

## 2-Port SS/HS USB Controller Hub

## **Highlights**

- USB Hub Feature Controller IC with 2 USB 3.1 Gen 1 / USB 2.0 downstream ports
- USB-IF Battery Charger revision 1.2 support on up & downstream ports (DCP, CDP, SDP)
- USB Link Power Management (LPM) support
- Enhanced OEM configuration options available through either OTP or SPI ROM
- Available in 56-pin (7 x 7 mm) SQFN lead-free, RoHS compliant package
- Commercial and industrial grade temperature support
- Configuration Straps: Predefined configuration of system level functions

## **Target Applications**

- · Standalone USB Hubs
- · Laptop Docks
- PC Motherboards
- PC Monitor Docks
- · Multi-function USB 3.1 Gen 1 Peripherals

## **Key Benefits**

- USB 3.1 Gen 1 compliant 5 Gbps, 480 Mbps, 12 Mbps and 1.5 Mbps operation
  - 5 V tolerant USB 2.0 pins
  - 1.32 V tolerant USB 3.1 Gen 1 pins
  - Integrated termination & pull-up/pull-down resistors
- Supports per port battery charging of most popular battery powered devices
  - USB-IF Battery Charging rev. 1.2 support (DCP, CDP, SDP)
  - Apple® portable product charger emulation
  - Chinese YD/T 1591-2006 charger emulation
  - Chinese YD/T 1591-2009 charger emulation
  - European Union universal mobile charger support
  - Support for Microchip USC100x family of battery charging controllers
  - Supports additional portable devices
- · Smart port controller operation
  - Firmware handling of companion port controllers
- · On-chip microcontroller
- Manages I/Os, VBUS, and other signals
- 8 KB RAM, 64 KB ROM
- 8 KB One Time Programmable (OTP) ROM
  - Includes on-chip charge pump
- Configuration programming via OTP ROM, SPI ROM, or SMBus
- PortSwap
  - Configurable differential intro-pair signal swapping
- PHYBoost<sup>™</sup>
  - Programmable USB transceiver drive strength for recovering signal integrity
- VariSense<sup>™</sup>
  - Programmable USB receiver sensitivity
- Compatible with Microsoft Windows 8, 7, XP, Apple OS X 10.4+, and Linux hub drivers
- Optimized for low-power operation and low thermal dissipation
- Package
  - 56-pin SQFN (7 x 7 mm)
- Environmental
  - 3 kV HBM JESD22-A114F ESD protection
  - Commercial temperature range (0°C to +70°C)

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com. We welcome your feedback.

#### **Most Current Documentation**

To obtain the most up-to-date version of this documentation, please register at our Worldwide Web site at:

#### http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

#### **Errata**

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; http://www.microchip.com
- · Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include -literature number) you are using.

## **Customer Notification System**

Register on our web site at www.microchip.com to receive the most current information on all of our products.

TABLE 1-1: GENERAL TERMS

Term	Description				
ADC	Analog-to-Digital Converter				
Byte	8 bits				
CDC	Communication Device Class				
CSR	Control and Status Registers				
DWORD	32 bits				
EOP	End of Packet				
EP	Endpoint				
FIFO	First In First Out buffer				
FS	Full-Speed				
FSM	Finite State Machine				
GPIO	General Purpose I/O				
HS	Hi-Speed				
HSOS	High Speed Over Sampling				
Hub Feature Controller	The Hub Feature Controller, sometimes called a Hub Controller for short is the internal processor used to enable the unique features of the USB Controller Hub. This is not to be confused with the USB Hub Controller that is used to communicate the hub status back to the Host during a USB session.				
I <sup>2</sup> C	Inter-Integrated Circuit				
LS	Low-Speed				
Isb	Least Significant Bit				
LSB	Least Significant Byte				
msb	Most Significant Bit				
MSB	Most Significant Byte				
N/A	Not Applicable				
NC	No Connect				
OTP	One Time Programmable				
PCB	Printed Circuit Board				
PCS	Physical Coding Sublayer				
PHY	Physical Layer				
PLL	Phase Lock Loop				
RESERVED	Refers to a reserved bit field or address. Unless otherwise noted, reserved bits must always be zero for write operations. Unless otherwise noted, values are not guaranteed when reading reserved bits. Unless otherwise noted, do not read or write to reserved addresses.				
SDK	Software Development Kit				
SMBus	System Management Bus				
UUID	Universally Unique IDentifier				
WORD	16 bits

## 2.0 INTRODUCTION

## 2.1 General Description

The Microchip USB5742 hub is low-power, OEM configurable, USB 3.1 Gen 1 hub feature controller with 2 downstream ports and advanced features for embedded USB applications. The USB5742 is fully compliant with the *Universal Serial Bus Revision 3.1 Specification* and *USB 2.0 Link Power Management Addendum*. The USB5742 supports 5 Gbps SuperSpeed (SS), 480 Mbps Hi-Speed (HS), 12 Mbps Full-Speed (FS), and 1.5 Mbps Low-Speed (LS) USB downstream devices on all enabled downstream ports.

The USB5742 supports the legacy USB speeds (HS/FS/LS) through a dedicated USB 2.0 hub feature controller that is the culmination of five generations of Microchip hub feature controller design and experience with proven reliability, interoperability, and device compatibility. The SuperSpeed hub feature controller operates in parallel with the USB 2.0 controller, decoupling the 5 Gbps SS data transfers from bottlenecks due to the slower USB 2.0 traffic.

The USB5742 supports downstream battery charging. The USB5742 integrated battery charger detection circuitry supports the USB-IF Battery Charging (BC1.2) detection method and most Apple devices. The USB5742 provides the battery charging handshake and supports the following USB-IF BC1.2 charging profiles:

- · DCP: Dedicated Charging Port (Power brick with no data)
- CDP: Charging Downstream Port (1.5A with data)
- SDP: Standard Downstream Port (0.5A with data)
- · Custom profiles loaded via SMBus or OTP

Additionally, the USB5742 includes many powerful and unique features such as:

**PortSwap**, which adds per-port programmability to USB differential-pair pin locations. PortSwap allows direct alignment of USB signals (D+/D-) to connectors to avoid uneven trace length or crossing of the USB differential signals on the PCB.

**PHYBoost**, which provides programmable levels of Hi-Speed USB signal drive strength in the downstream port transceivers. PHYBoost attempts to restore USB signal integrity in a compromised system environment. The graphic on the right shows an example of Hi-Speed USB eye diagrams before and after PHYBoost signal integrity restoration. in a compromised system environment

**VariSense**, which controls the USB receiver sensitivity enabling programmable levels of USB signal receive sensitivity. This capability allows operation in a sub-optimal system environment, such as when a captive USB cable is used.

The USB5742 can be configured for operation through internal default settings. Custom OEM configurations are supported through external SPI ROM or OTP ROM. All port control signal pins are under firmware control in order to allow for maximum operational flexibility, and are available as GPIOs for customer specific use.

The USB5742 is available in a commercial (0°C to +70°C) temperature range. An internal block diagram of the USB5742 is shown in Figure 2-1.

### 3.2 Pin Descriptions

This section contains descriptions of the various USB5742 pins. This pin descriptions have been broken into functional groups as follows:

- USB 3.1 Gen 1 Pin Descriptions
- USB 2.0 Pin Descriptions
- · USB Port Control Pin Descriptions
- SPI/SMBus Pin Descriptions
- · Miscellaneous Pin Descriptions
- · Power and Ground Pin Descriptions

The "\_N" symbol in the signal name indicates that the active, or asserted, state occurs when the signal is at a low voltage level. For example, RESET\_N indicates that the reset signal is active low. When "\_N" is not present after the signal name, the signal is asserted when at the high voltage level.

The terms assertion and negation are used exclusively. This is done to avoid confusion when working with a mixture of "active low" and "Active high" signals. The term assert, or assertion, indicates that a signal is active, independent of whether that level is represented by a high or low voltage. The term negate, or negation, indicates that a signal is inactive.

Note:

The buffer type for each signal is indicated in the "Buffer Type" column of the pin description tables. A description of the buffer types is provided in Section 3.3, "Buffer Types," on page 14. For additional information on configuration straps and configurable pins, refer to Section 3.4, "Configuration Straps and Programmable Functions".

## TABLE 3-2: USB 3.1 GEN 1 PIN DESCRIPTIONS

Num Pins	Symbol	Buffer Type	Description
1	USB3UP_TXDP	IO-U	USB 3.1 Gen 1 upstream SuperSpeed transmit data plus.
1	USB3UP_TXDM	IO-U	USB 3.1 Gen 1 upstream SuperSpeed transmit data minus.
1	USB3UP_RXDP	IO-U	USB 3.1 Gen 1 upstream SuperSpeed receive data plus.
1	USB3UP_RXDM	IO-U	USB 3.1 Gen 1 upstream SuperSpeed receive data minus.
2	USBDN_TXDP[2:1]	IO-U	USB 3.1 Gen 1 downstream ports 2-1 SuperSpeed transmit data plus.
2	USBDN_TXDM[2:1]	IO-U	USB 3.1 Gen 1 downstream ports 2-1 SuperSpeed transmit data minus.
2	USBDN_RXDP[2:1]	IO-U	USB 3.1 Gen 1 downstream ports 2-1 SuperSpeed receive data plus.
2	USBDN_RXDM[2:1]	IO-U	USB 3.1 Gen 1 downstream ports 2-1 SuperSpeed receive data minus.

#### TABLE 3-3: USB 2.0 PIN DESCRIPTIONS

Num Pins	Symbol	Buffer Type	Description
1	USB2UP_DP	IO-U	USB 2.0 upstream data plus (D+).
1	USB2UP_DM	IO-U	USB 2.0 upstream data minus (D-).

TABLE 3-3: USB 2.0 PIN DESCRIPTIONS (CONTINUED)

Num Pins	Symbol	Buffer Type	Description
	USB2DN_DP[2:1]	IO-U	USB 2.0 downstream ports 2-1 data plus (D+).
2	PRT DIS P[2:1]	I	Port 2-1 D+ Disable Configuration Strap.  These configuration straps are used in conjunction with the corresponding PRT DIS M[2:1] straps to disable the related port (2-1). Refer to Section 3.4.2, "Port Disable Configuration (PRT_DIS_P[2:1] / PRT_DIS_M[2:1])" for more information.  See Note 2.
	USB2DN_DM[2:1]	IO-U	USB 2.0 downstream ports 2-1 data minus (D-).
2	PRT DIS M[2:1]	I	Port 2-1 D- Disable Configuration Strap.  These configuration straps are used in conjunction with the corresponding PRT DIS P[2:1] straps to disable the related port (2-1). Refer to Section 3.4.2, "Port Disable Configuration (PRT_DIS_P[2:1] / PRT_DIS_M[2:1])" for more information.  See Note 2.
1	VBUS_DET	IS	This signal detects the state of the upstream bus power. When designing a detachable hub, this pin must be connected to the VBUS power pin of the upstream USB port through a resistor divider (50 k $\Omega$ by 100 k $\Omega$ ) to provide 3.3 V. For self-powered applications with a permanently attached host, this pin must be connected to either 3.3 V or 5.0 V through a resistor divider to provide 3.3 V. In embedded applications, VBUS_DET may be controlled (toggled) when the host desires to renegotiate a connection without requiring a full reset of the device.
	GPIO16	I/O6	General purpose input/output 16.

**Note 2:** Configuration strap values are latched on Power-On Reset (POR) and the rising edge of **RESET\_N** (external chip reset). Configuration straps are identified by an underlined symbol name. Signals that function as configurations traps must be augmented with an external resistor when connected to a load. Refer to Section 3.4, "Configuration Straps and Programmable Functions" for additional information.

TABLE 3-4: USB PORT CONTROL PIN DESCRIPTIONS

Num Pins	Symbol	Buffer Type	Description
1	PRT_CTL1	l (PU)	Port 1 Power Enable / Overcurrent Sense.  As an output, this signal is an active high control signal used to enable power to the downstream port 1. As an input, this signal indicates an overcurrent condition from an external current monitor on USB port 1.
1	PRT_CTL2	I (PU)	Port 2 Power Enable / Overcurrent Sense.  As an output, this signal is an active high control signal used to enable power to the downstream port 2. As an input, this signal indicates an overcurrent condition from an external current monitor on USB port 2.

TABLE 3-5: SPI/SMBUS PIN DESCRIPTIONS

Num Pins	Symbol	Buffer Type	Description
	SPI_CE_N	012	Active low SPI chip enable output.
	GPIO7	I/O12	General purpose input/output 7.
1	CFG NON REM	I	Non-Removable Port Configuration Strap.  This configuration strap is used to configure the number of non-removable ports. Refer to Section 3.4.3, "Non-Removable Port Configuration (CFG_NON_REM)" for more information.  See Note 3.
	SPI_CLK	O6	SPI clock output to the serial ROM, when configured for SPI operation.
1	SMCLK	OD12	SMBus clock pin, when configured for SMBus slave operation.
	GPIO4	I/O6	General purpose input/output 4.
	SPI_DO	O6	SPI data output, when configured for SPI operation.
1	SMDAT	I/O12	SMBus data pin, when configured for SMBus slave operation.
'	GPIO5	1/06	General purpose input/output 5.
	SPI_DI	IS	SPI data input, when configured for SPI operation.
	GPIO9	I/O12	General purpose input/output 9.
1	CFG BC EN	I	Battery Charging Configuration Strap.  This configuration strap is used to enable battery charging. Refer to Section 3.4.4, "Battery Charging Configuration (CFG_BC_EN)" for more information.  See Note 3.

**Note 3:** Configuration strap values are latched on Power-On Reset (POR) and the rising edge of **RESET\_N** (external chip reset). Configuration straps are identified by an underlined symbol name. Signals that function as configurations traps must be augmented with an external resistor when connected to a load. Refer to Section 3.4, "Configuration Straps and Programmable Functions" for additional information.

TABLE 3-6: MISCELLANEOUS PIN DESCRIPTIONS

Num Pins	Symbol	Buffer Type	Description
1	RESET_N	IS	The RESET_N pin puts the device into Reset Mode, as the name of the pin and function then align.
	XTALI	ICLK	External 25 MHz crystal input
1	CLK_IN	ICLK	External reference clock input.  The device may alternatively be driven by a single-ended clock oscillator. When this method is used, XTALO should be left unconnected.
1	XTALO	OCLK	External 25 MHz crystal output
1	RBIAS	Al	A 12.0 k $\Omega$ (+/- 1%) resistor is attached from ground to this pin to set the transceiver's internal bias settings.

TABLE 3-6: MISCELLANEOUS PIN DESCRIPTIONS (CONTINUED)

Num Pins	Symbol	Buffer Type	Description
1	ATEST	AI	Analog test pin.  This signal is used for test purposes and must always be connected to ground.
1	GPIO19	I/O6	General purpose input/output 19.
	GPIO20	I/O6	General purpose input/output 20.
1	GANG PWR	l (PU)	When pulled high enables gang mode. Gang power pin when used in gang mode.
12	NC	-	No Connect. These pins must be left unconnected for proper operation.

## TABLE 3-7: POWER AND GROUND PIN DESCRIPTIONS

Num Pins	Symbol	Buffer Type	Description
4	VDD33	Р	+3.3 V power and internal regulator input  Refer to Section 4.1, "Power Connections" for power connection information.
8	VDD12	Р	+1.2 V core power  Refer to Section 4.1, "Power Connections" for power connection information.
Pad	VSS	Р	Common ground.  This exposed pad must be connected to the ground plane with a via array.

## 3.3 Buffer Types

**TABLE 3-8: BUFFER TYPES** 

Buffer Type	Description
I	Input
IS	Schmitt-triggered input
O6	Output with 6 mA sink and 6 mA source
O12	Output with 12 mA sink and 12 mA source
OD12	Open-drain output with 12 mA sink
PU	50 μA (typical) internal pull-up. Unless otherwise noted in the pin description, internal pull-ups are always enabled.  Internal pull-up resistors prevent unconnected inputs from floating. Do not rely on internal resistors to drive signals external to the device. When connected to a load that must be pulled high, an external resistor must be added.
PD	50 μA (typical) internal pull-down. Unless otherwise noted in the pin description, internal pull-downs are always enabled. Internal pull-down resistors prevent unconnected inputs from floating. Do not rely on internal resistors to drive signals external to the device. When connected to a load that must be pulled low, an external resistor must be added.
IO-U	Analog input/output as defined in USB specification
Al	Analog input
ICLK	Crystal oscillator input pin
OCLK	Crystal oscillator output pin
Р	Power pin

**Note:** Refer to Section 9.5, "DC Specifications" for individual buffer DC electrical characteristics.

## 3.4 Configuration Straps and Programmable Functions

Configuration straps are multi-function pins that are used during Power-On Reset (POR) or external chip reset (RESET\_N) to determine the default configuration of a particular feature. The state of the signal is latched following deassertion of the reset. Configuration straps are identified by an underlined symbol name. This section details the various device configuration straps and associated programmable pin functions.

Note:

The system designer must guarantee that configuration straps meet the timing requirements specified in Section 9.6.1, "Power-On and Configuration Strap Timing," on page 33 and Section 9.6.2, "Reset and Configuration Strap Timing," on page 33. If configuration straps are not at the correct voltage level prior to being latched, the device may capture incorrect strap values.

#### 3.4.1 SPI/SMBUS CONFIGURATION

The SPI/SMBus pins can be configured into one of two functional modes:

- · SPI Mode
- · SMBus Slave Mode

If 10 k $\Omega$  pull-up resistors are detected on SPI\_DO and SPI\_CLK, the SPI/SMBus pins are configured into SMBus Slave Mode. If no pull-ups or pull-downs are detected on SPI\_DO and SPI\_CLK, the SPI/SMBus pins are first configured into SPI Mode. The strap settings for these supported modes are detailed in Table 3-9. The individual pin function assignments for each mode are detailed in Table 3-10. For additional device connection information, refer to Section 4.0, "Device Connections".

TABLE 3-9: SPI/SMBUS MODE CONFIGURATION SETTINGS

Pin	SPI Mode (Note 4)	SMBus Slave Mode	
39 ( <b>SPI_DO</b> )	No pull-up/down	10 kΩ pull-up	
38 (SPI_CLK)	No pull-up/down	10 kΩ pull-up	

Note 4: In order to use the SPI interface, an SPI ROM containing a valid signature of 2DFU (device firmware upgrade) beginning at address 0xFFFA must be present. Refer to Section 7.1, "SPI Master Interface" for additional information.

TABLE 3-10: SPI/SMBUS MODE PIN ASSIGNMENTS

Pin	SPI Mode	SMBus Slave Mode	
41	SPI_CE_N	CFG NON REM	
40	SPI_DI	<u>CFG BC EN</u>	
39	SPI_DO	SMDAT	
38	SPI_CLK	SMCLK	

#### 3.4.2 PORT DISABLE CONFIGURATION (PRT DIS P[2:1] / PRT DIS M[2:1])

The PRT\_DIS\_P[2:1] and PRT\_DIS\_M[2:1] configuration straps are used in conjunction to disable the related port (2-1).

For **PRT DIS** Px (where x is the corresponding port 2-1):

 $\mathbf{0}$  = Port x D+ Enabled

1 = Port x D + Disabled

For <u>PRT DIS Mx</u> (where x is the corresponding port 2-1):

 $\mathbf{0}$  = Port x D- Enabled

1 = Port x D- Disabled

Note: Both <u>PRT DIS Px</u> and <u>PRT DIS Mx</u> (where x is the corresponding port) must be tied to 3.3 V to disable the associated downstream port. Disabling the USB 2.0 port will also disable the corresponding USB 3.1 Gen 1 port.

#### 3.4.3 NON-REMOVABLE PORT CONFIGURATION (CFG NON REM)

The <u>CFG NON REM</u> configuration strap is used to configure the non-removable port settings of the device to one of three settings. These modes are selected by the configuration of an external resistor on the <u>CFG NON REM</u> pin. The resistor options are a 200 k $\Omega$  pull-down, 200 k $\Omega$  pull-up, and 10 k $\Omega$  pull-down, as shown in Table 3-11.

TABLE 3-11: CFG\_NON\_REM RESISTOR ENCODING

<u>CFG NON REM</u> Resistor Value	Setting
200 kΩ Pull-Down	All ports removable
200 kΩ Pull-Up	Port 1 non-removable
10 kΩ Pull-Down	Port 1, 2 non-removable

## 3.4.4 BATTERY CHARGING CONFIGURATION (CFG BC EN)

The <u>CFG BC EN</u> configuration strap is used to configure the battery charging port settings of the device to one of three settings. These modes are selected by the configuration of an external resistor on the <u>CFG BC EN</u> pin. The resistor options are a 200 k $\Omega$  pull-down, 200 k $\Omega$  pull-up, and 10 k $\Omega$  pull-down, as shown in Table 3-12.

TABLE 3-12: CFG BC EN RESISTOR ENCODING

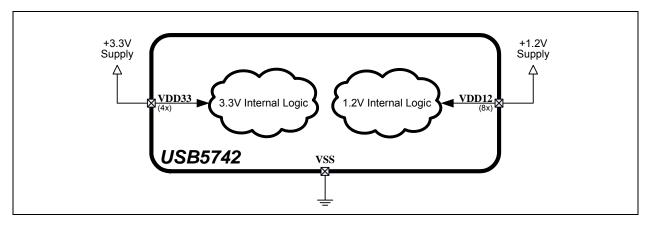

CFG BC EN Resistor Value	Setting
200 kΩ Pull-Down	No battery charging
200 kΩ Pull-Up	Port 1 battery charging
10 kΩ Pull-Down	Port 1, 2 battery charging

## 4.0 DEVICE CONNECTIONS

## 4.1 Power Connections

Figure 4-1 illustrates the device power connections.

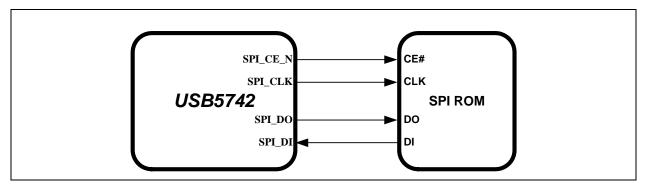

FIGURE 4-1: POWER CONNECTIONS

## 4.2 SPI ROM Connections

Figure 4-2 illustrates the device SPI ROM connections. Refer to Section 7.1, "SPI Master Interface," on page 23 for additional information on this device interface.

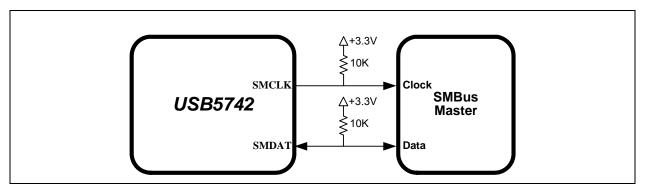

FIGURE 4-2: SPI ROM CONNECTIONS

## 4.3 SMBus Slave Connections

Figure 4-3 illustrates the device SMBus slave connections. Refer to Section 7.2, "SMBus Slave Interface," on page 23 for additional information on this device interface.

FIGURE 4-3: SMBUS SLAVE CONNECTIONS

## 5.0 MODES OF OPERATION

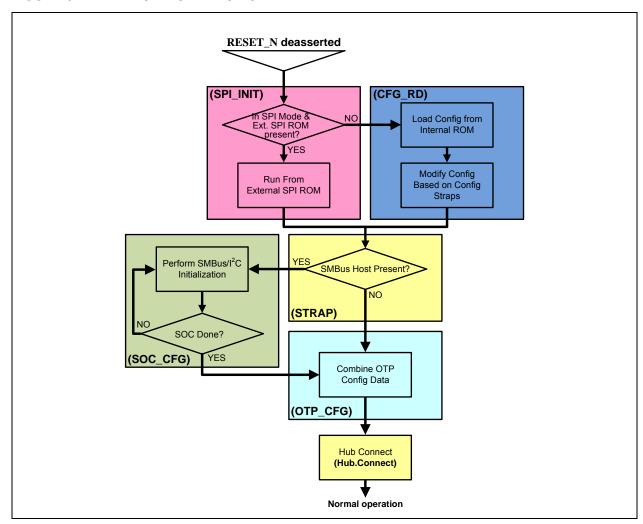

The device provides two main modes of operation: Standby Mode and Hub Mode. These modes are controlled via the **RESET\_N** pin, as shown in Table 5-1.

TABLE 5-1: MODES OF OPERATION

RESET_N Input	Summary
0	<b>Standby Mode</b> : This is the lowest power mode of the device. No functions are active other than monitoring the <b>RESET_N</b> input. All port interfaces are high impedance and the PLL is halted. Refer to Section 8.2.2, "External Chip Reset (RESET_N)" for additional information on <b>RESET_N</b> .
1	<b>Hub (Normal) Mode</b> : The device operates as a configurable USB hub with battery charger detection. This mode has various sub-modes of operation, as detailed in Figure 5-1. Power consumption is based on the number of active ports, their speed, and amount of data received.

The flowchart in Figure 5-1 details the modes of operation and details how the device traverses through the Hub Mode stages (shown in bold). The remaining sub-sections provide more detail on each stage of operation.

FIGURE 5-1: HUB MODE FLOWCHART

### 5.1 Boot Sequence

#### 5.1.1 STANDBY MODE

If the RESET\_N pin is asserted, the hub will be in Standby Mode. This mode provides a very low power state for maximum power efficiency when no signaling is required. This is the lowest power state. In Standby Mode all downstream ports are disabled, the USB data pins are held in a high-impedance state, all transactions immediately terminate (no states saved), all internal registers return to their default state, the PLL is halted, and core logic is powered down in order to minimize power consumption. Because core logic is powered off, no configuration settings are retained in this mode and must be re-initialized after RESET\_N is negated high.

## 5.1.2 SPI INITIALIZATION STAGE (SPI\_INIT)

The first stage, the initialization stage, occurs on the deassertion of **RESET\_N**. In this stage, the internal logic is reset, the PLL locks if a valid clock is supplied, and the configuration registers are initialized to their default state. The internal firmware then checks for an external SPI ROM. The firmware looks for an external SPI flash device that contains a valid signature of "2DFU" (device firmware upgrade) beginning at address 0xFFFA. If a valid signature is found, then the external ROM is enabled and the code execution begins at address 0x0000 in the external SPI device. If a valid signature is not found, then execution continues from internal ROM (CFG RD stage).

When using an external SPI ROM, a 1 Mbit, 60 MHz or faster ROM must be used. Both 1- and 2-bit SPI operation are supported. For optimum throughput, a 2-bit SPI ROM is recommended. Both mode 0 and mode 3 SPI ROMs are also supported.

If the system is not strapped for SPI Mode, code execution will continue from internal ROM (CFG\_RD stage).

## 5.1.3 CONFIGURATION READ STAGE (CFG\_RD)

In this stage, the internal firmware loads the default values from the internal ROM and then uses the configuration strapping options to override the default values. Refer to Section 3.4, "Configuration Straps and Programmable Functions" for information on usage of the various device configuration straps.

#### 5.1.4 STRAP READ STAGE (STRAP)

In this stage, the firmware registers the configuration strap settings on the SPI\_DO and SPI\_CLK pins. Refer to Section 3.4.1, "SPI/SMBus Configuration" for information on configuring these straps. If configured for SMBus Slave Mode, the next state will be SOC CFG. Otherwise, the next state is OTP CFG.

## 5.1.5 SOC CONFIGURATION STAGE (SOC\_CFG)

In this stage, the SOC can modify any of the default configuration settings specified in the integrated ROM, such as USB device descriptors and port electrical settings.

There is no time limit on this mode. In this stage the firmware will wait indefinitely for the SMBus/l<sup>2</sup>C configuration. When the SOC has completed configuring the device, it must write to register 0xFF to end the configuration.

#### 5.1.6 OTP CONFIGURATION STAGE (OTP\_CFG)

Once the SOC has indicated that it is done with configuration, all configuration data is combined in this stage. The default data, the SOC configuration data, and the OTP data are all combined in the firmware and the device is programmed.

After the device is fully configured, it will go idle and then into suspend if there is no VBUS or Hub.Connect present. Once VBUS is present, and battery charging is enabled, the device will transition to the Battery Charger Detection Stage. If VBUS is present, and battery charging is not enabled, the device will transition to the Connect stage.

### 5.1.7 HUB CONNECT STAGE (HUB.CONNECT)

Once the CHGDET stage is completed, the device enters the Hub Connect stage. USB connect can be initiated by asserting the VBUS pin function high. The device will remain in the Hub Connect stage indefinitely until the VBUS pin function is deasserted.

## 5.1.8 NORMAL MODE

Lastly, the hub enters Normal Mode of operation. In this stage full USB operation is supported under control of the USB Host on the upstream port. The device will remain in the normal mode until the operating mode is changed by the system.

If **RESET\_N** is asserted low, then Standby Mode is entered. The device may then be placed into any of the designated hub stages. Asserting a soft disconnect on the upstream port will cause the hub to return to the Hub.Connect stage until the soft disconnect is negated.

## 6.0 DEVICE CONFIGURATION

The device supports a large number of features (some mutually exclusive), and must be configured in order to correctly function when attached to a USB host controller. The hub can be configured either internally or externally depending on the implemented interface.

Microchip provides a comprehensive software programming tool, Pro-Touch, for configuring the USB5742 functions, registers and OTP memory. All configuration is to be performed via the Pro-Touch programming tool. For additional information on the Pro-Touch programming tool, refer to the Software Libraries within the Microchip USB5742 product page at www.microchip.com/USB5742.

**Note:** Device configuration straps and programmable pins are detailed in Section 3.4, "Configuration Straps and Programmable Functions," on page 15.

Refer to Section 7.0, "Device Interfaces" for detailed information on each device interface.

#### 6.1 Customer Accessible Functions

The following USB or SMBus accessible functions are available to the customer via the Pro-Touch Programming Tool.

Note: For additional programming details, refer to the Pro-Touch programming tool.

## 6.1.1 USB ACCESSIBLE FUNCTIONS

#### 6.1.1.1 OTP Access over USB

The OTP ROM in the device is accessible via the USB bus. All OTP parameters can be modified to the USB Host. The OTP operates in Single Ended mode. For more information, refer to the Microchip USB5742 product page and SDK at www.microchip.com/USB5742

### 6.1.1.2 Battery Charging Access over USB

The Battery charging behavior of the device can be dynamically changed by the USB Host when something other than the preprogrammed or OTP programmed behavior is desired. For more information, refer to the Microchip USB5742 product page and SDK at www.microchip.com/USB5742

## 6.1.2 SMBUS ACCESSIBLE FUNCTIONS

OTP access and configuration of specific device functions are possible via the USB5742 SMBus. All OTP parameters can be modified via the SMBus Host. The OTP can be programmed to operate in Single-Ended, Differential, Redundant, or Differential Redundant mode, depending on the level of reliability required. For more information, refer to AN1903 - "Configuration Options for the USB5734 and USB5744" application note at www.microchip.com/AN1903.

## 7.0 DEVICE INTERFACES

The USB5742 provides multiple interfaces for configuration and external memory access. This section details the various device interfaces and their usage:

- · SPI Master Interface
- SMBus Slave Interface

Note: For details on how to enable each interface, refer to Section 3.4.1, "SPI/SMBus Configuration".

For information on device connections, refer to Section 4.0, "Device Connections". For information on device configuration, refer to Section 6.0, "Device Configuration".

Microchip provides a comprehensive software programming tool, Pro-Touch, for configuring the USB5742 functions, registers and OTP memory. All configuration is to be performed via the Pro-Touch programming tool. For additional information on the Pro-Touch programming tool, refer to Software Libraries within Microchip USB5742 product page at www.microchip.com/USB5742.

#### 7.1 SPI Master Interface

The device is capable of code execution from an external SPI ROM. When configured for SPI Mode, on power up the firmware looks for an external SPI flash device that contains a valid signature of 2DFU (device firmware upgrade) beginning at address 0xFFFA. If a valid signature is found, then the external ROM is enabled and the code execution begins at address 0x0000 in the external SPI device. If a valid signature is not found, then execution continues from internal ROM.

Note: For SPI timing information, refer to Section 9.6.6, "SPI Timing".

## 7.2 SMBus Slave Interface

The device includes an integrated SMBus slave interface, which can be used to access internal device run time registers or program the internal OTP memory. SMBus slave detection is accomplished by detection of pull-up resistors on both the SMDAT and SMCLK signals. Refer to Section 3.4.1, "SPI/SMBus Configuration" for additional information.

**Note:** All device configuration must be performed via the Pro-Touch Programming Tool. For additional information on the Pro-Touch programming tool, refer to Software Libraries within Microchip USB5742 product page at www.microchip.com/USB5742.

## 8.0 FUNCTIONAL DESCRIPTIONS

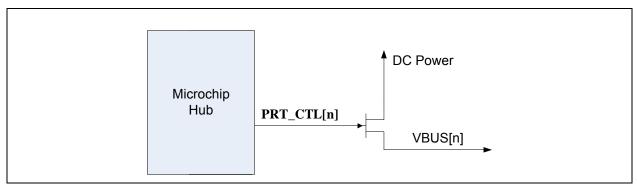

This section details various USB5742 functions, including:

- · Downstream Battery Charging
- Resets
- Link Power Management (LPM)
- · Port Control Interface

## 8.1 Downstream Battery Charging

The device can be configured by an OEM to have any of the downstream ports support battery charging. The hub's role in battery charging is to provide acknowledgment to a device's query as to whether the hub system supports USB battery charging. The hub silicon does not provide any current or power FETs or any additional circuitry to actually charge the device. Those components must be provided externally by the OEM.

FIGURE 8-1: BATTERY CHARGING EXTERNAL POWER SUPPLY

If the OEM provides an external supply capable of supplying current per the battery charging specification, the hub can be configured to indicate the presence of such a supply from the device. This indication, via the PRT\_CTL[2:1] pins, is on a per port basis. For example, the OEM can configure two ports to support battery charging through high current power FETs and leave the other two ports as standard USB ports.

For additional information, refer to the Microchip USB5742 Battery Charging application note on the Microchip.com USB5742 product page at www.microchip.com/USB5742.

#### 8.2 Resets

The device includes the following chip-level reset sources:

- Power-On Reset (POR)
- · External Chip Reset (RESET N)
- USB Bus Reset

#### 8.2.1 POWER-ON RESET (POR)

A power-on reset occurs whenever power is initially supplied to the device, or if power is removed and reapplied to the device. A timer within the device will assert the internal reset per the specifications listed in Section 9.6.1, "Power-On and Configuration Strap Timing," on page 33.

### 8.2.2 EXTERNAL CHIP RESET (RESET\_N)

A valid hardware reset is defined as assertion of **RESET\_N**, after all power supplies are within operating range, per the specifications in Section 9.6.2, "Reset and Configuration Strap Timing," on page 33. While reset is asserted, the device (and its associated external circuitry) enters Standby Mode and consumes minimal current.

Assertion of **RESET N** causes the following:

- 1. The PHY is disabled and the differential pairs will be in a high-impedance state.
- 2. All transactions immediately terminate; no states are saved.
- 3. All internal registers return to the default state.
- 4. The external crystal oscillator is halted.
- 5. The PLL is halted.

**Note:** All power supplies must have reached the operating levels mandated in Section 9.2, "Operating Conditions\*\*," on page 29, prior to (or coincident with) the assertion of **RESET\_N**.

#### 8.2.3 USB BUS RESET

In response to the upstream port signaling a reset to the device, the device performs the following:

**Note:** The device does not propagate the upstream USB reset to downstream devices.

- 1. Sets default address to 0.
- 2. Sets configuration to Unconfigured.
- 3. Moves device from suspended to active (if suspended).
- 4. Complies with the USB Specification for behavior after completion of a reset sequence.

The host then configures the device in accordance with the USB Specification.

## 8.3 Link Power Management (LPM)

The device supports the L0 (On), L1 (Sleep), and L2 (Suspend) link power management states. These supported LPM states offer low transitional latencies in the tens of microseconds versus the much longer latencies of the traditional USB suspend/resume in the tens of milliseconds. The supported LPM states are detailed in Table 8-1.

TABLE 8-1: LPM STATE DEFINITIONS

State	Description	Entry/Exit Time to L0
L2	Suspend	Entry: ~3 ms Exit: ~2 ms (from start of RESUME)
L1	Sleep	Entry: <10 us Exit: <50 us
LO	Fully Enabled (On)	-

#### 8.4 Port Control Interface

Port power and over-current sense share the same pin (PRT\_CTLx) for each port. These functions can be controlled directly from the USB hub, or via the processor.

The device can be configured into the following port control modes:

- · Ganged Mode
- · Combined Mode

Port connection in various modes are detailed in the following subsections.

#### 8.4.1 PORT CONNECTION IN GANGED MODE

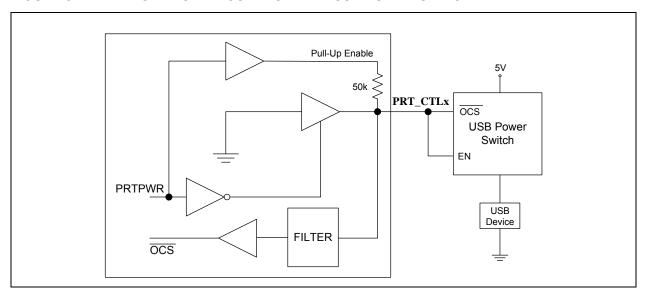

In this mode, one pin (GANG\_PWR) is used to control port power and over-current sensing.

#### 8.4.2 PORT CONNECTION IN COMBINED MODE

#### 8.4.2.1 Port Power Control using USB Power Switch

When operating in combined mode, the device will have one port power control and over-current sense pin for each downstream port. When disabling port power, the driver will actively drive a '0'. To avoid unnecessary power dissipation, the pull-up resistor will be disabled at that time. When port power is enabled, it will disable the output driver and enable the pull-up resistor, making it an open drain output. If there is an over-current situation, the USB Power Switch will assert the open drain OCS signal. The Schmidt trigger input will recognize that as a low. The open drain output does not interfere. The over-current sense filter handles the transient conditions such as low voltage while the device is powering up.

FIGURE 8-2: PORT POWER CONTROL WITH USB POWER SWITCH

## 8.4.2.2 Port Power Control using Poly Fuse

When using the device with a poly fuse, there is no need for an output power control. To maintain consistency, the same circuit will be used. A single port power control and over-current sense for each downstream port is still used from the Hub's perspective. When disabling port power, the driver will actively drive a '0'. This will have no effect as the external diode will isolate pin from the load. When port power is enabled, it will disable the output driver and enable the pull-up resistor. This means that the pull-up resistor is providing 3.3 volts to the anode of the diode. If there is an over-current situation, the poly fuse will open. This will cause the cathode of the diode to go to 0 volts. The anode of the diode will be at 0.7 volts, and the Schmidt trigger input will register this as a low resulting in an over-current detection. The open drain output does not interfere.

**Note:** The USB 2.0 and USB 3.1 Gen 1 bPwrOn2PwrGood descriptors must be set to 0 when using poly-fuse mode. Refer to Microchip application note AN1903 "Configuration Options for the USB5734 and USB5744" for details on how to change these values.

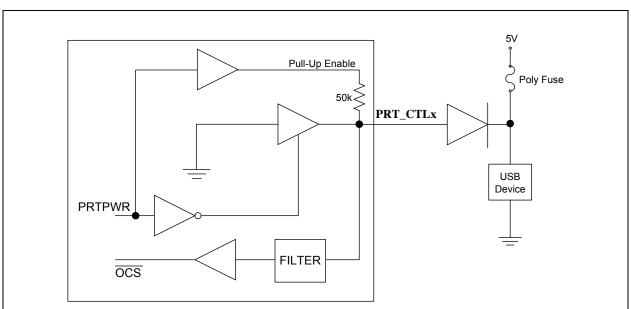

FIGURE 8-3: PORT POWER CONTROL USING A POLY FUSE

## 8.4.2.3 Port Power Control with Single Poly Fuse and Multiple Loads

Many customers use a single poly fuse to power all their devices. For the ganged situation, all power control pins must be tied together.

FIGURE 8-4: PORT POWER CONTROL WITH GANGED CONTROL WITH POLY FUSE

## 8.4.3 PORT CONTROLLER CONNECTION EXAMPLE

## FIGURE 8-5: USB5742 WITH 2 GENERIC PORT POWER CONTROLLERS (1 BC ENABLED)

Note: The <u>CFG BC EN</u> configuration strap must be properly configured to enable battery charging on the appropriate ports. For example, in the application shown in Figure 8-5, <u>CFG BC EN</u> must be connected to an external 200 kΩ pull-up resistor to enable battery charging on Port 1 only. For more information on the <u>CFG BC EN</u> configuration strap, refer to Section 3.4.4, "Battery Charging Configuration (CFG\_BC\_EN)".

## 9.0 OPERATIONAL CHARACTERISTICS

## 9.1 Absolute Maximum Ratings\*

+3.3 V Supply Voltage (VDD33) (Note 1)
Positive voltage on input signal pins, with respect to ground (Note 2) +4.6 V
Negative voltage on input signal pins, with respect to ground
Positive voltage on XTALI/CLK_IN, with respect to ground
Positive voltage on USB DP/DM signal pins, with respect to ground
Positive voltage on USB 3.1 Gen 1 USB3UP_xxxx and USB3DN_xxxx signal pins, with respect to ground 1.32 V
Storage Temperature55°C to +150°C
Junction Temperature
Lead Temperature Range
HBM ESD Performance

**Note 1:** When powering this device from laboratory or system power supplies, it is important that the absolute maximum ratings not be exceeded or device failure can result. Some power supplies exhibit voltage spikes on their outputs when AC power is switched on or off. In addition, voltage transients on the AC power line may appear on the DC output. If this possibility exists, it is suggested to use a clamp circuit.

Note 2: This rating does not apply to the following pins: All USB DM/DP pins, XTAL1/CLK IN, and XTALO

## 9.2 Operating Conditions\*\*

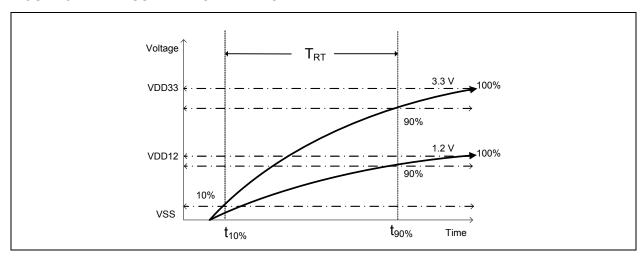

+1.2 V Supply Voltage (VDD12)	+1.08 V to +1.32 V
+3.3 V Supply Voltage (VDD33)	+3.0 V to +3.6 V
Input Signal Pins Voltage (Note 2)	0.3 V to +3.6 V
XTALI/CLK_IN Voltage	0.3 V to +3.6 V
USB 2.0 DP/DM Signal Pins Voltage	0.3 V to +5.5 V
USB 3.1 Gen 1 USB3UP_xxxx and USB3DN_xxxx Signal Pins Voltage	0.3 V to +1.32 V
Ambient Operating Temperature in Still Air (T <sub>A</sub> )	Note 3
+1.2 V Supply Voltage Rise Time (T <sub>RT</sub> in Figure 9-1)	400 μs
+3.3 V Supply Voltage Rise Time (T <sub>RT</sub> in Figure 9-1)	400 μs
<b>Note 3:</b> 0°C to +70°C for commercial version, -40°C to +85°C for industrial version.	

<sup>\*\*</sup>Proper operation of the device is guaranteed only within the ranges specified in this section.

Note: Do not drive input signals without power supplied to the device.

<sup>\*</sup>Stresses exceeding those listed in this section could cause permanent damage to the device. This is a stress rating only. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at any condition exceeding those indicated in Section 9.2, "Operating Conditions\*\*", Section 9.5, "DC Specifications", or any other applicable section of this specification is not implied.

FIGURE 9-1: SUPPLY RISE TIME MODEL

High Input Level	$V_{IH}$	0.85		VDD33	V	
IO-U Type Buffer (See Note 5)						Note 5

Note 4: XTALI can optionally be driven from a 25 MHz singled-ended clock oscillator.

Note 5: Refer to the USB 3.1 Gen 1 Specification for USB DC electrical characteristics.

## 9.6 AC Specifications

This section details the various AC timing specifications of the device.

#### 9.6.1 POWER-ON AND CONFIGURATION STRAP TIMING

Figure 9-2 illustrates the configuration strap valid timing requirements in relation to power-on, for applications where **RESET\_N** is not used at power-on. In order for valid configuration strap values to be read at power-on, the following timing requirements must be met. The operational levels (V<sub>opp</sub>) for the external power supplies are detailed in Section 9.2, "Operating Conditions\*\*," on page 29.

#### FIGURE 9-2: POWER-ON CONFIGURATION STRAP VALID TIMING

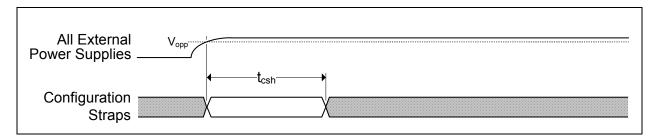

TABLE 9-5: POWER-ON CONFIGURATION STRAP LATCHING TIMING

Symbol	ymbol Description		Тур	Max	Units
t <sub>csh</sub>	Configuration strap hold after external power supplies at operational levels	1			ms

Device configuration straps are also latched as a result of **RESET\_N** assertion. Refer to Section 9.6.2, "Reset and Configuration Strap Timing" for additional details.

### 9.6.2 RESET AND CONFIGURATION STRAP TIMING

Figure 9-3 illustrates the **RESET\_N** pin timing requirements and its relation to the configuration strap pins. Assertion of **RESET\_N** is not a requirement. However, if used, it must be asserted for the minimum period specified. Refer to Section 8.2, "Resets" for additional information on resets. Refer to Section 3.4, "Configuration Straps and Programmable Functions" for additional information on configuration straps.

## FIGURE 9-3: RESET\_N CONFIGURATION STRAP TIMING

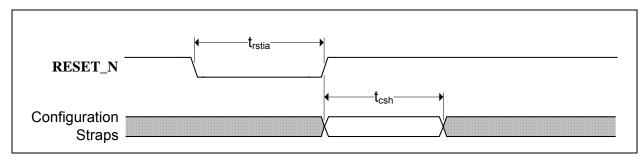

TABLE 9-6: RESET\_N CONFIGURATION STRAP TIMING

Symbol	Description		Тур	Max	Units
t <sub>rstia</sub>	RESET_N input assertion time	5			μS
t <sub>csh</sub>	Configuration strap pins hold after RESET_N deassertion	1			ms

**Note:** The clock input must be stable prior to **RESET\_N** deassertion.

Configuration strap latching and output drive timings shown assume that the Power-On reset has finished first otherwise the timings in Section 9.6.1, "Power-On and Configuration Strap Timing" apply.

#### 9.6.3 USB TIMING

All device USB signals confirm to the voltage, power, and timing characteristics/specifications as set forth in the *Universal Serial Bus Specification*. Please refer to the *Universal Serial Bus Revision 3.1 Specification*, available at http://www.usb.org/developers/docs.

## 9.6.4 I<sup>2</sup>C TIMING

All device  $I^2C$  signals confirm to the 100KHz Standard Mode (Sm) voltage, power, and timing characteristics/specifications as set forth in the  $\ell^2C$ -Bus Specification. Please refer to the  $\ell^2C$ -Bus Specification, available at http://www.nxp.com/documents/user\_manual/UM10204.pdf.

#### 9.6.5 SMBUS TIMING

All device SMBus signals confirm to the voltage, power, and timing characteristics/specifications as set forth in the System Management Bus Specification. Please refer to the System Management Bus Specification, Version 1.0, available at http://smbus.org/specs.

## 9.6.6 SPI TIMING

This section specifies the SPI timing requirements for the device.

FIGURE 9-4: SPI TIMING

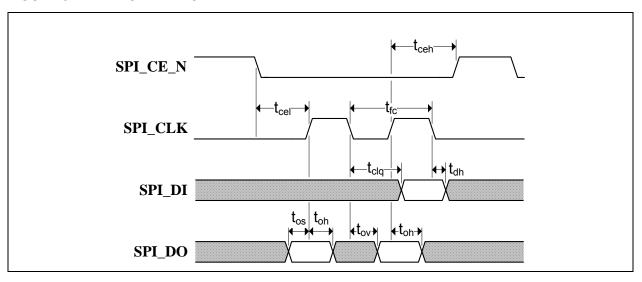

TABLE 9-7: SPI TIMING (30 MHZ OPERATION)

Symbol	Description	Min	Тур	Max	Units
t <sub>fc</sub>	Clock frequency			30	MHz
t <sub>ceh</sub>	Chip enable (SPI_CE_EN) high time	100			ns
t <sub>clq</sub>	Clock to input data			13	ns
t <sub>dh</sub>	Input data hold time	0			ns
t <sub>os</sub>	Output setup time	5			ns
t <sub>oh</sub>	Output hold time	5			ns
t <sub>ov</sub>	Clock to output valid	4			ns
t <sub>cel</sub>	Chip enable (SPI_CE_EN) low to first clock	12			ns
t <sub>ceh</sub>	Last clock to chip enable (SPI_CE_EN) high	12			ns

TABLE 9-8: SPI TIMING (60 MHZ OPERATION)

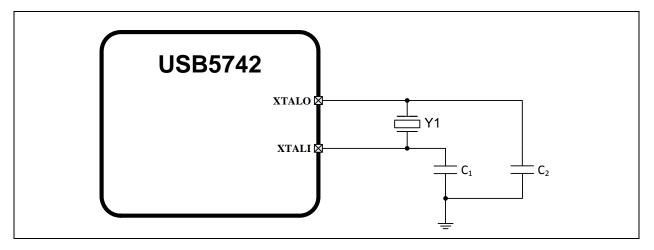

Symbol	Description	Min	Тур	Max	Units
t <sub>fc</sub>	Clock frequency			60	MHz
t <sub>ceh</sub>	Chip enable (SPI_CE_EN) high time	50			ns
t <sub>clq</sub>	Clock to input data			9	ns
t <sub>dh</sub>	Input data hold time	0			ns
tos	Output setup time	5			ns
t <sub>oh</sub>	Output hold time	5			ns
t <sub>ov</sub>	Clock to output valid	4			ns
t <sub>cel</sub>	Chip enable (SPI_CE_EN) low to first clock	12			ns
t <sub>ceh</sub>	Last clock to chip enable (SPI_CE_EN) high	12			ns

## 9.7 Clock Specifications

The device can accept either a 25MHz crystal or a 25MHz single-ended clock oscillator (±50ppm) input. If the single-ended clock oscillator method is implemented, **XTALO** should be left unconnected and **XTALI/CLK\_IN** should be driven with a nominal 0-3.3V clock signal. The input clock duty cycle is 40% minimum, 50% typical and 60% maximum.

It is recommended that a crystal utilizing matching parallel load capacitors be used for the crystal input/output signals (XTALI/XTALO). The following circuit design (Figure 9-5) and specifications (Table 9-9) are required to ensure proper operation.

FIGURE 9-5: 25MHZ CRYSTAL CIRCUIT

## 9.7.1 CRYSTAL SPECIFICATIONS

It is recommended that a crystal utilizing matching parallel load capacitors be used for the crystal input/output signals (XTALI/XTALO). Refer to Table 9-9 for the recommended crystal specifications.

TABLE 9-9: CRYSTAL SPECIFICATIONS

PARAMETER	SYMBOL	MIN	NOM	MAX	UNITS	NOTES	
Crystal Cut	AT, typ						
Crystal Oscillation Mode		Fundamental Mode					
Crystal Calibration Mode		Paralle	el Resonant Mo	ode			
Frequency	$F_{fund}$	-	25.000	-	MHz		
Frequency Tolerance @ 25°C	F <sub>tol</sub>	-	-	±50	PPM	Note 6	
Frequency Stability Over Temp	F <sub>temp</sub>	-	-	±50	PPM	Note 6	
Frequency Deviation Over Time	F <sub>age</sub>	-	±3 to 5	-	PPM		
Total Allowable PPM Budget		-	-	±100	PPM	Note 7	
Shunt Capacitance	C <sub>O</sub>	-	7 typ	-	pF		
Load Capacitance	$C_L$	-	20 typ	-	pF		
Drive Level	$P_{W}$	100	-	-	uW		
Equivalent Series Resistance	R <sub>1</sub>	-	-	50	Ω		
Operating Temperature Range		Note 7	-	Note 8	°C		
XTALI/CLK_IN Pin Capacitance		-	3 typ	-	pF	Note 9	
XTALO Pin Capacitance		1	3 typ	-	pF	Note 9	

Note 6: Frequency Deviation Over Time is also referred to as Aging.

- Note 7: 0 °C for commercial version, -40 °C for industrial version.
- Note 8: +70 °C for commercial version, +85 °C for industrial version.
- **Note 9:** This number includes the pad, the bond wire and the lead frame. PCB capacitance is not included in this value. The **XTALI/CLK\_IN** pin, **XTALO** pin and PCB capacitance values are required to accurately calculate the value of the two external load capacitors. These two external load capacitors determine the accuracy of the 25.000 MHz frequency.

## 9.7.2 EXTERNAL REFERENCE CLOCK (CLK\_IN)

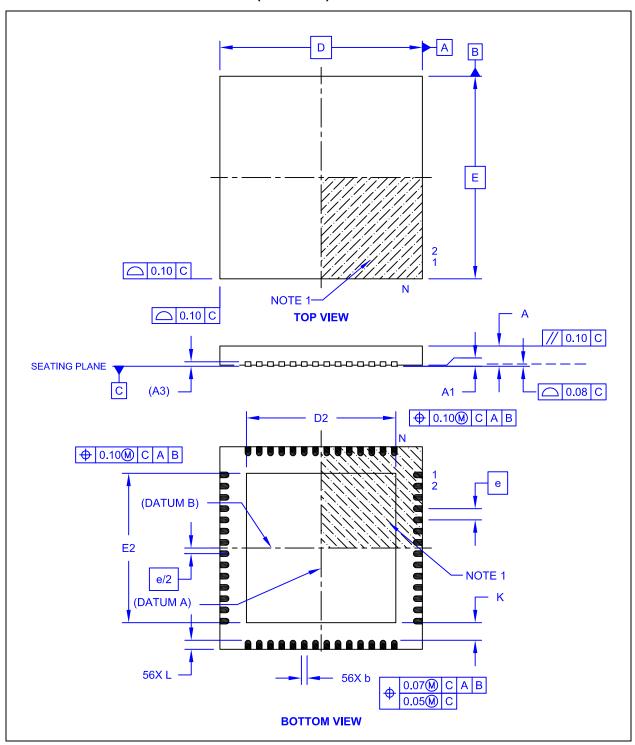

When using an external reference clock, the following input clock specifications are suggested:

- 25 MHz
- 50% duty cycle ±10%, ±100 ppm
- Jitter < 100 ps RMS

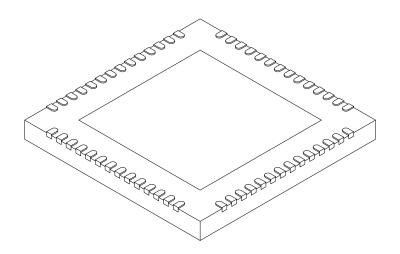

## 10.0 PACKAGE OUTLINES

**Note:** For the most current package drawings, see the Microchip Packaging Specification at: http://www.microchip.com/packaging.

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at <a href="www.microchip.com">www.microchip.com</a>. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- Product Support Data sheets and errata, application notes and sample programs, design resources, user's
  guides and hardware support documents, latest software releases and archived software
- General Technical Support Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- Business of Microchip Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

#### CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## **CUSTOMER SUPPORT**

Users of Microchip products can receive assistance through several channels:

- · Distributor or Representative
- · Local Sales Office
- · Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://www.microchip.com/support

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO. [X] [-X] / XX  T T  Device Tape & Reel Temperature Package Option Range		Examples:  a) USB5742/2G     Tray, Commercial temp., 56-pin SQFN  b) USB5742T/2G				
Device:	USB5742	D)	Tape & reel, Commercial temp., 56-pin SQFN			
Tape and Reel Option:	Blank = Standard packaging (tray) T = Tape and Reel <sup>(Note 1)</sup>					
Temperature Range:	Blank = 0°C to +70°C (Commercial)					
Package:	2G = 56-pin SQFN	Note	1:	Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.		

#### Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- · Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not
  mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

#### **Trademarks**

The Microchip name and logo, the Microchip logo, dsPIC, FlashFlex, flexPWR, JukeBlox, KEELOQ, KEELOQ logo, Kleer, LANCheck, MediaLB, MOST, MOST logo, MPLAB, OptoLyzer, PIC, PICSTART, PIC<sup>32</sup> logo, RightTouch, SpyNIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

The Embedded Control Solutions Company and mTouch are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, BodyCom, chipKIT, chipKIT logo, CodeGuard, dsPICDEM, dsPICDEM.net, ECAN, In-Circuit Serial Programming, ICSP, Inter-Chip Connectivity, KleerNet, KleerNet logo, MiWi, motorBench, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, RightTouch logo, REAL ICE, SQI, Serial Quad I/O, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
= ISO/TS 16949=

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
