.11.5 Sample program

The following shows a sample program for Block Blank Check command processing for one block.

```

/*****
/*
/* Block blank check command
/*
/*
/*****
/* [i] u8 block ... block number
/* [r] u16 ... error code
/*****
u16 fl_ua_blk_blank_chk(u8 block)
{
    u16 rc;
    u32 wt8_max;

    fl_cmd_prm[0] = block; // "BLK"
    wt8_max = get_wt8_max(get_block_size(block));

    fl_wait(tCOM_UA); // wait before sending command

    put_cmd_ua(FL_COM_BLOCK_BLANK_CHK, 2, fl_cmd_prm);

    rc = get_sfrm_ua(fl_ua_sfrm, wt8_max); // get status frame
    // switch(rc) {
    //
    //     case FLC_NO_ERR: return rc; break; // case [A]
    //     case FLC_DFTO_ERR: return rc; break; // case [C]
    //     default: return rc; break; // case [B]
    // }
    return rc;
}

```

6.12 Silicon Signature Command

6.12.1 Processing sequence chart

Silicon Signature command processing sequence

6.12.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Silicon Signature command is transmitted by command frame transmission processing.
- <3> A time-out check is performed from command transmission until status frame reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WT11} (MAX.)$).
- <4> The status code is checked.

When ST1 = ACK: Proceeds to <5>.

When ST1 \neq ACK: Abnormal termination [B]

- <5> A time-out check is performed until data frame (silicon signature data) reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{FD2} (MAX.)$).
- <6> The received data frame (silicon signature data) is checked.

If data frame is normal: Normal completion [A]

If data frame is abnormal: Data frame error [D]

6.12.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and the silicon signature was acquired normally.
Abnormal termination [B]	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	The status frame or data frame was not received within the specified time.
Data frame error [D]		–	The checksum of the data frame received as silicon signature data does not match.

6.12.4 Flowchart

6.12.5 Sample program

The following shows a sample program for Silicon Signature command processing.

```

6.16 Read Command

6.16.1 Processing sequence chart

Read command processing sequence

6.16.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Read command is transmitted by command frame transmission processing.
- <3> A time-out check is performed from command transmission until status frame reception.
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WT17} (MAX.)$).
- <4> The status code is checked.

When ST1 = ACK: Proceeds to <5>.

When ST1 \neq ACK: Abnormal termination [B]

- <5> A time-out check is performed until reception of the data frame reception result (user data).
If a time-out occurs, a time-out error [C] is returned (time-out time $t_{WT19} (MAX.)$).
- <6> The received data frame is checked.

If data frame is normal: Proceeds to <9>.

If data frame is abnormal: Proceeds to <7>.

- <7> Waits from the previous frame reception until the next status (NACK) frame transmission (wait time t_{WT19}).
- <8> The NACK frame is transmitted by data frame transmission processing.
→ A data frame error [D] is returned.
- <9> Waits from the previous frame reception until the next status (ACK) frame transmission (wait time t_{WT19}).
- <10> The ACK frame is transmitted by data frame transmission processing.
When reception of all data frames is completed, normal completion [A] is returned.
If there still remain data frames to be received, the processing re-executes the sequence from <5>.

6.16.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and read data was set normally.
Abnormal termination [B]	Parameter error	05H	The specified start/end address is not the start/end address of the block.
	Checksum error	07H	The checksum of the transmitted command frame or data frame does not match.
	Protect error	10H	Read is prohibited in the security setting.
	Negative acknowledgment (NACK)	15H	Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	The status frame or data frame was not received within the specified time.
Data frame error [D]		–	The checksum of the data frame received as read data does not match.

CHAPTER 7 3-WIRE SERIAL I/O COMMUNICATION MODE WITH HANDSHAKE SUPPORTED (CSI + HS)

7.1 Command Frame Transmission Processing Flowchart

7.2 Data Frame Transmission Processing Flowchart

7.3 Data Frame Reception Processing Flowchart

7.4 Status Command

7.4.1 Processing sequence chart

Status command processing sequence

7.4.2 Description of processing sequence

- <1> The Status command is transmitted by command frame transmission processing.
- <2> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{SF (MAX.)}$).
- <3> The status code is checked.

When ST1 = ACK: Normal completion [A]
 When ST1 ≠ ACK: Abnormal termination [B]

7.4.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The status frame transmitted from the V850ES/Hx2 has been received normally.
Abnormal termination [B]	Command error	04H	An unsupported command or abnormal frame has been received.
	Parameter error	05H	Command information (parameter) is invalid.
	Checksum error	07H	The data of the frame transmitted from the programmer is abnormal.
	WWV1 error	08H	Write error
	EWV1 error	0BH	Erase error
	EWV2 error	0CH	
	EWV3 error	0DH	
	Verify error	0EH	A verify error has occurred for the data of the frame transmitted from the programmer.
		0FH	
	Protect error	10H	An attempt was made to execute processing prohibited by the Security Set command.
	EWV4 error	11H	Internal verify error/blank error
	Compaction search error	13H	Erase error
	Negative acknowledgment (NACK)	15H	Negative acknowledgment
Sequencer error	16H	A sequencer error has occurred.	
Time-out error [C]	-	Processing timed out due to the busy status at the HS pin.	

7.4.4 Flowchart

7.4.5 Sample program

The following shows a sample program for Status command processing.

```

/*****
/*
/* Get status command (CSI-HS)
/*

```

7.5 Reset Command

7.5.1 Processing sequence chart

Reset command processing sequence

Note Do not exceed the retry count for the reset command transmission (up to 16 times).

7.5.2 Description of processing sequence

- <1> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{COM(MAX)}$).
- <2> The Reset command is transmitted by command frame transmission processing.
- <3> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{WTO(MAX)}$).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends normally: Normal completion [A]
 When the processing ends abnormally: The sequence is re-executed from <1> if the retry count is not over.
 If the retry count is over, the processing ends abnormally [B].
 When a time-out error occurs: A time-out error [C] is returned.

7.5.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and synchronization between the programmer and the V850ES/Hx2 has been established.
Abnormal termination [B]	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	Status check processing timed out. Processing timed out due to the busy status at the HS pin.

7.5.4 Flowchart

7.5.5 Sample program

7.6 Oscillating Frequency Set Command

7.6.1 Processing sequence chart

Oscillating Frequency Set command processing sequence

7.6.2 Description of processing sequence

- <1> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{COM}(MAX.)$).
- <2> The Oscillating Frequency Set command is transmitted by command frame transmission processing.
- <3> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{WT9}(MAX.)$).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends normally: Normal completion [A]
 When the processing ends abnormally: Abnormal termination [B]
 When a time-out error occurs: A time-out error [C] is returned.

7.6.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and the operating frequency was correctly set to the V850ES/Hx2.
Abnormal termination [B]	Parameter error	05H	The oscillation frequency value is out of range.
	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		-	Processing timed out due to the busy status at the HS pin.

7.6.4 Flowchart

    // }
    return rc;
}

```

7.8 Block Erase Command

7.8.1 Processing sequence chart

Block Erase command processing sequence

7.8.2 Description of processing sequence

- <1> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{COM(MAX)}$).
- <2> The Block Erase command is transmitted by command frame transmission processing.
- <3> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{WT2(MAX)}$).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends normally: When the block erase for all of the specified blocks is not yet completed, processing changes the block number and re-executes the sequence from <1>.

When the block erase for all of the specified blocks is completed, the processing ends normally [A].

When the processing ends abnormally: Abnormal termination [B]

When a time-out error occurs: A time-out error [C] is returned.

7.8.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and block erase was performed normally.
Abnormal termination [B]	Parameter error	05H	The block number is out of range.
	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Protect error	10H	Chip erase is prohibited in the security setting.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
	WWV1 error	08H	An erase error has occurred.
	EWV1 error	0BH	
	EWV2 error	0CH	
	EWV3 error	0DH	
	Compaction search error	13H	
Sequencer error	16H	A sequencer error has occurred.	
Time-out error [C]		–	Processing timed out due to the busy status at the HS pin.

7.8.4 Flowchart

7.8.5 Sample program

The following shows a sample program for Block Erase command processing for one block.

```

/*****
/*
/* Erase block command (CSI-HS)
/*
/*

    // }
    return rc;
}

```

7.9 Programming Command

7.9.1 Processing sequence chart

7.9.2 Description of processing sequence

- <1> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{COM}(MAX.)$).
- <2> The Programming command is transmitted by command frame transmission processing.
- <3> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{WT3}(MAX.)$).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends normally: Proceeds to <6>.
When the processing ends abnormally: Abnormal termination [B]
When a time-out error occurs: A time-out error [C] is returned.

- <6> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{FD3}(MAX.)$).
- <7> User data is transmitted by data frame transmission processing.
- <8> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{WT4}(MAX.)$).
- <9> The status frame is acquired by status check processing.
- <10> The following processing is performed according to the result of status check processing (status code (ST1/ST2)) (also refer to the processing sequence chart and flowchart).

When ST1 = abnormal termination: Abnormal termination [B]
When ST1 = time-out error: A time-out error [C] is returned.
When ST1 = normal completion: The following processing is performed according to the ST2 value.

- When ST2 \neq ACK: Abnormal termination [D]
- When ST2 = ACK: Proceeds to <11> when transmission of all of the user data is completed.
If there still remain user data to be transmitted, the processing re-executes the sequence from <6>.

- <11> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{WT5}(MAX.)$).
- <12> The status frame is acquired by status check processing.
- <13> The following processing is performed according to the result of status check processing.

When the processing ends normally: Normal completion [A]
(Indicating that the internal verify check has performed normally after completion of write)

When the processing ends abnormally: Abnormal termination [E]
(Indicating that the internal verify check has not performed normally after completion of write)

When a time-out error occurs: A time-out error [C] is returned.

7.9.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and the user data was written normally.
Abnormal termination [B]	Parameter error	05H	The specified start/end address is not the start/end address of the block.
	Checksum error	07H	The checksum of the transmitted command frame or data frame does not match.
	Protect error	10H	Write is prohibited in the security setting.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> A command other than the Status command was received during processing. Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	Processing timed out due to the busy status at the HS pin.
Abnormal termination [D]	WWV1 error	08H (ST2)	A write error has occurred.
	Sequencer error	16H	A sequencer error has occurred.
Abnormal termination [E]	EWV4 error	11H	An internal verify error has occurred.
	Sequencer error	16H	A sequencer error has occurred.

7.10.2 Description of processing sequence

- <1> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{COM}(MAX.)$).
- <2> The Verify command is transmitted by command frame transmission processing.
- <3> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{WT6}(MAX.)$).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends normally: Proceeds to <6>.
 When the processing ends abnormally: Abnormal termination [B]
 When a time-out error occurs: A time-out error [C] is returned.

- <6> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{FD3}(MAX.)$).
- <7> User data for verifying is transmitted by data frame transmission processing.
- <8> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{WT7}(MAX.)$).
- <9> The status frame is acquired by status check processing.
- <10> The following processing is performed according to the result of status check processing (status code (ST1/ST2)) (also refer to the processing sequence chart and flowchart).

When ST1 = abnormal termination: Abnormal termination [B]
 When ST1 = time-out error: A time-out error [C] is returned.
 When ST1 = normal completion: The following processing is performed according to the ST2 value.

- When ST2 = ACK: If transmission of all data frames is completed, the processing ends normally [A].
If there still remain data frames to be transmitted, the processing re-executes the sequence from <6>.
- When ST2 \neq ACK: Abnormal termination [D]

7.10.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and the verify was completed normally.
Abnormal termination [B]	Parameter error	05H	The specified start/end address is not the start/end address of the block.
	Checksum error	07H	The checksum of the transmitted command frame or data frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	Processing timed out due to the busy status at the HS pin.
Abnormal termination [D]	Verify error	0FH (ST2)	The verify has failed, or another error has occurred.
		0EH	
	Sequencer error	16H	A sequencer error has occurred.

7.11 Block Blank Check Command

7.11.1 Processing sequence chart

Block Blank Check command processing sequence

7.11.2 Description of processing sequence

- <1> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{COM(MAX)}$).
- <2> The Block Blank Check command is transmitted by command frame transmission processing.
- <3> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{WT8(MAX)}$).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends abnormally: Abnormal termination [B]
 When the processing ends normally: If the blank check for all of the specified blocks is completed, the processing ends normally [A].
 If the blank check for all of the specified blocks is not yet completed, processing changes the block number and re-executes the sequence from <1>.
 When a time-out error occurs: A time-out error [C] is returned.

7.11.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and all of the specified blocks are blank.
Abnormal termination [B]	Parameter error	05H	The block number is out of range.
	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
	EWV4 error	11H	The specified block in the flash memory is not blank.
	Sequencer error	16H	A sequencer error has occurred.
Time-out error [C]		–	Processing timed out due to the busy status at the HS pin.

7.11.4 Flowchart

7.16 Read Command

7.16.1 Processing sequence chart

Read command processing sequence

7.16.2 Description of processing sequence

- <1> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{COM}(MAX.)$).
- <2> The Read command is transmitted by command frame transmission processing.
- <3> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{WT17}(MAX.)$).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends normally: Proceeds to <6>.

When the processing ends abnormally: Abnormal termination [B]

When a time-out error occurs: A time-out error [C] is returned.

- <6> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{WT18}(MAX.)$).
- <7> The data frame (user data) in the flash memory is received by data frame reception processing.

When the processing ends normally: Proceeds to <10>.

When an error such as checksum error occurs: Proceeds to <8>.

When a time-out error occurs: A time-out error [C] is returned.

- <8> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{WT19}(MAX.)$).
- <9> The NACK frame is transmitted by data frame transmission processing.
A data frame error [D] is returned.
- <10> A V850ES/Hx2 BUSY status is checked using the HS pin.
If a BUSY time-out occurs, a time-out error [C] is returned (time-out time $t_{WT19}(MAX.)$).
- <11> The ACK frame is transmitted by data frame transmission processing.
When reception of all data frames is completed, the normal completion status [A] is returned.
If there still remain data frames to be received, the sequence is re-executed from <6>.

7.16.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and the read data was set normally.
Abnormal termination [B]	Parameter error	05H	The specified start/end address is not the start/end address of the block.
	Checksum error	07H	The checksum of the transmitted command frame or data frame does not match.
	Protect error	10H	Read is prohibited in the security setting.
	Negative acknowledgment (NACK)	15H	Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	Processing timed out due to the busy status at the HS pin.
Data frame error [D]		–	The checksum of the data frame received as read data does not match.

CHAPTER 8 3-WIRE SERIAL I/O COMMUNICATION MODE (CSI)

8.1 Command Frame Transmission Processing Flowchart

8.2 Data Frame Transmission Processing Flowchart

8.3 Data Frame Reception Processing Flowchart

8.4 Status Command

8.4.1 Processing sequence chart

Status command processing sequence

Note Applied specifications differ depending on the command executed.

8.4.2 Description of processing sequence

- <1> The Status command is transmitted by command frame transmission processing.
- <2> Waits from command transmission until status frame reception (wait time t_{SF}).
- <3> The status code is checked.

When ST1 = ACK: Normal completion [A]

When ST1 = BUSY: A time-out check is performed. The time-out time ($t_{WTrn(MAX.)}$) is given as a parameter for this processing.

If the processing is not timed out, the sequence is re-executed from <1>.

If a time-out occurs, a time-out error [C] is returned.

When ST1 ≠ ACK, BUSY: Abnormal termination [B]

8.4.3 Status at processing completion

Status at Processing Completion		Status Code	Description	
Normal completion [A]	Normal acknowledgment (ACK)	06H	The status frame transmitted from the V850ES/Hx2 has been received normally.	
Abnormal termination [B]	Command error	04H	An unsupported command or abnormal frame has been received.	
	Parameter error	05H	Command information (parameter) is invalid.	
	Checksum error	07H	The data of the frame transmitted from the programmer is abnormal.	
	WWV1 error	08H	Write error	
	EWV1 error	0BH	Erase error	
	EWV2 error	0CH		
	EWV3 error	0DH		
	Verify error		0EH	A verify error has occurred for the data of the frame transmitted from the programmer.
			0FH	
	Protect error		10H	An attempt was made to execute processing prohibited by the Security Set command.
	EWV4 error		11H	Internal verify error/blank error
	Compaction search error		13H	Erase error
	Negative acknowledgment (NACK)		15H	Negative acknowledgment
Sequencer error		16H	A sequencer error has occurred.	
Time-out error [C]		–	After command transmission, the specified time has elapsed but a BUSY response is still returned.	

8.4.4 Flowchart

8.4.5 Sample program

The following shows a sample program for Status command processing.

```

/*****
/*

// }  
return rc;  
  
}
```

8.5 Reset Command

8.5.1 Processing sequence chart

Reset command processing sequence

Note Do not exceed the retry count for the reset command transmission (up to 16 times).

8.5.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Reset command is transmitted by command frame transmission processing.
- <3> Waits from command transmission until status check processing (wait time $t_{WTO} (MAX.)$).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends normally: Normal completion [A]

When the processing ends abnormally: The sequence is re-executed from <1> if the retry count is not over.
If the retry count is over, the processing ends abnormally [B].

When a time-out error occurs: A time-out error [C] is returned.

8.5.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and synchronization between the programmer and the V850ES/Hx2 has been established.
Abnormal termination [B]	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	Status check processing timed out.

8.5.4 Flowchart

8.5.5 Sample program

    // }
    return rc;
}

```

8.9 Programming Command

8.9.1 Processing sequence chart

Programming command processing sequence

8.9.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Programming command is transmitted by command frame transmission processing.
- <3> Waits from command transmission until status check processing (wait time t_{WT3} (MAX.)).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends normally: Proceeds to <6>.
 When the processing ends abnormally: Abnormal termination [B]
 When a time-out error occurs: A time-out error [C] is returned.

- <6> Waits until the next data frame transmission (wait time t_{FD3} (MAX.)).
- <7> User data to be written to the V850ES/Hx2 flash memory is transmitted by data frame transmission processing.
- <8> Waits from data frame (user data) transmission until status check processing (wait time t_{WT4} (MAX.)).
- <9> The status frame is acquired by status check processing.
- <10> The following processing is performed according to the result of status check processing (status code (ST1/ST2)) (also refer to the processing sequence chart and flowchart).

When ST1 = abnormal termination: Abnormal termination [B]
 When ST1 = time-out error: A time-out error [C] is returned.
 When ST1 = normal completion: The following processing is performed according to the ST2 value.

- When ST2 \neq ACK: Abnormal termination [D]
- When ST2 = ACK: Proceeds to <11> when transmission of all of the user data is completed.
 If there still remain user data to be transmitted, the processing re-executes the sequence from <6>.

- <11> Waits until status check processing (time-out time t_{WT5} (MAX.)).
- <12> The status frame is acquired by status check processing.
- <13> The following processing is performed according to the result of status check processing.

When the processing ends normally: Normal completion [A]
 (Indicating that the internal verify check has performed normally after completion of write)
 When the processing ends abnormally: Abnormal termination [E]
 (Indicating that the internal verify check has not performed normally after completion of write)
 When a time-out error occurs: A time-out error [C] is returned.

8.9.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and the user data was written normally.
Abnormal termination [B]	Parameter error	05H	The specified start/end address is not the start/end address of the block.
	Checksum error	07H	The checksum of the transmitted command frame or data frame does not match.
	Protect error	10H	Write is prohibited in the security setting.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	The status frame was not received within the specified time.
Abnormal termination [D]	WWV1 error	08H (ST2)	A write error has occurred.
	Sequencer error	16H	A sequencer error has occurred.
Abnormal termination [E]	EWV4 error	11H	An internal verify error has occurred.
	Sequencer error	16H	A sequencer error has occurred.

8.10 Verify Command

8.10.1 Processing sequence chart

Verify command processing sequence

8.10.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Verify command is transmitted by command frame transmission processing.
- <3> Waits from command transmission until status check processing (wait time $t_{WT6} (MAX.)$).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends normally: Proceeds to <6>.
 When the processing ends abnormally: Abnormal termination [B]
 When a time-out error occurs: A time-out error [C] is returned.

- <6> Waits from the previous frame reception until the next data frame transmission (wait time t_{FD3}).
- <7> User data for verifying is transmitted by data frame transmission processing.
- <8> Waits from data frame transmission until status check processing (wait time $t_{WT7} (MAX.)$).
- <9> The status frame is acquired by status check processing.
- <10> The following processing is performed according to the result of status check processing (status code (ST1/ST2)) (also refer to the processing sequence chart and flowchart).

When ST1 = abnormal termination: Abnormal termination [B]
 When ST1 = time-out error: A time-out error [C] is returned.
 When ST1 = normal completion: The following processing is performed according to the ST2 value.

- When ST2 \neq ACK: Abnormal termination [D]
- When ST2 = ACK: If transmission of all data frames is completed, the processing ends normally [A].
 If there still remain data frames to be transmitted, the processing re-executes the sequence from <6>.

8.10.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and the verify was completed normally.
Abnormal termination [B]	Parameter error	05H	The specified start/end address is not the start/end address of the block.
	Checksum error	07H	The checksum of the transmitted command frame or data frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	The status frame was not received within the specified time.
Abnormal termination [D]	Verify error	0FH (ST2)	The verify has failed, or another error has occurred.
		0EH	
	Sequencer error	16H	A sequencer error has occurred.

8.10.4 Flowchart

8.10.5 Sample program

The following shows a sample program for Verify command processing.

```

/*****
/*
/* Verify command (CSI)
/*
/*
/*****
/* [i] u32 top ... start address
/* [i] u32 bottom ... end address
/* [i] u8 *buf ... pointer to verify data buffer

        break;    // yes
    //continue;

}
return FLC_NO_ERR;    // case [A]

}

```

8.11 Block Blank Check Command

8.11.1 Processing sequence chart

Block Blank Check command processing sequence

8.11.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Block Blank Check command is transmitted by command frame transmission processing.
- <3> Waits from command transmission until status check processing (wait time $t_{WT8} (MAX.)$).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When a time-out error occurs: A time-out error [C] is returned.

When the processing ends abnormally: Abnormal termination [B]

When the processing ends normally: If the blank check for all of the specified blocks is not yet completed, processing changes the block number and re-executes the sequence from <1>.

If the blank check for all of the specified blocks is completed, the processing ends normally [A].

8.11.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and all of the specified blocks are blank.
Abnormal termination [B]	Parameter error	05H	The block number is out of range.
	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
	EWV4 error	11H	The specified block in the flash memory is not blank.
	Sequencer error	16H	A sequencer error has occurred.
Time-out error [C]		–	The status frame was not received within the specified time.

8.11.4 Flowchart

8.11.5 Sample program

The following shows a sample program for Block Blank Check command processing for one block.

```

/*****
/*
/* Block blank check command (CSI)
/*
/*****
/* [i] u8 block ... block number
/* [r] u16 ... error code
/*****
u16 fl_csi_blk_blank_chk(u8 block)
{
    u16 rc;
    u32 wt8, wt8_max;

    fl_cmd_prm[0] = block; // "BLK"
    wt8 = get_wt8(get_block_size(block));
    wt8_max = get_wt8_max(get_block_size(block));

    fl_wait(tCOM_CSI); // wait before sending command frame

    put_cmd_csi(FL_COM_BLOCK_BLANK_CHK, 2, fl_cmd_prm);
    // send "Block Blank Check" command

    fl_wait(wt8);

    rc = fl_csi_getstatus(wt8_max); // get status frame
    // switch(rc) {
    //
    //     case FLC_NO_ERR: return rc; break; // case [A]
    //     case FLC_DFTO_ERR: return rc; break; // case [C]
    //     default: return rc; break; // case [B]
    // }
    return rc;
}

```

8.12 Silicon Signature Command

8.12.1 Processing sequence chart

Silicon Signature command processing sequence

8.12.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Silicon Signature command is transmitted by command frame transmission processing.
- <3> Waits from command transmission until status check processing (wait time $t_{WT11} (MAX.)$).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends normally: Proceeds to <6>.
 When the processing ends abnormally: Abnormal termination [B]
 When a time-out error occurs: A time-out error [C] is returned.

- <6> Waits from the previous frame reception until the next command transmission (wait time t_{FD2}).
- <7> The received data frame (silicon signature data) is checked.

If data frame is normal: Normal completion [A]
 If data frame is abnormal: Data frame error [D]

8.12.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and the silicon signature was acquired normally.
Abnormal termination [B]	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	The status frame was not received within the specified time.
Data frame error [D]		–	The checksum of the data frame received as silicon signature data does not match.

8.12.4 Flowchart

8.14 Checksum Command

8.14.1 Processing sequence chart

Checksum command processing sequence

8.14.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Checksum command is transmitted by command frame transmission processing.
- <3> Waits from command transmission until status check processing (wait time $t_{WT16} (MAX.)$).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends normally: Proceeds to <6>.
 When the processing ends abnormally: Abnormal termination [B]
 When a time-out error occurs: A time-out error [C] is returned.

- <6> Waits from the previous frame reception until the next command transmission (wait time t_{FD1}).
- <7> The received data frame (checksum data) is checked.

If data frame is normal: Normal completion [A]
 If data frame is abnormal: Data frame error [D]

8.14.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and checksum data was acquired normally.
Abnormal termination [B]	Parameter error	05H	The specified start/end address is not the start/end address of the block.
	Checksum error	07H	The checksum of the transmitted command frame does not match.
	Negative acknowledgment (NACK)	15H	<ul style="list-style-type: none"> • A command other than the Status command was received during processing. • Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	The status frame was not received within the specified time.
Data frame error [D]		–	The checksum of the data frame received as version data does not match.

8.14.4 Flowchart

8.14.5 Sample program

The following shows a sample program for Checksum command processing.

8.15 Security Set Command

8.15.1 Processing sequence chart

Security Set command processing sequence

8.15.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Security Set command is transmitted by command frame transmission processing.
- <3> Waits from command transmission until status check processing (wait time t_{WT13} (MAX.)).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends normally: Proceeds to <6>.
 When the processing ends abnormally: Abnormal termination [B]
 When a time-out error occurs: A time-out error [C] is returned.

- <6> Waits from the previous frame reception until the data frame transmission (wait time t_{FD3}).
- <7> The data frame (security setting data) is transmitted by data frame transmission processing.
- <8> Waits from data frame transmission until status check processing (wait time t_{WT14} (MAX.)).
- <9> The status frame is acquired by status check processing.
- <10> The following processing is performed according to the result of status check processing.

When the processing ends normally: Proceeds to <11>.
 When the processing ends abnormally: Abnormal termination [D]
 When a time-out error occurs: A time-out error [C] is returned.

- <11> Waits until status acquisition (completion of internal verify) (wait time t_{WT15} (MAX.)).
- <12> The status frame is acquired by status check processing.
- <13> The following processing is performed according to the result of status check processing.

When the processing ends normally: Normal completion [A]
 When the processing ends abnormally: Abnormal termination [E]
 When a time-out error occurs: A time-out error [C] is returned.

8.15.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and security setting was performed normally.
Abnormal termination [B]	Parameter error	05H	The command information (parameter) is not 00H.
	Checksum error	07H	The checksum of the transmitted command frame or data frame does not match.
	Protect error	10H	The ID codes do not match.
	Negative acknowledgment (NACK)	15H	Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		-	The status frame was not received within the specified time.
Abnormal termination [D]	WWV1 error	08H	<ul style="list-style-type: none"> • Security data is already set. • A security data write error has occurred.
	Sequencer error	16H	A sequencer error has occurred.
Abnormal termination [E]	EWV4 error	11H	An internal verify error has occurred.
	Sequencer error	16H	A sequencer error has occurred.

//    default: return rc; break; // case [B]
// }
return rc;
}
```

8.16 Read Command

8.16.1 Processing sequence chart

Read command processing sequence

8.16.2 Description of processing sequence

- <1> Waits from the previous frame reception until the next command transmission (wait time t_{COM}).
- <2> The Read command is transmitted by command frame transmission processing.
- <3> Waits from command transmission until status check processing (wait time t_{WT17}).
- <4> The status frame is acquired by status check processing.
- <5> The following processing is performed according to the result of status check processing.

When the processing ends normally: Proceeds to <6>.
 When the processing ends abnormally: Abnormal termination [B]
 When a time-out error occurs: A time-out error [C] is returned.

- <6> Waits from the previous frame reception until the data frame reception (wait time t_{WT18}).
- <7> The data frame (user data) is received by data frame reception processing.
 The following processing is performed according to the result of reception processing.

When the processing ends normally: Proceeds to <10>.
 When the processing ends abnormally: Proceeds to <8>.

- <8> Waits from the previous frame reception until the next status (NACK) frame transmission (wait time t_{WT19}).
- <9> The NACK frame is transmitted by data frame transmission processing.
 A data frame error [D] is returned.
- <10> Waits from the previous frame reception until the next status (ACK) frame transmission (wait time t_{WT19}).
- <11> The ACK frame is transmitted by data frame transmission processing.
 When reception of all data frames is completed, the normal completion status [A] is returned.
 If there still remain data frames to be received, the sequence is re-executed from <5>.

8.16.3 Status at processing completion

Status at Processing Completion		Status Code	Description
Normal completion [A]	Normal acknowledgment (ACK)	06H	The command was executed normally and read data was set normally.
Abnormal termination [B]	Parameter error	05H	The specified start/end address is not the start/end address of the block.
	Checksum error	07H	The checksum of the transmitted command frame or data frame does not match.
	Protect error	10H	Read is prohibited in the security setting.
	Negative acknowledgment (NACK)	15H	Command frame data is abnormal (such as invalid data length (LEN) or no ETX).
Time-out error [C]		–	The status frame or data frame was not received within the specified time.
Data frame error [D]		–	The checksum of the data frame received as read data does not match.

break; // yes
}

return FLC_NO_ERR;
}

```

CHAPTER 9 FLASH MEMORY PROGRAMMING PARAMETER CHARACTERISTICS

This chapter describes the parameter characteristics between the programmer and the V850ES/Hx2 in the flash memory programming mode.

Be sure to refer to the user's manual of the V850ES/Hx2 for electrical specifications when designing a programmer.

<Operating clock (fx)>

The internal clock of the V850ES/Hx2 is changed according to the value of the oscillation frequency (fx) specified with the Oscillation Frequency Set command by the programmer.

$$4.0 \text{ MHz} \leq f_x \leq 5.0 \text{ MHz: } f_{xx} = f_x \times 4$$

Therefore, it is obtained by assigning f_x until t_{WT9} of the Oscillation Frequency Set command and assigning f_{xx} after t_{WT9} .

9.1 Flash Memory Programming Mode Setting Time

Parameter	Symbol	MIN.	TYP.	MAX.
$V_{DD}\uparrow$ to FLMD0/FLMD1 \uparrow	t_{DP}	1 ms		
FLMD0/FLMD1 \uparrow to $\overline{\text{RESET}}\uparrow$	t_{PR}	2 ms		
Count start time from $\overline{\text{RESET}}\uparrow$ to FLMD0 ^{Note 1}	t_{RP}	66,920/ f_x		
Count finish time from $\overline{\text{RESET}}\uparrow$ to FLMD0 ^{Note 1}	t_{RPE}			139,566/ f_x
FLMD0 counter high-level/low-level width	t_{PW}	10 μs		100 μs
Wait for Reset command (CSI/CSI + HS)	t_{RC}	148,103/ f_x		3 s
Wait for low-level data 1 (UART)	t_{R1}	148,103/ f_x		3 s
Wait for low-level data 2 (UART)	t_{2C}	30,000/ f_x		3 s
Wait for Read command (UART)	t_{12}	30,000/ f_x		3 s
Width of low-level data 1/2 ^{Note 2}	t_{L1}, t_{L2}		Note 2	
FLMD0 counter rise/fall time	—			1 μs

Notes 1. $(66,920/f_x + 139,566/f_x)/2$ is recommended as the standard value for the FLMD0 pulse input timing.

2. The low-level width is the same as the 00H data width at 9,600 bps.

9.2 Programming Characteristics

Wait	Condition	Symbol	Serial I/F	MIN.	MAX.
Between data frame transmission/reception	Data frame reception	t_{DR}	CSI	125/f _x	3 s
			UART	125/f _x	3 s
	Data frame transmission	t_{DT}	CSI	127/f _x	3 s
			UART	0	3 s
From Status command frame reception until status frame transmission	–	t_{SF}	CSI	Note 1	
From status frame transmission until data frame transmission (1)	–	t_{FD1}	CSI	55,920/f _x + 33,802/ f _x × N	3 s
			UART	0	3 s
From status frame transmission until data frame transmission (2)	–	t_{FD2}	CSI	2,998/f _x	3 s
			UART	0 ^{Note 2}	3 s
From status frame transmission until data frame reception	–	t_{FD3}	CSI	168/f _x	3 s
			UART	168/f _x	3 s
From status frame transmission until command frame reception	–	t_{COM}	CSI	154/f _x	3 s
			UART	120/f _x	3 s

Notes 1. t_{SF} MIN. values and MAX. values for respective commands

Command	MIN.	MAX.
Reset, Read, Oscillating Frequency Set, Checksum, Silicon Signature, Version Get	241/f _x	3 s
Chip Erase	936/f _x	3 s
Block Erase	807/f _x	3 s
Programming	12,960/f _x	3 s
Verify	4,584/f _x	3 s
Block Blank Check	12,960/f _x	3 s
Security Set	826/f _x	3 s

2. When continuous reception is enabled for the programmer

Remarks 1. N: Command execution block size (KB)

2. The waits are defined as follows.

< t_{DR} , t_{FD3} , t_{COM} >

The V850ES/Hx2 is readied for the next communication after the MIN. time has elapsed after completion of the previous communication.

The programmer must transmit the next data between the MIN. and MAX. time after completion of the previous communication.

< t_{DT} , t_{SF} , t_{FD1} , t_{FD2} >

The V850ES/Hx2 is readied for the next communication after the MIN. time has elapsed after completion of the previous communication.

The programmer must receive the next data between the MIN. and MAX. time after completion of the previous communication.

Command	Symbol	Serial I/F	MIN.	MAX.
Reset	t _{WT0}	CSI	199/f _x	3 s
		UART	Note 1	3 s
Chip Erase	t _{WT1}	–	[μ PD70F3700, 70F3701] 32,088,940/f _{cx} + 820.8 ms	[μ PD70F3700, 70F3701] 550,375,712/f _{cx} + 16,242/f _x + 35,410 ms
		–	[μ PD70F3702, 70F3703, 70F3704, 70F3706, 70F3707] 64,177,880/f _{cx} + 1,641.6 ms	[μ PD70F3702, 70F3703, 70F3704, 70F3706, 70F3707] 1,313,350,208/f _{cx} + 19,130/f _x + 70,820 ms
		–	[μ PD70F3709, 70F3710, 70F3711, 70F3712] 128,355,760/f _{cx} + 3,283.2 ms	[μ PD70F3709, 70F3710, 70F3711, 70F3712] 3,477,095,552/f _{cx} + 24,906/f _x + 141,640 ms
Block Erase	t _{WT2}	–	(5.2 ms + 125,147/f _{cx}) + (6.25 ms + 246,784/f _{cx}) × N	25,570/f _x + (282.9 ms + 1,836,104/f _{cx}) + (267.8 ms + 3,619,584/f _{cx}) × N
Programming	t _{WT3}	CSI	12,768/f _x	3 s
		UART	Note 1	3 s
	t _{WT4}	–	971.3 μ s + 29,818/f _{cx}	49.5 ms + 367,079/f _{cx}
	t _{WT5}	CSI	98,400/f _{cx} × N	123,000/f _{cx} × N
		UART	Note 1	123,000/f _{cx} × N
Verify	t _{WT6}	CSI	407/f _{cx}	3 s
		UART	Note 1	3 s
	t _{WT7}	CSI	28,128/f _x	3 s
		UART	Note 1	3 s
Block Blank Check	t _{WT8}	–	44,904/f _{cx} × N	(811,400 + 2,777,554 × N)/f _{cx} + 21,611/f _x
Oscillating Frequency Set	t _{WT9}	CSI	6,199/f _x + 2 ¹⁹ /f _x	3 s
		UART	Note 1	3 s
Baud Rate Set	t _{WT10}	UART	4,488/f _x	3 s
Silicon Signature	t _{WT11}	CSI	557/f _x	3 s
		UART	Note 1	3 s
Version Get	t _{WT12}	CSI	570/f _x	3 s
		UART	Note 1	3 s
Security Set	t _{WT13}	CSI	461/f _x	3 s
		UART	Note 1	3 s
	t _{WT14}	–	16,114/f _x + 364.3 μ s + 11,295/f _{cx}	17,266/f _x + 49.5 ms + 367,079/f _{cx}
	t _{WT15}	CSI	11,834,400/f _{cx}	147,930,960/f _{cx}
UART		Note 1	147,930,960/f _{cx}	
Checksum	t _{WT16}	CSI	691/f _x	3 s
		UART	Note 1	3 s
Read	t _{WT17}	CSI	12,903/f _x	3 s
		UART	Note 1	3 s
	t _{WT18}	CSI	21,466/f _x	3 s
		UART	Note 1	3 s
	t _{WT19}	–	Note 2	Note 2

Note 1. Reception must be enabled for the programmer before command transmission.

2. Time until the programmer transmits "ACK".

Remarks 1. N: Command execution block size (K byte)

fcx: fxx

2. The waits are defined as follows.

<tw_{T0} to tw_{T16}>

The V850ES/Hx2 completes command processing within the MIN. to MAX. time.

The programmer must repeat the status check until the MAX. time is elapsed.
