

Z8051 Series 8-Bit Microcontrollers

Z51F3221

Product Specification

PS030002-0212

PRELIMINARY

Warning: DO NOT USE THIS PRODUCT IN LIFE SUPPORT SYSTEMS.

LIFE SUPPORT POLICY

ZILOG'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF ZILOG CORPORATION.

As used herein

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.

Z51F3221

CMOS SINGLE-CHIP 8-BIT MICROCONTROLLER WITH 12-BIT A/D CONVERTER

1. Overview

1.1 Description

The Z51F3221 MCU is advanced CMOS 8-bit microcontroller with 32k bytes of Flash. This is powerful microcontroller which provides a highly flexible and cost effective solution to many embedded control applications. This provides the following features : 32k bytes of Flash, 256 bytes of IRAM, 1k bytes of XRAM , general purpose I/O, basic interval timer, watchdog timer, 8/16-bit timer/counter, carrier generation, 8/16-bit PWM output, watch timer, buzzer driving port, SIO, UART, 12-bit A/D converter, LCD driver, on-chip POR, LVR, LVI, on-chip oscillator and clock circuitry. The Z51F3221 MCU also supports power saving modes to reduce power consumption.

Device Name	Flash	XRAM	IRAM	ADC	I/O PORT	Package
Z51F3221	32KB	1KB	256 bytes	8 channel	70	80-pin LQFP
				5 channel	54	64-pin LQFP

1.2 Features

- **CPU**
 - 8 Bit CISC Core (8051 Compatible)
- **ROM (Flash) Capacity**
 - 32k Bytes
 - Flash with self read/write capability
 - On chip debug and In-system programming (ISP)
 - Endurance : 100,000 times
- **256 Bytes IRAM**
- **1k Bytes XRAM**
 - (40 Bytes including LCD display RAM)
- **General Purpose I/O (GPIO)**
 - Normal I/O : 24 Ports
(P0, P1[6:0], P2, P92)
 - LCD shared I/O : 46 Ports
(P3[6:1], P4, P5, P6, P7, P8)
- **Basic Interval Timer (BIT)**
 - 8Bit × 1ch
- **Watch Dog Timer (WDT)**
 - 8Bit × 1ch
 - 6kHz internal RC oscillator
- **Timer/ Counter**
 - 8Bit × 2ch (T0/T1), 16Bit × 2ch (T2/T3)
- **Carrier Generation**
 - Carrier Generation (by T1), T2 Clock source
- **PWM**
 - 8Bit × 1ch (by T0), 16Bit × 1ch (by T3)
- **Watch Timer (WT)**
 - 3.91mS/0.25S/0.5S/1S/1M interval at 32.768kHz
- **Buzzer**
 - 8Bit × 1ch
- **SIO**
 - 8Bit × 1ch
- **UART**
 - 8Bit × 1ch
- **12 Bit A/D Converter**
 - 8 Input channels
- **LCD Driver**
 - 34 Segments and 8 Common terminals
 - Internal or external resistor bias
 - 2, 3, 4, 5, 6 and 8 common selectable
 - Bias selectable (1/2, 1/3, 1/4)
- **Power On Reset**
 - Reset release level (1.4V)
- **Low Voltage Reset**
 - 14 level detect (1.60V/ 2.00V/ 2.10V/ 2.20V/
2.32V/ 2.44V/ 2.59V/ 2.75V/ 2.93V/ 3.14V/
3.38V/ 3.67V/ 4.00V/ 4.40V)
- **Low Voltage Indicator**
 - 13 level detect (2.00V/ 2.10V/ 2.20V/ 2.32V/
2.44V/ 2.59V/ 2.75V/ 2.93V/ 3.14V/ 3.38V/
3.67V/ 4.00V/ 4.40V)
 - External reference detect
- **Interrupt Sources**
 - External Interrupts
(EXINT0~7, EINT10, EINT13) (10)
 - Timer(0/1/2/3) (6)
 - WDT (1)
 - BIT (1)
 - WT (1)
 - SIO (1)
 - UART(TX/RX) (2)
 - ADC (1)
- **Internal RC Oscillator**
 - Internal RC frequency: 8MHz ± 10%
(T_A= -40°C ~ +85°C)
- **Power Down Mode**
 - STOP, IDLE mode
- **Operating Voltage and Frequency**
 - 1.8V ~ 5.5V (@1.0 ~ 4.2MHz)
 - 2.7V ~ 5.5V (@1.0 ~ 10.0MHz)
 - 3.0V ~ 5.5V (@1.0 ~ 12.0MHz)
- **Minimum Instruction Execution Time**
 - 167nS (@ 12MHz main clock)
 - 61μS (@t 32.768kHz sub clock)
- **Operating Temperature:** - 40 ~ + 85 °C
- **Oscillator Type**
 - 1.0-12MHz Crystal or Ceramic for main clock
 - 32.768kHz Crystal for sub clock
- **Package Type**
 - 80 LQFP-1212
 - 64 LQFP-1010

1.3 Ordering Information

Table 1-1 Ordering Information for the Z51F3221 MCU

Device Name	ROM Size	IRAM Size	XRAM Size	Package
Z51F3221ATX	32KB Flash	256 bytes	1k bytes	80-pin LQFP
Z51F3221ARX				64-pin LQFP

1.3.1 Part Number Suffix Designation

Zilog part numbers consist of a number of components, as indicated in the following example.

Example: Part number Z51F3221ARX is an 8-bit MCU with 32 KB of Flash memory and 1.25 KB of RAM in a 64-pin LQFP package and operating within a -40°C to $+85^{\circ}\text{C}$ temperature range. In accordance with RoHS standards, this device has been built using lead-free solder.

1.4 Development Tools

1.4.1 Compiler

We do not provide the compiler. Please contact the third parties.

The core of the Z51F3221 MCU is Mentor 8051. And, device ROM size is smaller than 64k bytes. Developer can use all kinds of third party's standard 8051 compiler.

1.4.2 OCD emulator and debugger

The OCD (On Chip Debug) emulator supports Zilog's 8051 series MCU emulation.

The OCD interface uses two-wire interfacing between PC and MCU which is attached to user's system. The OCD can read or change the value of MCU internal memory and I/O peripherals. And the OCD also controls MCU internal debugging logic, it means OCD controls emulation, step run, monitoring, etc.

The OCD Debugger program works on Microsoft-Windows NT, 2000, XP, Vista (32bit) operating system.

If you want to see more details, please refer to OCD debugger manual. You can download debugger S/W and manual from our web-site.

Connection:

- SCLK (Z51F3221 P10 port)
- SDATA (Z51F3221 P11 port)

1.4.3 Programmer

Single programmer:

PGMplus USB: It programs MCU device directly.

StandAlone PGMplus: It programs MCU device directly.

OCD emulator: It can write code in MCU device too, because OCD debugging supports ISP (In System Programming).

It does not require additional H/W, except developer's target system.

Gang programmer:

It programs 8 MCU devices at once.

So, it is mainly used in mass production line.

Gang programmer is standalone type, it means it does not require host PC, after a program is downloaded from host PC to Gang programmer.

Figure 1.1 StandAlone Gang8 (for Mass Production)

2. Block Diagram

Figure 2.1 Block Diagram

NOTE) 1. The P06–P07, P13, P25–P27, P70–P71, P75–P77, and P80–P84 are only in the 80-pin package.
2. The P06–P07, P13, P25–P27, P70–P71, P75–P77, and P80–P84 should be selected as push-pull or open-drain output by software control when the 64-pin package is used.

3. Pin Assignment

Figure 3.1 Z51F3221 80LQFP-1212 Pin Assignment

NOTE) On On-Chip Debugging, ISP uses P1[1:0] pin as DSDA, DSCL.

Figure 3.2 Z51F3221 64LQFP-1010 Pin Assignment

- NOTES)
1. The P06–P07, P13, P25–P27, P70–P71, P75–P77 and P80–P84 are only in the 80-pin package.
 2. The P06–P07, P13, P25–P27, P70–P71, P75–P77 and P80–P84 should be selected as push-pull or open-drain output by software control when the 64-pin package is used.
 3. On On-Chip Debugging, ISP uses P1[1:0] pin as DSDA, DSCL.

5. Pin Description

Table 5-1 Normal pin description

PIN Name	I/O	Function	@RESET	Shared with
P00	I/O	Port 0 is a bit-programmable I/O port which can be configured as a schmitt-trigger input, a push-pull output, or an open-drain output. A pull-up resistor can be specified in 1-bit unit. The P06 – P07 are only in the 80-pin package.	Input	EINT0
P01				EINT1
P02				EINT2
P03				EINT3
P04				EINT4
P05				EINT5/EC3/BUZO
P06			Output	EINT6
P07				EINT7
P10	I/O	Port 1 is a bit-programmable I/O port which can be configured as a schmitt-trigger input, a push-pull output, or an open-drain output. A pull-up resistor can be specified in 1-bit unit. The P13 is only in the 80-pin package	Input	DSCL
P11				DSDA
P12				EINT13/PWM30/T30
P13			Output	EC3/BUZO
P14			Input	SO
P15				SCK
P16				SI
P20	I/O	Port 2 is a bit-programmable I/O port which can be configured as an input, a push-pull output, or an open-drain output. A pull-up resistor can be specified in 1-bit unit. The P25 – P27 are only in the 80-pin package.	Input	AN0
P21				AN1
P22				AN2
P23			Output	AN3
P24				AN4
P25				AN5
P26				AN6
P27				AN7/LVIREF
P31	I/O	Port 3 is a bit-programmable I/O port which can be configured as an input, a push-pull output, or an open-drain output. A pull-up resistor can be specified in 1-bit unit.	Input	VLC0
P32				VLC1
P33				VLC2
P34				VLC3
P35				COM0
P36				COM1
P40	I/O	Port 4 is a bit-programmable I/O port which can be configured as an input, a push-pull output, or an open-drain output. A pull-up resistor can be specified in 1-bit unit.	Input	COM2/SEG0
P41				COM3/SEG1
P42				COM4/SEG2
P43				COM5/SEG3
P44				COM6/SEG4
P45				COM7/SEG5
P46				SEG6
P47				SEG7

Table 5-1 Normal pin description (Continued)

PIN Name	I/O	Function	@RESET	Shared with
P50	I/O	Port 5 is a bit-programmable I/O port which can be configured as an input, a push-pull output, or an open-drain output. A pull-up resistor can be specified in 1-bit unit.	Input	SEG8
P51				SEG9
P52				SEG10
P53				SEG11
P54				SEG12
P55				SEG13
P56				SEG14
P57				SEG15
P60	I/O	Port 6 is a bit-programmable I/O port which can be configured as an input, a push-pull output, or an open-drain output. A pull-up resistor can be specified in 1-bit unit.	Input	SEG16
P61				SEG17
P62				SEG18
P63				SEG19
P64				SEG20
P65				SEG21
P66				SEG22
P67				SEG23
P70	I/O	Port 7 is a bit-programmable I/O port which can be configured as an input (P75: schmitt-trigger input), a push-pull output, or an open-drain output. A pull-up resistor can be specified in 1-bit unit. The P70 – P71 and P75 – P77 are only in the 80-pin package.	Input	SEG24
P71				SEG25
P72				SEG26/REM
P73				SEG27/T00/PWM00
P74				SEG28/EC0
P75				SEG29/EINT10/ACK
P76				SEG30/TXD
P77				SEG31/RXD
P80	I/O	Port 8 is a bit-programmable I/O port which can be configured as an input (P85: schmitt-trigger input), a push-pull output, or an open-drain output. A pull-up resistor can be specified in 1-bit unit The P80 – P84 are only in the 80-pin package.	Output	SEG32
P81				SEG33
P82				SEG34/REM
P83				SEG35/T00/PWM00
P84				SEG36/EC0
P85				SEG37/EIINT10/ACK
P86				SEG38/TXD
P87				SEG39/RXD
P92	I/O	Port 9 is a bit-programmable I/O port which can be configured as an input, a push-pull output, or an open-drain output. A pull-up resistor can be specified in 1-bit unit	Input	–

Table 5-1 Normal pin description (Continued)

PIN Name	I/O	Function	@RESET	Shared with
EINT10	I/O	External interrupt input and Timer 0 capture input	Output	P85/SEG37/ACK
			Input	P75/SEG29/ACK
EINT13	I/O	External interrupt input and Timer 3 capture input	Input	P12/PWM30/T3O
EINT0	I/O	External interrupt inputs	Input	P00
EINT1				P01
EINT2				P02
EINT3				P03
EINT4				P04
EINT5				P05/EC3/BUZO
EINT6			Output	P06

SEG37				P85/EINT10/ACK
SEG38				P86/TXD
SEG39				P87/RXD
AN0–AN3	I/O	A/D converter analog input channels	Input	P20–P23
AN4–AN6			Output	P24–P26
AN7				P27/LVIREF
RESET	I	System reset pin	–	–
DATA	I/O	On chip debugger data input/output ^(NOTE1, 2)	Input	P11
DACL	I/O	On chip debugger clock input ^(NOTE1, 2)	Input	P10
XIN, XOUT	–	Main oscillator pins	–	–
SXIN, SXOUT	–	Sub oscillator pins	–	–
VREG	–	Regulator voltage output for sub clock 0.1µF capacitor needed	–	–
AVREF	–	A/D converter reference voltage	–	–
AVSS	–	A/D converter ground	–	–
VDD, VSS	–	Power input pins	–	–

- NOTES) 1. If the P10/DACL and P11/DSDA pins are connected to an emulator during reset or power-on reset, the pins are automatically configured as the debugger pins.
2. The P10/DACL and P11/DSDA pins are configured as inputs with internal pull-up resistor only during the reset or power-on reset.
3. The P06–P07, P13, P25–P27, P70–P71, P75–P77 and P80–P84 are only in the 80-pin package.
4. The P06–P07, P13, P25–P27, P70–P71, P75–P77 and P80–P84 should be selected as push-pull or open-drain output by software control when the 64-pin package is used.

Figure 6.1 General Purpose I/O Port

6.2 External Interrupt I/O Port

Figure 6.2 External Interrupt I/O Port

7. Electrical Characteristics

7.1 Absolute Maximum Ratings

Table 7-1 Absolute Maximum Ratings

Parameter	Symbol	Rating	Unit	Note
Supply Voltage	VDD	-0.3 ~ +6.0	V	—
Normal Voltage Pin	V _I	-0.3 ~ VDD+0.3	V	Voltage on any pin with respect to VSS
	V _O	-0.3 ~ VDD+0.3	V	
	I _{OH}	-10	mA	Maximum current output sourced by (I _{OH} per I/O pin)
	ΣI _{OH}	-80	mA	Maximum current (ΣI _{OH})
	I _{OL}	60	mA	Maximum current sunk by (I _{OL} per I/O pin)
	ΣI _{OL}	120	mA	Maximum current (ΣI _{OL})
Total Power Dissipation	P _T	600	mW	—
Storage Temperature	T _{STG}	-65 ~ +150	°C	—

NOTE) Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

7.2 Recommended Operating Conditions

Table 7-2 Recommended Operating Conditions

(T_A = -40°C ~ +85°C)

Parameter	Symbol	Conditions		MIN	TYP	MAX	Unit
Supply Voltage	VDD	f _X = 32 ~ 35kHz	SX-tal	1.8	—	5.5	V
		f _X = 1.0 ~ 4.2MHz	X-tal, Internal RC	1.8	—	5.5	
		f _X = 1.0 ~ 10.0MHz		2.7	—	5.5	
		f _X = 1.0 ~ 12.0MHz		3.0	—	5.5	
Operating Temperature	T _{OPR}	VDD= 1.8 ~ 5.5V		-40	—	85	°C

7.3 A/D Converter Characteristics

Table 7-3 A/D Converter Characteristics

(T_A = -40°C ~ +85°C, VDD = 1.8V ~ 5.5V, VSS = 0V)

Parameter	Symbol	Conditions	MIN	TYP	MAX	Unit
Resolution		—	—	12	—	bit
Integral Linear Error	ILE	AVREF = 2.7V ~ 5.5V f _x = 8MHz	—	—	±2	LSB
Differential Linearity Error	DLE		—	—	±1	
Zero Offset Error	ZOE		—	—	±3	
Full Scale Error	FSE		—	—	±3	
Conversion Time	t _{CON}	12bit resolution, 8MHz	20	—	—	μs
Analog Input Voltage	V _{AN}	—	AVSS	—	AVREF	V
Analog Reference Voltage	AVREF	—	1.8	—	VDD	
Analog Ground Voltage	AVSS	—	VSS	—	VSS+0.3	
Analog Input Leakage Current	I _{AN}	AVREF = 5.12V	—	—	10	μA
ADC Operating Current	I _{ADC}	Enable	—	1	2	mA
		Disable	—	—	0.1	μA

NOTES) 1. Zero offset error is the difference between 000000000 and the converted output for zero input voltage (VSS).

2. Full scale error is the difference between 111111111 and the converted output for full-scale input voltage (AVREF).

7.4 Power-On Reset Characteristics

Table 7-4 Power-On Reset Characteristics

(T_A = -40°C ~ +85°C, VDD = 1.8V ~ 5.5V, VSS = 0V)

Parameter	Symbol	Conditions	MIN	TYP	MAX	Unit
RESET Release Level	V _{POR}	—	—	1.4	—	V
VDD Voltage Rising Time	t _R	—	0.05	—	—	V/ms
POR Current	I _{POR}	—	—	0.2	—	μA

7.5 Low Voltage Reset and Low Voltage Indicator Characteristics

Table 7-5 LVR and LVI Characteristics

(T_A = -40°C ~ +85°C, VDD = 1.8V ~ 5.5V)

Parameter	Symbol	Conditions		MIN	TYP	MAX	Unit
Detection Level	V _{LVR} V _{LVI}	The LVR can select all levels but LVI can select other levels except 1.60V.		–	1.60	1.75	V
				1.85	2.00	2.15	
				1.95	2.10	2.25	
				2.05	2.20	2.35	
				2.17	2.32	2.47	
				2.29	2.44	2.59	
				2.39	2.59	2.79	
				2.55	2.75	2.95	
				2.73	2.93	3.13	
				2.94	3.14	3.34	
				3.18	3.38	3.58	
				3.37	3.67	3.97	
				3.70	4.00	4.30	
				4.10	4.40	4.70	
Hysteresis	△V	–		–	10	100	mV
Minimum Pulse Width	t _{LW}	–		100	–	–	μS
LVR and LVI Current	I _{BL}	Enable (Both)	VDD= 3V	–	6.5	13.0	μA
		Enable (One of two)		–	5.0	10.0	
		Disable (Both)		–	–	0.1	

7.6 Internal RC Oscillator Characteristics

Table 7-6 Internal RC Oscillator Characteristics

(T_A = -40°C ~ +85°C, VDD = 1.8V ~ 5.5V)

Parameter	Symbol	Conditions	MIN	TYP	MAX	Unit
Frequency	f _{IRC}	T _A = 25°C	–	8.0	–	MHz
Tolerance	–	T _A = -40°C to +85°C	-10	–	+10	%
Clock Duty Ratio	TOD	–	40	50	60	%
Stabilization Time	t _{WDTS}	T _A = 25°C	–	–	100	μs
IRC Current	I _{IRC}	Enable	–	0.5	–	mA
		Disable	–	–	0.1	μA

7.7 Internal Watch-Dog Timer RC Oscillator Characteristics

Table 7-7 Internal WDTRC Oscillator Characteristics

(T_A = -40°C ~ +85°C, VDD = 1.8V ~ 5.5V, VSS = 0V)

Parameter	Symbol	Conditions	MIN	TYP	MAX	Unit
Frequency	f _{WDTRC}	–	3	6	9	kHz
Stabilization Time	t _{WDTS}	–	–	–	1	ms
WDTRC Current	I _{WDTRC}	Enable	–	1	–	μA
		Disable	–	–	0.1	

7.8 DC Characteristics

Table 7-8 DC Characteristics

($T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$, $V_{DD} = 1.8\text{V} \sim 5.5\text{V}$, $V_{SS} = 0\text{V}$, $f_{XIN} = 12\text{MHz}$)

Parameter	Symbol	Conditions		MIN	TYP	MAX	Unit
Input High Voltage	V _{IH1}	P0x, P1x, P75, P85, RESETB		0.8VDD	—	VDD	V
	V _{IH2}	All input pins except V _{IH1}		0.7VDD	—	VDD	V
Input Low Voltage	V _{IL1}	P0x, P1x, P75, P85, RESETB		—	—	0.2VDD	V
	V _{IL2}	All input pins except V _{IL1}		—	—	0.3VDD	V
Output High Voltage	V _{OH1}	All output ports; I _{OH} = -2mA, VDD= 4.5V		VDD-1.0	—	—	V
Output Low Voltage	V _{OL1}	P1x, P2x; I _{OL} = 15mA, VDD= 4.5V		—	—	1.0	
	V _{OL2}	All output ports except V _{OL1} ; I _{OL} = 10mA, VDD=4.5V		—	—	1.0	V
Input High Leakage Current	I _{IH}	All input ports		—	—	1	μA
Input Low Leakage Current	I _{IL}	All input ports		-1	—	—	μA
Pull-Up Resistor	R _{PU1}	VI=0V, TA= 25°C All Input ports	VDD=5.0V	25	50	100	kΩ
			VDD=3.0V	50	100	200	
	R _{PU2}	VI=0V, TA= 25°C RESETB	VDD=5.0V	150	250	400	kΩ
			VDD=3.0V	300	500	700	
OSC feedback resistor	R _{X1}	XIN= VDD, XOUT= VSS TA= 25°C, VDD= 5V		600	1200	2000	kΩ
	R _{X2}	SXIN=VDD, SXOUT=VSS TA= 25 °C ,VDD=5V		1750	3500	7000	
LCD Voltage Dividing Resistor	R _{LCD}	TA= 25 °C		25	50	80	kΩ
Common Driver Voltage Drop	V _{DC}	VDD= 2.7V to 5.5V, VLCD-COMi , (i=0-7) -15uA per common pin		—	—	120	mV
Segment Driver Voltage Drop	V _{DS}	VDD= 2.7V to 5.5V, VLCD-SEGx , (x=0-39) -15uA per common pin		—	—	120	mV
Middle Output Voltage (NOTE)	V _{LC1}	VDD= 2.7V to 5.5V, 1/4 bias LCD clock= 0Hz, VLC0=VDD		0.75VDD-0.2	0.75VDD	0.75VDD+0.2	V
	0.50VDD-0.2			0.5VDD	0.50VDD+0.2		
	V _{LC3}			0.25VDD-0.2	0.25VDD	0.25VDD+0.2	

NOTE) It is middle output voltage when the VDD and the V_{LC0} node are connected.

Table 7-8 DC Characteristics (Continued)

($T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$, $V_{DD} = 1.8\text{V} \sim 5.5\text{V}$, $V_{SS} = 0\text{V}$, $f_{XIN} = 12\text{MHz}$)

Parameter	Symbol	Condition		MIN	TYP	MAX	Unit
Supply Current	I_{DD1} (RUN)	$f_{XIN} = 12\text{MHz}$, $V_{DD} = 5\text{V} \pm 10\%$		–	3.0	6.0	mA
		$f_{XIN} = 10\text{MHz}$, $V_{DD} = 3\text{V} \pm 10\%$		–	2.2	4.4	
		$f_{XIN} = 4.2\text{MHz}$, $V_{DD} = 3\text{V} \pm 10\%$		–	1.6	3.2	
	I_{DD2} (IDLE)	$f_{XIN} = 12\text{MHz}$, $V_{DD} = 5\text{V} \pm 10\%$		–	2.0	4.0	mA
		$f_{XIN} = 10\text{MHz}$, $V_{DD} = 3\text{V} \pm 10\%$		–	1.3	2.6	
		$f_{XIN} = 4.2\text{MHz}$, $V_{DD} = 3\text{V} \pm 10\%$		–	0.7	1.4	
	I_{DD3}	$f_{XIN} = 32.768\text{kHz}$ $V_{DD} = 3\text{V} \pm 10\%$	Sub RUN	–	50.0	80.0	μA
	I_{DD4}	$T_A = 25^{\circ}\text{C}$, $\text{PSAVE} = 1$	Sub IDLE	–	4.0	8.0	μA
	I_{DD5}	STOP, $V_{DD} = 5\text{V} \pm 10\%$, $T_A = 25^{\circ}\text{C}$		–	0.5	3.0	μA

NOTES) 1. Where the f_{XIN} is an external main oscillator, f_{SUB} is an external sub oscillator, the f_{IRC} is an internal RC oscillator, and the f_x is the selected system clock.

2. All supply current items don't include the current of an internal Watch-dog timer RC (WDTRC) oscillator and a peripheral block.

3. All supply current items include the current of the power-on reset (POR) block.

7.9 Serial I/O Characteristics

Table 7-9 Serial I/O Characteristics

(T_A = -40°C ~ +85°C, VDD = 1.8V ~ 5.5V)

Parameter	Symbol	Conditions	MIN	TYP	MAX	Unit
SCK cycle time	t _{KCY}	External SCK source	1,000	—	—	nS
		Internal SCK source	1,000			
SCK high, low width	t _{KH} , t _{KL}	External SCK source	500			nS
		Internal SCK source	t _{KCY} /2-50			
SI setup time to SCK high	t _{SIK}	External SCK source	250			nS
		Internal SCK source	250			
SI hold time to SCK high	t _{SI}	External SCK source	400			nS
		Internal SCK source	400			
Output delay for SCK to SO	t _{KSO}	External SCK source	—	—	300	nS
		Internal SCK source			250	
Interrupt input high, low width	t _{INTH} , t _{INTL}	All interrupt, VDD = 5V	200	—	—	nS
RESETB input low width	t _{RSL}	Input, VDD = 5V	10	—	—	μS

Figure 7.1 Input Timing for External Interrupts

7.11 Data Retention Voltage in Stop Mode

Table 7-11 Data Retention Voltage in Stop ModeR

($T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$, $V_{DD} = 1.8\text{V} \sim 5.5\text{V}$)

Parameter	Symbol	Conditions	MIN	TYP	MAX	Unit
Data retention supply voltage	V_{DDDR}	—	1.8	—	5.5	V
Data retention supply current	I_{DDDR}	$V_{DDR} = 1.8\text{V}$, ($T_A = 25^{\circ}\text{C}$), Stop mode	—	—	1	μA

NOTE: tWAIT is the same as (the selected bit overflow of BIT) X 1/(BIT Clock)

Figure 7.6 Stop Mode Release Timing when Initiated by an Interrupt

NOTE : tWAIT is the same as $(4096 \times 4 \times 1/f_x)$ (16.4ms @ 1MHz)

Figure 7.7 Stop Mode Release Timing when Initiated by RESETB

7.12 Internal Flash Rom Characteristics

Table 7-12 Internal Flash Rom Characteristics

(T_A= -40°C ~ +85°C, VDD= 1.8V ~ 5.5V, VSS= 0V)

Parameter	Symbol	Condition	MIN	TYP	MAX	Unit
Sector Write Time	t _{FSW}	—	—	2.5	2.7	mS
Sector Erase Time	t _{FSE}	—	—	2.5	2.7	
Hard-Lock Time	t _{FHL}	—	—	2.5	2.7	
Page Buffer Reset Time	t _{FBR}	—	—	—	5	μS
Flash Programming Frequency	f _{PGM}	—	1	—	—	MHz
Endurance of Write/Erase	N _{FWE}	—	—	—	100,000	Times

NOTE) During a flash operation, SCLK[1:0] of SCCR must be set to “00” or “01” (INT-RC OSC or Main X-TAL for system clock).

7.13 Input/Output Capacitance

Table 7-13 Input/Output Capacitance

(T_A= -40°C ~ +85°C, VDD= 0V)

Parameter	Symbol	Condition	MIN	TYP	MAX	Unit
Input Capacitance	C _{IN}	f _x = 1MHz Unmeasured pins are connected to VSS	—	—	10	pF
Output Capacitance	C _{OUT}					
I/O Capacitance	C _{IO}					

7.14 Main Clock Oscillator Characteristics

Table 7-14 Main Clock Oscillator Characteristics

(T_A = -40°C ~ +85°C, VDD = 1.8V ~ 5.5V)

Oscillator	Parameter	Condition	MIN	TYP	MAX	Unit
Crystal	Main oscillation frequency	1.8V – 5.5V	1.0	–	4.2	MHz
		2.7V – 5.5V	1.0	–	10.0	
		3.0V – 5.5V	1.0	–	12.0	
Ceramic Oscillator	Main oscillation frequency	1.8V – 5.5V	1.0	–	4.2	MHz
		2.7V – 5.5V	1.0	–	10.0	
		3.0V – 5.5V	1.0	–	12.0	
External Clock	XIN input frequency	1.8V – 5.5V	1.0	–	4.2	MHz
		2.7V – 5.5V	1.0	–	10.0	
		3.0V – 5.5V	1.0	–	12.0	

Figure 7.8 Crystal/Ceramic Oscillator

Figure 7.9 External Clock

7.15 Sub Clock Oscillator Characteristics

Table 7-15 Sub Clock Oscillator Characteristics

($T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$, $V_{DD} = 1.8\text{V} \sim 5.5\text{V}$)

Oscillator	Parameter	Condition	MIN	TYP	MAX	Unit
Crystal	Sub oscillation frequency	1.8V – 5.5V	32	32.768	35	kHz
External Clock	SXIN input frequency		32	–	100	kHz

Figure 7.10 Crystal Oscillator

Figure 7.11 External Clock

7.16 Main Oscillation Stabilization Characteristics

Table 7-16 Main Oscillation Stabilization Characteristics

($T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$, $V_{DD} = 1.8\text{V} \sim 5.5\text{V}$)

Oscillator	Parameter	MIN	TYP	MAX	Unit
Crystal	$f_x > 1\text{MHz}$ Oscillation stabilization occurs when V_{DD} is equal to the minimum oscillator voltage range.	–	–	60	mS
Ceramic		–	–	10	mS
External Clock	$f_{XIN} = 1 \text{ to } 12\text{MHz}$ XIN input high and low width (t_{XH} , t_{XL})	42	–	500	nS

Figure 7.12 Clock Timing Measurement at XIN

7.17 Sub Oscillation Characteristics

Table 7-17 Sub Oscillation Stabilization Characteristics

($T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$, $V_{DD} = 1.8\text{V} \sim 5.5\text{V}$)

Oscillator	Parameter	MIN	TYP	MAX	Unit
Crystal	–	–	–	10	S
External Clock	SXIN input high and low width (t_{XH} , t_{XL})	5	–	15	μS

7.20 Typical Characteristics

These graphs and tables provided in this section are only for design guidance and are not tested or guaranteed. In graphs or tables some data are out of specified operating range (e.g. out of specified VDD range). This is only for information and devices are guaranteed to operate properly only within the specified range.

The data presented in this section is a statistical summary of data collected on units from different lots over a period of time. "Typical" represents the mean of the distribution while "max" or "min" represents (mean + 3 σ) and (mean - 3 σ) respectively where σ is standard deviation.

8. Memory

The Z51F3221 MCU addresses two separate address memory stores: Program memory and Data memory. The logical separation of Program and Data memory allows Data memory to be accessed by 8-bit addresses, which makes the 8-bit CPU access the data memory more rapidly. Nevertheless, 16-bit Data memory addresses can also be generated through the DPTR register.

The Z51F3221 MCU provides on-chip 32k bytes of the ISP type flash program memory, which can be read and written to. Internal data memory (IRAM) is 256 bytes and it includes the stack area. External data memory (XRAM) is 1k bytes and it includes 40 bytes of LCD display RAM.

8.1 Program Memory

A 16-bit program counter is capable of addressing up to 64k bytes, but this device has just 32k bytes program memory space.

Figure 8-1 shows the map of the lower part of the program memory. After reset, the CPU begins execution from location 0000H. Each interrupt is assigned a fixed location in program memory. The interrupt causes the CPU to jump to that location, where it commences execution of the service routine. External interrupt 10, for example, is assigned to location 000BH. If external interrupt 10 is going to be used, its service routine must begin at location 000BH. If the interrupt is not going to be used, its service location is available as general purpose program memory. If an interrupt service routine is short enough (as is often the case in control applications), it can reside entirely within that 8 byte interval. Longer service routines can use a jump instruction to skip over subsequent interrupt locations, if other interrupts are in use.

Figure 8.1 Program Memory

- 32k Bytes Including Interrupt Vector Region

8.2 Data Memory

Figure 8-2 shows the internal data memory space available.

Figure 8.2 Data Memory Map

The internal data memory space is divided into three blocks, which are generally referred to as the lower 128 bytes, upper 128 bytes, and SFR space.

Internal data memory addresses are always one byte wide, which implies an address space of only 256 bytes. However, in fact the addressing modes for internal RAM can accommodate up to 384 bytes by using a simple trick. Direct addresses higher than 7FH access one memory space and indirect addresses higher than 7FH access a different memory space. Thus Figure 8-2 shows the upper 128 bytes and SFR space occupying the same block of addresses, 80H through FFH, although they are physically separate entities.

The lower 128 bytes of RAM are present in all 8051 devices as mapped in Figure 8-3. The lowest 32 bytes are grouped into 4 banks of 8 registers. Program instructions call out these registers as R0 through R7. Two bits in the Program Status Word select which register bank is in use. This allows more efficient use of code space, since register instructions are shorter than instructions that use direct addressing.

The next 16 bytes above the register banks form a block of bit-addressable memory space. The 8051 instruction set includes a wide selection of single-bit instructions, and the 128 bits in this area can be directly addressed by these instructions. The bit addresses in this area are 00H through 7FH.

All of the bytes in the lower 128 bytes can be accessed by either direct or indirect addressing. The upper 128 bytes RAM can only be accessed by indirect addressing. These spaces are used for data RAM and stack.

Figure 8.3 Lower 128 Bytes RAM

8.3 XRAM Memory

The Z51F3221 MCU features 1k bytes XRAM. This area has no relation with RAM/Flash. It can be read and written to through SFR with 8-bit unit.

Figure 8.4 XDATA Memory Area

9. I/O Ports

9.1 I/O Ports

The Z51F3221 MCU features ten groups of I/O ports (P0 ~ P9). Each port can be easily configured by software as I/O pin, internal pull up and open-drain pin to meet various system configurations and design requirements. Also P0 includes function that can generate interrupt according to change of state of the pin.

9.2 Port Register

9.2.1 Data Register (Px)

Data Register is a bidirectional I/O port. If ports are configured as output ports, data can be written to the corresponding bit of the Px. If ports are configured as input ports, the data can be read from the corresponding bit of the Px.

9.2.2 Direction Register (PxIO)

Each I/O pin can be independently used as an input or an output through the PxIO register. Bits cleared in this register will make the corresponding pin of Px to input mode. Set bits of this register will make the pin to output mode. Almost bits are cleared by a system reset, but some bits are set by a system reset.

9.2.3 Pull-up Resistor Selection Register (PxPU)

The on-chip pull-up resistor can be connected to I/O ports individually with a pull-up resistor selection register (PxPU). The pull-up register selection controls the pull-up resistor enable/disable of each port. When the corresponding bit is 1, the pull-up resistor of the pin is enabled. When 0, the pull-up resistor is disabled. All bits are cleared by a system reset.

9.2.4 Open-drain Selection Register (PxOD)

There are internally open-drain selection registers (PxOD) for P0 ~ P8 and a bit for P9. The open-drain selection register controls the open-drain enable/disable of each port. Almost ports become push-pull by a system reset, but some ports become open-drain by a system reset.

9.2.5 Debounce Enable Register (PxDB)

P0[7:0], P12, P75, and P85 support debounce function. Debounce clocks of each ports are $fx/1$, $fx/4$, and $fx/4096$.

9.2.6 P9 Control and Data Register (P9CDR)

P9 I/O pin can be independently used as an input or an output through the P92IO. Clearing the bit will make the pin in P92 to input mode, setting the bit will make the pin to output mode. P92 is a bidirectional I/O port. If P92 port is configured as an output port, data can be written to the corresponding bit of the P92. If P92 port is configured as an input port, the data can be read from the corresponding bit of the P92. The P92PU controls the pull-up resistor enable/disable of P92 port. The P92OD controls the open-drain enable/disable of P92 port. All bits in the P9CDR register are cleared by a system reset.

9.2.7 Port Function Selection Register (PFSRx)

These registers define alternative functions of ports. Please remember that these registers should be set properly for alternative port function. A reset clears the PFSRx register to '00H', which makes all pins to normal I/O ports.

9.2.8 Register Map

Table 9-1 Port Register Map

9.3 P0 Port

9.3.1 P0 Port Description

P0 is 8-bit I/O port. P0 control registers consist of P0 data register (P0), P0 direction register (P0IO), debounce enable register (P0DB), P0 pull-up resistor selection register (P0PU), and P0 open-drain selection register (P0OD). The P05 function can be selected by the PFSR0[1:0] bits of the PFSR0 register. Refer to the port function selection registers.

9.3.2 Register description for P0

P0 (P0 Data Register) : 80H

7	6	5	4	3	2	1	0
P07	P06	P05	P04	P03	P02	P01	P00
RW	RW	RW	RW	RW	RW	RW	RW

Initial value : C0H

P0[7:0] I/O Data

P0IO (P0 Direction Register) : 89H

7	6	5	4	3	2	1	0
P07IO	P06IO	P05IO	P04IO	P03IO	P02IO	P01IO	P00IO
RW	RW	RW	RW	RW	RW	RW	RW

Initial value : C0H

P0IO[7:0] P0 Data I/O Direction.
0 Input
1 Output

NOTE: EINT0 ~ EINT7 function possible when input

P0PU (P0 Pull-up Resistor Selection Register) : D4H

7	6	5	4	3	2	1	0
P07PU	P06PU	P05PU	P04PU	P03PU	P02PU	P01PU	P00PU
RW	RW	RW	RW	RW	RW	RW	RW

Initial value : 00H

P0PU[7:0] Configure Pull-up Resistor of P0 Port
0 Disable
1 Enable

P0OD (P0 Open-drain Selection Register) : 92H

7	6	5	4	3	2	1	0
P07OD	P06OD	P05OD	P04OD	P03OD	P02OD	P01OD	P00OD
RW	RW	RW	RW	RW	RW	RW	RW

Initial value : C0H

P0OD[7:0] Configure Open-drain of P0 Port
0 Push-pull output
1 Open-drain output

P0DB (P0 Debounce Enable Register): E9H

7	6	5	4	3	2	1	0
P07DB	P06DB	P05DB	P04DB	P03DB	P02DB	P01DB	P00DB
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Initial value: 00H

P0DB[7:0] Configure Debounce of P0 Port
 0 Disable
 1 Enable

- NOTES) 1. If the same level is not detected on enabled pin three or four times in a row at the sampling clock, the signal is eliminated as noise.
2. A pulse level should be input for the duration of 3 clock or more to be actually detected as a valid edge.
3. The port debounce is automatically disabled at stop mode and recovered after stop mode release.
4. Refer to the port 1 debounce enable register (P1DB) for the debounce clock of port 0.

9.4 P1 Port

9.4.1 P1 Port Description

P1 is 7-bit I/O port. P1 control registers consist of P1 data register (P1), P1 direction register (P1IO), debounce enable register (P1DB), P1 pull-up resistor selection register (P1PU), and P1 open-drain selection register (P1OD) . Refer to the port function selection registers for the P1 function selection.

9.4.2 Register description for P1

P1 (P1 Data Register) : 88H

7	6	5	4	3	2	1	0
–	P16	P15	P14	P13	P12	P11	P10
–	RW	RW	RW	RW	RW	RW	RW

Initial value : 08H

1 Enable

P75DB Configure Debounce of P75 Port

0 Disable

1 Enable

P12DB Configure Debounce of P12 Port

0 Disable

1 Enable

NOTES) 1. If the same level is not detected on enabled pin three or four times in a row at the sampling clock, the signal is eliminated as noise.

2. A pulse level should be input for the duration of 3 clock or more to be actually detected as a valid edge.

3. The port debounce is automatically disabled at stop mode and recovered after stop mode release.

9.5 P2 Port

9.5.1 P2 Port Description

P2 is 8-bit I/O port. P2 control registers consist of P2 data register (P2), P2 direction register (P2IO), P2 pull-up resistor selection register (P2PU) and P2 open-drain selection register (P2OD). Refer to the port function selection registers for the P2 function selection.

9.5.2 Register description for P2

P2 (P2 Data Register) : 90H

7	6	5	4	3	2	1	0
P27	P26	P25	P24	P23	P22	P21	P20
RW	RW	RW	RW	RW	RW	RW	RW

Initial value : F8H

P2[7:0] I/O Data

P2IO (P2 Direction Register) : 99H

7	6	5	4	3	2	1	0
P27IO	P26IO	P25IO	P24IO	P23IO	P22IO	P21IO	P20IO

Initial value : 00H

P2PU[7:0] Configure Pull-up Resistor of P2 Port
 0 Disable
 1 Enable

P2OD (P2 Open-drain Selection Register) : 94H

7	6	5	4	3	2	1	0
P27OD	P26OD	P25OD	P24OD	P23OD	P22OD	P21OD	P20OD
RW	RW	RW	RW	RW	RW	RW	RW

Initial value : F8H

P2OD[7:0] Configure Open-drain of P2 Port
 0 Push-pull output
 1 Open-drain output

9.6 P3 Port

9.6.1 P3 Port Description

P3 is 6-bit I/O port. P3 control registers consist of P3 data register (P3), P3 direction register (P3IO), P3 pull-up resistor selection register (P3PU) and P3 open-drain selection register (P3OD). Refer to the port function selection registers for the P3 function selection.

9.6.2 Register description for P3

P3 (P3 Data Register) : 98H

7	6	5	4	3	2	1	0
–	P36	P35	P34	P33	P32	P31	–
–	RW	RW	RW	RW	RW	RW	–

–	RW	RW	RW	RW	RW	RW	–

Initial value : 00H

P3IO[6:1] P3 Data I/O Direction
0 Input
1 Output

P3PU (P3 Pull-up Resistor Selection Register) : D7H

7	6	5	4	3	2	1	0
–	P36PU	P35PU	P34PU	P33PU	P32PU	P31PU	–
–	RW	RW	RW	RW	RW	RW	–

Initial value : 00H

P3PU[6:1] Configure Pull-up Resistor of P3 Port
0 Disable
1 Enable

P3OD (P3 Open-drain Selection Register) : 95H

7	6	5	4	3	2	1	0
–	P36OD	P35OD	P34OD	P33OD	P32OD	P31OD	–
–	RW	RW	RW	RW	RW	RW	–

Initial value : 00H

P3OD[6:1] Configure Open-drain of P3 Port
0 Push-pull output
1 Open-drain output

9.7 P4 Port

9.7.1 P4 Port Description

P4 is 8-bit I/O port. P4 control registers consist of P4 data register (P4), P4 direction register (P4IO), P4 pull-up resistor selection register (P4PU) and P4 open-drain selection register (P4OD). Refer to the port function selection registers for the P4 function selection.

9.7.2 Register description for P4

P4 (P4 Data Register) : A0H

7	6	5	4	3	2	1	0
P47	P46	P45	P44	P43	P42	P41	P40
RW	RW	RW	RW	RW	RW	RW	RW

RW	RW	RW	RW	RW	RW	RW	RW

Initial value : 00H

P4IO[7:0] P4 Data I/O Direction
0 Input
1 Output

P4PU (P4 Pull-up Resistor Selection Register) : DAH

7	6	5	4	3	2	1	0
P47PU	P46PU	P45PU	P44PU	P43PU	P42PU	P41PU	P40PU
RW	RW	RW	RW	RW	RW	RW	RW

Initial value : 00H

P4PU[7:0] Configure Pull-up Resistor of P4 Port
0 Disable
1 Enable

P4OD (P4 Open-drain Selection Register) : 96H

7	6	5	4	3	2	1	0
P47OD	P46OD	P45OD	P44OD	P43OD	P42OD	P41OD	P40OD
RW	RW	RW	RW	RW	RW	RW	RW

Initial value : 00H

P4OD[7:0] Configure Open-drain of P4 Port
0 Push-pull output
1 Open-drain output

9.8 P5 Port

9.8.1 P5 Port Description

P5 is 8-bit I/O port. P5 control registers consist of P5 data register (P5), P5 direction register (P5IO), P5 pull-up resistor selection register (P5PU) and P5 open-drain selection register (P5OD). Refer to the port function selection registers for the P5 function selection.

9.8.2 Register description for P5

P5 (P5 Data Register) : B0H

7	6	5	4	3	2	1	0
P57	P56	P55	P54	P53	P52	P51	P50

10. Interrupt Controller

10.1 Overview

The Z51F3221 MCU supports up to 23 interrupt sources. The interrupts have separate enable register bits associated with them, allowing software control. They can also have four levels of priority assigned to them. The non-maskable interrupt source is always enabled with a higher priority than any other interrupt source, and is not controllable by software. The interrupt controller has following features:

- Receive the request from 23 interrupt source
- 6 group priority
- 4 priority levels
- Multi Interrupt possibility
- If the requests of different priority levels are received simultaneously, the request of higher priority level is served first.
- Each interrupt source can be controlled by EA bit and each IEx bit
- Interrupt latency: 3~9 machine cycles in single interrupt system

The non-maskable interrupt is always enabled. The maskable interrupts are enabled through four pair of interrupt enable registers (IE, IE1, IE2, IE3). Each bit of IE, IE1, IE2, IE3 register individually enables/disables the corresponding interrupt source. Overall control is provided by bit 7 of IE (EA). When EA is set to '0', all interrupts are disabled: when EA is set to '1', interrupts are individually enabled or disabled through the other bits of the interrupt enable registers. The EA bit is always cleared to '0' jumping to an interrupt service vector and set to '1' executing the [RETI] instruction. The Z51F3221 MCU supports a four-level priority scheme. Each maskable interrupt is individually assigned to one of four priority levels according to IP and IP1.

Default interrupt mode is level-trigger mode basically, but if needed, it is possible to change to edge-trigger mode. Table 10-1 shows the Interrupt Group Priority Level that is available for sharing interrupt priority. Priority of a group is set by two bits of interrupt priority registers (one bit from IP, another one from IP1). Interrupt service routine serves higher priority interrupt first. If two requests of different priority levels are received simultaneously, the request of higher priority level is served prior to the lower one.

Table 10-1 Interrupt Group Priority Level

Interrupt Group	Highest Lowest				
0 (Bit0)	Interrupt 0	Interrupt 6	Interrupt 12	Interrupt 18	Highest Lowest
1 (Bit1)	Interrupt 1	Interrupt 7	Interrupt 13	Interrupt 19	
2 (Bit2)	Interrupt 2	Interrupt 8	Interrupt 14	Interrupt 20	
3 (Bit3)	Interrupt 3	Interrupt 9	Interrupt 15	Interrupt 21	
4 (Bit4)	Interrupt 4	Interrupt 10	Interrupt 16	Interrupt 22	
5 (Bit5)	Interrupt 5	Interrupt 11	Interrupt 17	Interrupt 23	

10.2 External Interrupt

The external interrupt on INT1, INT2 and INT5 pins receive various interrupt request depending on the external interrupt edge register 0 (EIEDGE0), external interrupt edge register 1 (EIEDGE1), external interrupt polarity register 0 (EIPOL0) and external interrupt polarity register 1 (EIPOL1) as shown in Figure 10.1. Also each external interrupt source has enable/disable bits. The External interrupt flag register 0 (EIFLAG0) and external interrupt flag register 1 (EIFLAG1) provides the status of external interrupts.

Figure 10.1 External Interrupt Description

10.3 Block Diagram

Figure 10.2 Block Diagram of Interrupt

- NOTES) 1. The release signal for stop/idle mode may be generated by all interrupt sources which are enabled without reference to the priority level.
2. An interrupt request is delayed while data are written to IE, IE1, IE2, IE3, IP, IP1, and PCON register.

10.4 Interrupt Vector Table

The interrupt controller supports 24 interrupt sources as shown in the Table 10-2. When interrupt is served, long call instruction (LCALL) is executed and program counter jumps to the vector address. All interrupt requests have their own priority order.

Table 10-2 Interrupt Vector Address Table

Interrupt Source	Symbol	Interrupt Enable Bit	Polarity	Mask	Vector Address
Hardware Reset	RESETB	0 0	0	Non-Maskable	0000H
-	INT0	IE.0	1	Maskable	0003H
External Interrupt 10	INT1	IE.1	2	Maskable	000BH
External Interrupt 13	INT2	IE.2	3	Maskable	0013H
-	INT3	IE.3	4	Maskable	001BH
-	INT4	IE.4	5	Maskable	0023H
External Interrupt 0 - 7	INT5	IE.5	6	Maskable	002BH
-	INT6	IE1.0	7	Maskable	0033H
-	INT7	IE1.1	8	Maskable	003BH
-	INT8	IE1.2	9	Maskable	0043H
UART Rx Interrupt	INT9	IE1.3	10	Maskable	004BH
UART Tx Interrupt	INT10	IE1.4	11	Maskable	0053H
SIO Interrupt	INT11	IE1.5	12	Maskable	005BH
T0 Overflow Interrupt	INT12	IE2.0	13	Maskable	0063H
T0 Match Interrupt	INT13	IE2.1	14	Maskable	006BH
T1 Match Interrupt	INT14	IE2.2	15	Maskable	0073H
T2 Match Interrupt	INT15	IE2.3	16	Maskable	007BH
T3 Match Interrupt	INT16	IE2.4	17	Maskable	0083H
T3 Overflow Interrupt	INT17	IE2.5	18	Maskable	008BH
ADC Interrupt	INT18	IE3.0	19	Maskable	0093H
-	INT19	IE3.1	20	Maskable	009BH
WT Interrupt	INT20	IE3.2	21	Maskable	00A3H
WDT Interrupt	INT21	IE3.3	22	Maskable	00ABH
BIT Interrupt	INT22	IE3.4	23	Maskable	00B3H
-	INT23	IE3.5	24	Maskable	00BBH

For maskable interrupt execution, EA bit must set '1' and specific interrupt must be enabled by writing '1' to associated bit in the IEx. If an interrupt request is received, the specific interrupt request flag is set to '1'. And it remains '1' until CPU accepts interrupt. If the interrupt is served, the interrupt request flag will be cleared automatically.

10.5 Interrupt Sequence

An interrupt request is held until the interrupt is accepted or the interrupt latch is cleared to '0' by a reset or an instruction. Interrupt acceptance always generates at last cycle of the instruction. So instead of fetching the current instruction, CPU executes internally LCALL instruction and saves the PC at stack. For the interrupt service routine, the interrupt controller gives the address of LJMP instruction to CPU. Since the end of the execution of current instruction, it needs 3~9 machine cycles to go to the interrupt service routine. The interrupt service task is terminated by the interrupt return instruction [RETI]. Once an interrupt request is generated, the following process is performed.

Figure 10.3 Interrupt Vector Address Table

10.6 Effective Timing after Controlling Interrupt Bit

Case a) Control Interrupt Enable Register (IE, IE1, IE2, IE3)

Figure 10.4 Effective Timing of Interrupt Enable Register

Case b) Interrupt flag Register

Figure 10.5 Effective Timing of Interrupt Flag Register

10.7 Multi Interrupt

If two requests of different priority levels are received simultaneously, the request of higher priority level is served first. If more than one interrupt request are received, the interrupt polling sequence determines which request is served first by hardware. However, for special features, multi-interrupt processing can be executed by software.

Figure 10.6 Effective Timing of Interrupt

Figure 10.6 shows an example of multi-interrupt processing. While INT1 is served, INT0 which has higher priority than INT1 is occurred. Then INT0 is served immediately and then the remain part of INT1 service routine is executed. If the priority level of INT0 is same or lower than INT1, INT0 will be served after the INT1 service has completed.

An interrupt service routine may be only interrupted by an interrupt of higher priority and, if two interrupts of different priority occur at the same time, the higher level interrupt will be served first. An interrupt cannot be interrupted by another interrupt of the same or a lower priority level. If two interrupts of the same priority level occur simultaneously, the service order for those interrupts is determined by the scan order.

10.8 Interrupt Enable Accept Timing

Figure 10.7 Interrupt Response Timing Diagram

10.9 Interrupt Service Routine Address

10.10 Saving/Restore General-Purpose Registers

Figure 10.9 Saving/Restore Process Diagram and Sample Source

10.11 Interrupt Timing

Figure 10.10 Timing Chart of Interrupt Acceptance and Interrupt Return Instruction

Interrupt sources are sampled at the last cycle of a command. If an interrupt source is detected the lower 8-bit of interrupt vector (INT_VEC) is decided. M8051W core makes interrupt acknowledge at the first cycle of a command, and executes long call to jump to interrupt service routine.

NOTE) command cycle CLPx: L=Last cycle, 1=1st cycle or 1st phase, 2=2nd cycle or 2nd phase

10.12 Interrupt Register Overview

10.12.1 Interrupt Enable Register (IE, IE1, IE2, IE3)

Interrupt enable register consists of global interrupt control bit (EA) and peripheral interrupt control bits. Total 24 peripherals are able to control interrupt.

10.12.2 Interrupt Priority Register (IP, IP1)

The 24 interrupts are divided into 6 groups which have each 4 interrupt sources. A group can be assigned 4 levels interrupt priority using interrupt priority register. Level 3 is the highest priority, while level 0 is the lowest priority. After a reset IP and IP1 are cleared to '00H'. If interrupts have the same priority level, lower number interrupt is served first.

10.12.3 External Interrupt Flag Register (EIFLAG0, EIFLAG1)

The external interrupt flag register 0 (EIFLAG0) and external interrupt flag register 1 (EIFLAG1) are set to '1' when the external interrupt generating condition is satisfied. The flag is cleared when the interrupt service routine is executed. Alternatively, the flag can be cleared by writing '0' to it.

10.12.4 External Interrupt Edge Register (EIEDGE0, EIEDGE1)

The external interrupt edge register 0 (EIEDGE0) and external interrupt edge register 1 (EIEDGE1) determine which type of interrupt will be used, edge sensitive or level sensitive. Initially, default value sets level sensitive interrupt. For level sensitive interrupt, write '0' to the related bit. For edge sensitive interrupt, write '1' to the related bit.

10.12.5 External Interrupt Polarity Register (EIPOL0, EIPOL1)

According to EIEDGE0 and EIEDGE1 registers, the external interrupt polarity register 0 (EIPOL0) and external interrupt polarity register 1 (EIPOL1) have different meaning. If level sensitive interrupt is selected, EIPOL0 and EIPOL1 determine the level of interrupt (high or low level). If edge sensitive interrupt is selected, EIPOL0 and EIPOL1 determine the edge of interrupt (rising or falling edge).

10.12.6 External Interrupt Enable Register (EIENAB0, EIENAB1)

When the external interrupt enable register 0 (EIENAB0) and external interrupt enable register 1 (EIENAB1) register are written to '1', the corresponding external pin interrupt is enabled.

10.12.7 Register Map

Table 10-3 Interrupt Register Map

Name	Address	Dir	Default	Description
IE	A8H	R/W	00H	Interrupt Enable Register
IE1	A9H	R/W	00H	Interrupt Enable Register 1

EIPOL1	A6H	R/W	00H	External Interrupt Polarity Register 1
EIENAB1	A3H	R/W	00H	External Interrupt Enable Register 1

10.13 Interrupt Register Description

The interrupt register is used for controlling interrupt functions. Also it has external interrupt control registers. The interrupt register consists of interrupt enable register (IE), interrupt enable register 1 (IE1), interrupt enable register 2 (IE2) and interrupt enable register 3 (IE3). For external interrupt, it consists of external interrupt flag register 0 (EIFLAG0), external interrupt edge register 0 (EIEDGE0), external interrupt polarity register 0 (EIPOL0), external interrupt enable register 0 (EIENAB0), external interrupt flag register 1 (EIFLAG1), external interrupt edge register 1 (EIEDGE1), external interrupt polarity register 1 (EIPOL1) and external interrupt enable register 1 (EIENAB1).

10.13.1 Register Description for Interrupt

IE (Interrupt Enable Register) : A8H

7	6	5	4	3	2	1	0

Initial value : 00H

**IP[5:0],
IP1[5:0]**

Select Interrupt Group Priority

IP1x	IPx	Description
0	0	level 0 (lowest)
0	1	level 1
1	0	level 2
1	1	level 3 (highest)

EIFLAG0 (External Interrupt Flag Register 0) : ADH

7	6	5	4	3	2	1	0
FLAG7	FLAG6	FLAG5	FLAG4	FLAG3	FLAG2	FLAG1	FLAG0
RW	RW	RW	RW	RW	RW	RW	RW

Initial value : 00H

EIFLAG0[7:0]

When an External Interrupt is occurred, the flag becomes '1'. The flag is cleared only by writing '0' to the bit. So, the flag should be cleared by software.

0	External Interrupt 0 ~ 7 not occurred
1	External Interrupt 0 ~ 7 occurred

EIEDGE0 (External Interrupt Edge Register 0): AEH

7	6	5	4	3	2	1	0
EDGE7	EDGE6	EDGE5	EDGE4	EDGE3	EDGE2	EDGE1	EDGE0
RW-	RW-	RW	RW	RW	RW	RW	RW

Initial value : 00H

EIEDGE0[7:0]

Determines which type of interrupt will be used; edge sensitive or level sensitive.

0	Level (default)
1	Edge

EIPOL0 (External Interrupt Polarity Register 0): AFH

7	6	5	4	3	2	1	0
POL7	POL6	POL5	POL4	POL3	POL2	POL1	POL0
RW	RW	RW	RW	RW	RW	RW	RW

Initial value: 00H

EIPOL0[7:0] According to EIEDGE0, external interrupt polarity register has different meaning. If EIEDGE0 is set to select level sensitive interrupt, EIPOL0 determines high or low level interrupt. If EIEDGE0 is set to select edge sensitive interrupt, EIPOL0 determines rising or falling edge interrupt.

Level case:

- 0 When High level, Interrupt occurred (Default)
- 1 When Low level, Interrupt occurred

Edge case:

- 0 When Rising edge, Interrupt occurred (Default)
- 1 When Falling edge, Interrupt occurred

EIENAB0 (External Interrupt Enable Register 0) : ACH

7	6	5	4	3	2	1	0
ENAB7	ENAB6	ENAB5	ENAB4	ENAB3	ENAB2	ENAB1	ENAB0
RW-	RW	RW	RW	RW	RW	RW	RW

Initial value : 00H

EIENAB0[7:0] Control External Interrupt 0~7 (P0[7:0])

- 0 Disable (Default)
- 1 Enable

EIFLAG1 (External Interrupt Flag Register 1) : A4H

7	6	5	4	3	2	1	0
-	-	-	-	-	-	FLAG13	FLAG10
-	-	-	-	-	-	RW	RW

Initial value : 00H

EIFLAG1[1:0] When an External Interrupt is occurred, the flag becomes '1'. The flag is cleared only by writing '0' to the bit or automatically cleared by INT_ACK signal.

- 0 External Interrupt 10 and 13 not occurred
- 1 External Interrupt 10 and 13 occurred

EIEDGE1 (External Interrupt Edge Register 1) : A5H

7	6	5	4	3	2	1	0
-	-	-	-	-	-	EDGE13	EDGE10
-	-	-	-	-	-	RW	RW

Initial value : 00H

EIEDGE1[1:0] Determines which type of interrupt will be used; edge sensitive or level sensitive.

- 0 Level (default)
- 1 Edge

EIPOL1 (External Interrupt Polarity Register 1) : A6H

EIPOL1[1:0] According to EIEDGE1, external interrupt polarity register has different meaning. If EIEDGE1 is set to select level sensitive interrupt, EIPOL1 determines high or low level interrupt. If EIEDGE1 is set to select edge sensitive interrupt, EIPOL1 determines rising or falling edge interrupt.

Level case:

0 When High level, Interrupt occurred (Default)

1 When Low level, Interrupt occurred

Edge case:

0 When Rising edge, Interrupt occurred (Default)

1 When Falling edge, Interrupt occurred

11. Peripheral Hardware

11.1 Clock Generator

11.1.1 Overview

As shown in Figure 11.1, the clock generator produces the basic clock pulses which provide the system clock to be supplied to the CPU and the peripheral hardware. It contains main/sub-frequency clock oscillator. The main/sub clock operation can be easily obtained by attaching a crystal between the XIN/SXIN and XOUT/SXOUT pin, respectively. The main/sub clock can be also obtained from the external oscillator. In this case, it is necessary to put the external clock signal into the XIN/SXIN pin and open the XOUT/SXOUT pin. The default system clock is 1MHz INT-RC Oscillator and the default division rate is eight. In order to stabilize system internally, it is used 1MHz INT-RC oscillator on POR.

- Calibrated Internal RC Oscillator (8 MHz)
 - . INT-RC OSC/1 (8 MHz)
 - . INT-RC OSC/2 (4 MHz)
 - . INT-RC OSC/4 (2 MHz)
 - . INT-RC OSC/8 (1 MHz, Default system clock)
- Main Crystal Oscillator (1~12 MHz)
- Sub Crystal Oscillator (32.768 kHz)
- Internal WDTRC Oscillator (6 kHz)

WONS

Control the Operation of WDT RC-Oscillation during STOP mode

- 0 WDT RC-Oscillator is disabled at STOP mode
- 1 WDT RC-Oscillator is enabled at STOP mode

NOTES)

1. When this bit is "1", the WDT RC oscillator (6kHz) is oscillated and selected as the clock source of the WDT block in the STOP mode, but the WDT RC stops and the BIT overflow clock is the clock source for the WDT block at normal mode.
2. When this bit is "0", the WDT RC is always stopped and the BIT overflow clock is selected as the clock source for the WDT block

PSAVE

Power Save Mode Control Bit

- 0 Normal circuit for sub oscillator
- 1 Power saving circuit for sub oscillator

NOTES)

1. A capacitor (0.1μF) should be connected between VREG and VSS when the sub oscillator is used to power saving mode.
2. The PSAVE automatically cleared to '0' when the sub oscillator is stopped by SCLKE or CPU is entered into STOP mode in sub operating mode.

SCLK [1:0]

1	Enable operation of X-TAL

SCLKE Control the Operation of the External Sub Oscillator

0	Disable operation of SX-TAL
1	Enable operation of SX-TAL

11.2 Basic Interval Timer

11.2.1 Overview

The Z51F3221 MCU features one 8-bit basic interval timer that is free-run and can't stop. Block diagram is shown in Figure 11.2. In addition, the basic interval timer generates the time base for watchdog timer counting. It also provides a basic interval timer interrupt (BITIFR).

The Z51F3221 MCU has these basic interval timer (BIT) features:

- During Power On, BIT gives a stable clock generation time
- On exiting Stop mode, BIT gives a stable clock generation time
- As timer function, timer interrupt occurrence

11.3 Watch Dog Timer

11.3.1 Overview

The watchdog timer rapidly detects the CPU malfunction such as endless looping caused by noise or something like that, and resumes the CPU to the normal state. The watchdog timer signal for malfunction detection can be used as either a CPU reset or an interrupt request. When the watchdog timer is not being used for malfunction detection, it can be used as a timer to generate an interrupt at fixed intervals. It is possible to use free running 8-bit timer mode (WDTRSON='0') or watch dog timer mode (WDTRSON='1') as setting WDTCR[6] bit. If WDTCR[5] is written to '1', WDT counter value is cleared and counts up. After 1 machine cycle, this bit is cleared to '0' automatically. The watchdog timer consists of 8-bit binary counter and the watchdog timer data register. When the value of 8-bit binary counter is equal to the 8 bits of WDTCNT, the interrupt request flag is generated. This can be used as Watchdog timer interrupt or reset of CPU in accordance with the bit WDTRSON.

The input clock source of watch dog timer is the BIT overflow. The interval of watchdog timer interrupt is decided by BIT overflow period and WDTDR set value. The equation can be described as

$$\text{WDT Interrupt Interval} = (\text{BIT Interrupt Interval}) \times (\text{WDTDR Value} + 1)$$

WDTIFR When WDT Interrupt occurs, this bit becomes '1'. For clearing bit, write '0' to this bit or auto clear by INT_ACK signal.
 0 WDT Interrupt no generation
 1 WDT Interrupt generation

11.4 Watch Timer

11.4.1 Overview

The watch timer has the function for RTC (Real Time Clock) operation. It is generally used for RTC design. The internal structure of the watch timer consists of the clock source select circuit, timer counter circuit, output select circuit, and watch timer control register. To operate the watch timer, determine the input clock source, output interval, and set WTEN to '1' in watch timer control register (WTCR). It is able to execute simultaneously or individually. To stop or reset WT, clear the WTEN bit in WTCR register. Even if CPU is STOP mode, sub clock is able to be so alive that WT can continue the operation. The watch timer counter circuits may be composed of 21-bit counter which contains low 14-bit with binary counter and high 7-bit counter in order to raise resolution. In WTDR, it can control WT clear and set interval value at write time, and it can read 7-bit WT counter value at read time.

The watch timer supplies the clock frequency for the LCD driver (f_{LCD}). Therefore, if the watch timer is disabled, the LCD driver controller does not operate.

11.4.2 Block Diagram

11.4.4 Watch Timer Register Description

The watch timer register consists of watch timer counter register (WTCNT), watch timer data register (WTDR), and watch timer control register (WTCR). As WTCR is 6-bit writable/ readable register, WTCR can control the clock source (WTCK[1:0]), interrupt interval (WTIN[1:0]), and function enable/disable (WTEN). Also there is WT interrupt flag bit (WTIFR).

WTIN[1:0]	Determine interrupt interval	
	WTIN1	WTIN0 Description
	0	0 $f_{WCK}/2^7$
	0	1 $f_{WCK}/2^{13}$
	1	0 $f_{WCK}/2^{14}$
	1	1 $f_{WCK}/(2^{14} \times (7\text{bit WTDR Value}+1))$
WTCK[1:0]	Determine Source Clock	
	WTCK1	WTCK0 Description
	0	0 f_{SUB}
	0	1 $f_X/256$
	1	0 $f_X/128$
	1	1 $f_X/64$

NOTE) f_X – System clock frequency (Where $f_X = 4.19\text{MHz}$)

f_{SUB} – Sub clock oscillator frequency (32.768kHz)

f_{WCK} – Selected Watch timer clock

f_{LCD} – LCD frequency (Where $f_X = 4.19\text{MHz}$, $WTCK[1:0] = '10'$; $f_{LCD} = 1024\text{Hz}$)

11.5 Timer 0

11.5.1 Overview

The 8-bit timer 0 consists of multiplexer, timer 0 counter register, timer 0 data register, timer 0 capture data register and timer 0 control register (T0CNT, T0DR, T0CDR, T0CR).

It has three operating modes:

- 8-bit timer/counter mode
- 8-bit PWM output mode
- 8-bit capture mode

The timer/counter 0 can be clocked by an internal or an external clock source (EC0). The clock source is selected by clock selection logic which is controlled by the clock selection bits (T0CK[2:0]).

- TIMER0 clock source: $f_x/2$, 4, 8, 32, 128, 512, 2048, EC0

In the capture mode, by EINT10, the data is captured into input capture data register (T0CDR). In timer/counter mode, whenever counter value is equal to T0DR, T0O port toggles. Also the timer 0 outputs PWM waveform through PWM0O port in the PWM mode.

Table 11-5 Timer 0 Operating Modes

T0EN	T0_PE	T0MS[1:0]	T0CK[2:0]	Timer 0
1	1	00	XXX	8 Bit Timer/Counter Mode
1	1	01	XXX	8 Bit PWM Mode
1	0	1X	XXX	8 Bit Capture Mode

11.5.2 8-Bit Timer/Counter Mode

The 8-bit timer/counter mode is selected by control register as shown in Figure 11.6.

The 8-bit timer have counter and data register. The counter register is increased by internal or external clock input. Timer 0 can use the input clock with one of 2, 4, 8, 32, 128, 512 and 2048 prescaler division rates (T0CK[2:0]). When the value of T0CNT and T0DR is identical in timer 0, a match signal is generated and the interrupt of Timer 0 occurs. T0CNT value is automatically cleared by match signal. It can be also cleared by software (T0CC).

The external clock (EC0) counts up the timer at the rising edge. If the EC0 is selected as a clock source by T0CK[2:0], EC0 port should be set to EC0 function by PFSR6[3:2] or PFSR8[1:0] bits.

Figure 11.6 8-Bit Timer/Counter Mode for Timer 0

Figure 11.7 8-Bit Timer/Counter 0 Example

11.5.3 8-Bit PWM Mode

The timer 0 has a high speed PWM (Pulse Width Modulation) function. In PWM mode, T0O/PWM00 pin outputs up to 8-bit resolution PWM output. This pin should be configured as a PWM output by setting T0_PE to '1' and the T0O/PWM00 function by PFSR6[1:0] or PFSR7[7:6] bits. In the 8-bit timer/counter mode, a match signal is generated when the counter value is identical to the value of T0DR. When the value of T0CNT and T0DR is identical in timer 0, a match signal is generated and the interrupt of timer 0 occurs. In PWM mode, the match signal does not clear the counter. Instead, it runs continuously, overflowing at "FFH", and then continues incrementing from "00H". The timer 0 overflow interrupt is generated whenever a counter overflow occurs. T0CNT value is cleared by software (T0CC) bit.

Figure 11.8 8-Bit PWM Mode for Timer 0

Figure 11.9 PWM Output Waveforms in PWM Mode for Timer 0

11.5.4 8-Bit Capture Mode

The timer 0 capture mode is set by T0MS[1:0] as '1x'. The clock source can use the internal/external clock. Basically, it has the same function as the 8-bit timer/counter mode and the interrupt occurs when T0CNT is equal to T0DR. T0CNT value is automatically cleared by match signal and it can be also cleared by software (T0CC).

This timer interrupt in capture mode is very useful when the pulse width of captured signal is wider than the maximum period of timer.

The capture result is loaded into T0CDR. In the timer 0 capture mode, timer 0 output (T0O) waveform is not available.

According to EIEDGE1 and EIPOL1 registers setting, the external interrupt EINT10 function is chosen. Of course, the EINT10 pin must be set to an input port.

T0CDR and T0DR are in the same address. In the capture mode, reading operation reads T0CDR, not T0DR and writing operation will update T0DR.

NOTE) Match Interrupt is generated in Capture mode.

11.6 Timer 1

11.6.1 Overview

The 8-bit timer 1 consists of multiplexer, timer 1 counter register, timer 1 data high/low register, and timer 1 control register (T1CNT, T1DRH, T1DRL, T1CR) . For carrier mode, it has the carrier control register (CARCR).

It has two operating modes:

- 8-bit timer/counter mode
- 8-bit carrier mode

The timer/counter 1 can be clocked by an internal clock source. The clock source is selected by clock selection logic which is controlled by the clock selection bits (T1CK[1:0]).

- TIMER1 clock source: $f_x/1$, $f_x/2$, $f_x/4$, $f_x/8$

In the carrier mode, Timer 1 can be used to generate the carrier frequency or a remote controller signal. Timer 1 can output the comparison result between T1CNT & T1DRH/L and carrier frequency through REM port. T1CNT value is cleared by hardware.

Table 11-7 Timer 1 Operating Modes

T1EN	REM_PE	CAR1	T1CK[1:0]	CMOD	Timer 1
1	1	0	XXX	0	8 Bit Timer/Counter
1	1	1	XXX	0	8 Bit Carrier (One-shot)
1	1	1	XXX	1	8 Bit Carrier (Repeat)

11.6.2 8-Bit Timer/Counter 1 Mode

The 8-bit timer/counter mode is selected by control register as shown in Figure 11.13.

The 8-bit timer have counter and data register. The counter register is increased by internal clock source. Timer 1 can use the input clock with one of 1, 2, 4 and 8 prescaler division rates (T1CK[1:0]). When the value of T1CNT and T1DRH is identical in Timer 1, a match signal is generated and the interrupt of Timer 1 occurs. The match signal generates a timer 1 interrupt and clear the counter. The timer 1 interval can be output through REM port.

Figure 11.14 8-Bit Timer/Counter Mode for Timer 1

Figure 11.15 8-Bit Timer/Counter 1 Example

Figure 11.16 8-Bit Timer/Counter 1 Counter Operation

11.6.3 8-Bit Timer 1 Carrier Frequency Mode.

The carrier frequency and the pulse of data are calculated by the formula in the following sheet .The Figure 11.16 shows the block diagram of Timer 1 for carrier frequency mode.

Figure 11.17 Carrier Mode for Timer 1

NOTE) When one of T1DRH and T1DRL values is "00H", the carrier frequency generator (REM) output always becomes a "High" or "Low". At that time, Timer 1 Interrupt Flag Bit (T1IFR) is not set.

11.6.4 Carrier Output Pulse Width Calculatins

To generate the above repeated waveform consisted of low period time (t_{LOW}), and high period time (t_{HIGH}).

When REMO = 0,

$$t_{LOW} = (T1DRL + 1) \times 1/f_{T1}, 0H < T1DRL < 100H, \text{ where } f_{T1} = \text{The selected clock.}$$

$$t_{HIGH} = (T1DRH + 1) \times 1/f_{T1}, 0H < T1DRH < 100H, \text{ where } f_{T1} = \text{The selected clock.}$$

When REMO = 1,

$$t_{LOW} = (T1DRH + 1) \times 1/f_{T1}, 0H < T1DRH < 100H, \text{ where } f_{T1} = \text{The selected clock.}$$

$$t_{HIGH} = (T1DRL + 1) \times 1/f_{T1}, 0H < T1DRL < 100H, \text{ where } f_{T1} = \text{The selected clock.}$$

To make $t_{LOW} = 24 \mu s$ and $t_{HIGH} = 15 \mu s$. $f_X = 4 \text{ MHz}$, $f_{T1} = 4 \text{ MHz}/4 = 1 \text{ MHz}$

When REMO = 0,

$$t_{LOW} = 24 \mu s = (T1DRL + 1) / f_{T1} = (T1DRL + 1) \times 1 \mu s, T1DRL = 22.$$

$$t_{HIGH} = 15 \mu s = (T1DRH + 1) / f_{T1} = (T1DRH + 1) \times 1 \mu s, T1DRH = 13.$$

When REMO = 1,

$$t_{LOW} = 24 \mu s = (T1DRH + 1) / f_{T1} = (T1DRH + 1) \times 1 \mu s, T1DRH = 22.$$

$$t_{HIGH} = 15 \mu s = (T1DRL + 1) / f_{T1} = (T1DRL + 1) \times 1 \mu s, T1DRL = 13.$$

11.7 Timer 2

11.7.1.1 Overview

The 16-bit timer 2 consists of multiplexer, timer 2 counter register high/low, timer 2 data register high/low, and timer 2 control register (T2CNTH, T2CNTL, T2DRH, T2DRL, T2CR). It can be used as an internal 16-bit timer/counter 2 without a port output function.

The 16-bit timer 2 is able to use the divided clock of the system clock selected from prescaler output. T1M (timer 1 match signal) can be also used as the clock source of Timer 2.

11.8 Timer 3

11.8.1 Overview

The 16-bit timer 3 consists of multiplexer, timer 3 counter high/low register, timer 3 data high/low register, timer 3 capture data high/low register, and timer 3 control register (T3CNTH, T3CNTL, T3DRH, T3DRL, T3CDRH, T3CDRL, T3CR).

It has three operating modes:

- 16-bit timer/counter mode
- 16-bit PWM output mode
- 16-bit capture mode

The timer/counter can be clocked by an internal or an external clock source (EC3). The clock source is selected by clock selection logic which is controlled by the clock selection bits (T3CK[2:0]).

- TIMER3 clock source: $f_x/1, 2, 16, 64, 256, 512, 1024$ and EC3

In the capture mode, by EINT13, the data is captured into input capture data high/low register (T3CDRH, T3CDRL). Timer 3 outputs the comparison result between counter and data register through T3O port in 16-bit timer/counter mode. Also Timer 3 outputs PWM waveform through PWM3O port in the PWM mode.

Table 11-10 Timer 3 Operating Modes

T3EN	T3_PE	T3MS[1:0]	T3CK[2:0]	Timer 3
1	1	00	XXX	16 Bit Timer/Counter Mode
1	1	01	XXX	16 Bit PWM Mode
1	0	1X	XXX	16 Bit Capture Mode

11.8.2 16-Bit Timer/Counter Mode

The 16-bit timer/counter mode is selected by control register as shown in Figure 11.20.

The 16-bit timer have counter and data register. The counter register is increased by internal or external clock input. Timer 3 can use the input clock with one of 1, 2, 16, 64, 256, 512 and 1024 prescaler division rates (T3CK[2:0]).

A 16-bit timer/counter register T3CNTH, T3CNTL are incremented from 0000H to FFFFH until it matches T3DRH, T3DRL and then cleared to 0000H. The match signal output generates the Timer 3 Interrupt. The T3CNTH, T3CNTL value is automatically cleared by match signal. It can be also cleared by software (T3CC).

The external clock (EC3) counts up the timer at the rising edge. If the EC3 is selected as a clock source by T3CK[2:0], EC3 port should be set to the EC3 function by PFSR0[1:0] or PFSR0[4:3] bits.

Figure 11.21 16-Bit Timer/Counter Mode for Timer 3

11.8.3 16-Bit PWM Mode

The 16-bit timer 3 has a high speed PWM (Pulse Width Modulation) function. In PWM mode, T3O/PWM3O pin outputs up to 16-bit resolution PWM output. This pin should be configured as a PWM output by setting T3_PE to '1' and the T3O/PWM3O function by PFSR02 bit. As in the 16-bit timer/counter mode, a match signal is generated when the counter value is identical to the value of T3DRH/L. When the value of T3CNTH, T3CNTL and the value of T3DRH, T3DRL are identical in Timer 3 respectively, a match signal is generated and the interrupt of Timer 3 occurs. In PWM mode, the match signal does not clear the counter. Instead, it runs continuously, overflowing at "FFFFH", and then continues incrementing from "0000H". The timer 3 overflow interrupt is generated whenever a counter overflow occurs. The T3CNTH, T3CNTL values are cleared by software (T3CC) bit.

Figure 11.22 16-Bit PWM Mode for Timer 3

The 16-bit timer 3 capture mode is set by T3MS[1:0] as '1X'. The clock source can use the internal/external clock. Basically, it has the same function as the 16-bit timer/counter mode and the interrupt occurs when T3CNTH/L is equal to T3DRH/L. The T3CNTH, T3CNTL values are automatically cleared by match signal. It can be also cleared by software (T3CC).

The capture result is loaded into T3CDRH, T3CDRL.

T3CDRH, T3CDRL and T3DRH, T3DRL are in same address respectively. In the capture mode, reading operation reads the T3CDRH, T3CDRL, not T3DRH, T3DRL and writing operation will update T3DRH and T3DRL.

11.9 Buzzer Driver

11.9.1 Overview

The Buzzer consists of 8 bit counter, buzzer data register (BUZDR), and buzzer control register (BUZCR). The Square Wave (61.035Hz~125.0 kHz @8MHz) is outputted through P13/EC3/BUZO or P05/EINT5/EC3/BUZO pin. The buzzer data register (BUZDR) controls the bsuzzer frequency (look at the following expression). In buzzer control register (BUZCR), BUCK[1:0] selects source clock divided by prescaler.

$$f_{\text{BUZ}}(\text{Hz}) = \frac{\text{Oscillator Frequency}}{2 \times \text{Prescaler Ratio} \times (\text{BUZDR} + 1)}$$

Table 11-12 Buzzer Frequency at 8 MHz

11.10 SIO

11.10.1 Overview

The serial input/output is used to transmit/receive 8-bit data serially. The serial input/output(SIO) module is a useful serial interface to communicate with other peripheral of microcontroller devices. This SIO is 8-bit clock synchronous type and consists of SIO pre-scaler register, SIO data register, SIO control register, and control circuit as illustrated in Figure 11.25. The SO pin is designed to input and output. So SIO can operate with two pins minimally. Pin P14/SO, P15/SCK and P16/SI pins are controlled by the SIO control register (SIOCR) and port function selection control registers (PFSR05, PFSR0[7:6], and PFSR10).

The contents of the SIO data register can be written into or read out by software. The data in the SIO data register can be shifted synchronously with the transfer clock signal. SIO data register (SIODR) is an 8 bit shift register. MSB-first and LSB-first transfers are possible.

11.10.2 Block Diagram

Figure 11.26 SIO Block Diagram

NOTE) The system clock should be greater than the SIO input clock. So, take care of using the external clock.

11.10.3 SIO Pre-Scaler Register (SIOPS)

SIOPS contains the SIO pre-scaler value. The SIO clock rate (baud rate) is calculated by the following formula.

$$\text{Baud rate} = \text{Input clock (fx/4)} / (\text{Pre-scaler value} + 1)$$

or SCK input clock, where the input clock is fx/4

$$\text{Baud rate} = (\text{fx/4}) / (\text{SIOPS} + 1)$$

Figure 11.27 SIO Pre-Scaler Register (SIOPS)

11.10.4 The usage of SIO

1. Select transmitter/receiver mode.
2. In transmitter mode, write data to be sent to SIODR.
3. Set CCLR to "1" to clear SIO counter and start shifting.
4. If Tx or Rx is completed, the SiO interrupt is generated and SIOIFR is set to "1".
5. In receiver mode, the received data can be acquired by reading SIODR.

11.10.5 SIO Timing Diagram

NOTE) The serial I/O interrupt flag (SIOIFR bit) is in the timer interrupt flag register (TIFR register).

11.11 12-Bit A/D Converter

11.11.1 Overview

The analog-to-digital converter (A/D) allows conversion of an analog input signal to corresponding 12-bit digital value. The A/D module has eight analog inputs. The output of the multiplexer is the input into the converter which generates the result through successive approximation. The A/D module has four registers which are the A/D converter control high register (ADCCRH), A/D converter control low register (ADCCRL), A/D converter data high register (ADCDRH), and A/D converter data low register (ADCDDL). The channels to be converted are selected by setting ADSEL[3:0]. To execute A/D conversion, ADST bit should be set to '1'. The register ADCDRH and ADCDDL contains the results of the A/D conversion. When the conversion is completed, the result is loaded into the ADCDRH and ADCDDL, the A/D conversion status bit AFLAG is set to '1', and the A/D interrupt is set. During A/D conversion, AFLAG bit is read as '0'.

11.11.2 Conversion Timing

The A/D conversion process requires 4 steps (4 clock edges) to convert each bit and 10 clocks to set up A/D conversion. Therefore, total of 58 clocks are required to complete a 12-bit conversion: When f_{xx}/8 is selected for conversion clock with a 12MHz f_{xx} clock frequency, one clock cycle is 0.66 μs. Each bit conversion requires 4 clocks, the conversion rate is calculated as follows:

$$4 \text{ clocks/bit} \times 12 \text{ bits} + \text{set-up time} = 58 \text{ clocks,}$$

$$58 \text{ clock} \times 0.66 \mu\text{s} = 38.28 \mu\text{s at } 1.5 \text{ MHz (12 MHz/8)}$$

NOTE : The A/D converter needs at least 20 μs for conversion time. So you must set the conversion time more than 20 μs.

11.12 UART

11.12.1 Overview

The universal synchronous and asynchronous serial receiver and transmitter (UART) is a highly flexible serial communication device. The main features are listed below.

- Full Duplex Operation (Independent Serial Receive and Transmit Registers)
- Asynchronous or Synchronous Operation
- Baud Rate Generator
- Supports Serial Frames with 5,6,7,8, or 9 Data Bits and 1 or 2 Stop Bits
- Odd or Even Parity Generation and Parity Check Supported by Hardware
- Data OverRun Detection
- Framing Error Detection
- Three Separate Interrupts on TX Complete, TX Data Register Empty and RX Complete

UART has two main parts of clock generator, transmitter and receiver. The clock generation logic consists of synchronization logic for external clock input used by synchronous operation, and the baud rate generator for asynchronous or master synchronous operation. The Transmitter consists of a single write buffer, a serial shift register, parity generator and control logic for handling different serial frame formats. The write buffer allows continuous transfer of data without any delay between frames. The receiver is the most complex part of the UART module due to its clock and data recovery units. The recovery unit is used for asynchronous data reception. In addition to the recovery unit, the receiver includes a parity checker, a shift register, a two-level receive FIFO (UARTDR) and control logic. The receiver supports the same frame formats as the transmitter and can detect frame error, data overrun and parity errors.

11.12.2 Block Diagram

Figure 11.35 UART Block Diagram

11.12.3 Clock Generation

Figure 11.36 Clock Generation Block Diagram

The clock generation logic generates the base clock for the transmitter and receiver. The UART supports three modes of clock operation and those are asynchronous, master synchronous and slave synchronous mode. The UMSEL bit in UARTCR1 register selects asynchronous or synchronous operation. The MASTER bit in UARTCR3 register controls whether the clock source is internal (master mode, output pin) or external (slave mode, input pin). The ACK pin is active only when the UART operates in synchronous mode.

Following table shows the equations for calculating the baud rate (in bps).

Table 11-16 Equations for Calculating Baud Rate Register Setting

Operating Mode	Equation for Calculating Baud Rate
Asynchronous Normal Mode	$\text{Baud Rate} = \frac{f_x}{16(\text{UARTBD} + 1)}$
Synchronous Master Mode	$\text{Baud Rate} = \frac{f_x}{2(\text{UARTBD} + 1)}$

11.12.4 External Clock (ACK)

External clocking is used in the synchronous mode of operation.

External clock input from the ACK pin is sampled by a synchronization logic to remove meta-stability. The output from the synchronization logic must be passed through an edge detector before it is used by the transmitter and receiver. This process introduces two CPU clock period delay. The maximum frequency of the external ACK pin is limited up-to 1MHz.

11.12.5 Synchronous mode operation

When synchronous mode is used, the ACK pin will be used as either clock input (slave) or clock output (master). Data sampling and transmitter is issued on the different edge of ACK clock each other. For example, if data input on RXD pin is sampled on the rising edge of ACK clock, data output on TXD pin is altered on the falling edge.

The UCPOL bit in UARTCR1 register selects which ACK clock edge is used for data sampling and which is used for data change. As shown in the figure below, when UCPOL is zero, the data will be changed at rising ACK edge and sampled at falling ACK edge.

Figure 11.37 Synchronous Mode ACK Timing

11.12.6 Data format

A serial frame is defined to be one character of data bits with synchronization bits (start and stop bits), and optionally a parity bit for error detection.

The UART supports all 30 combinations of the following as valid frame formats.

- 1 start bit
- 5, 6, 7, 8 or 9 data bits
- no, even or odd parity bit
- 1 or 2 stop bits

A frame starts with the start bit followed by the least significant data bit (LSB). Then the next data bits, up to nine, are succeeding, ending with the most significant bit (MSB). If parity function is enabled, the parity bit is inserted between the last data bit and the stop bit. A high-to-low transition on data pin is considered as start bit. When a complete frame is transmitted, it can be directly followed by a new frame, or the communication line can be set to an idle state. The idle means high state of data pin. The following figure shows the possible combinations of the frame formats. Bits inside brackets are optional.

Figure 11.38 Frame Format

1 data frame consists of the following bits

- Idle No communication on communication line (Tx/D/RxD)
- St Start bit (Low)
- Dn Data bits (0~8)
- Parity bit ----- Even parity, Odd parity, No parity
- Stop bit(s) ----- 1 bit or 2 bits

The frame format used by the UART is set by the USIZE[2:0], UPM[1:0] and USBS bits in UARTCR1 and UARTCR3 register. The Transmitter and Receiver use the same setting.

11.12.7 Parity bit

The parity bit is calculated by doing an exclusive-OR of all the data bits. If odd parity is used, the result of the exclusive-O is inverted. The parity bit is located between the MSB and first stop bit of a serial frame.

$$P_{\text{even}} = D_{n-1} \wedge \dots \wedge D_3 \wedge D_2 \wedge D_1 \wedge D_0 \wedge 0$$

$$P_{\text{odd}} = D_{n-1} \wedge \dots \wedge D_3 \wedge D_2 \wedge D_1 \wedge D_0 \wedge 1$$

P_{even} : Parity bit using even parity

P_{odd} : Parity bit using odd parity

D_n : Data bit n of the character

11.12.8 UART Transmitter

The UART transmitter is enabled by setting the TXE bit in UARTCR2 register. When the Transmitter is enabled, the TXD pin should be set to TXD function for the serial output pin of UART by the PFSR6[7:6] or PFSR8[5:4]. The baud-rate, operation mode and frame format must be setup once before doing any transmission. In synchronous operation mode, the ACK pin is used as transmission clock, so it should be selected to do ACK function by PFSR6[5:4] or PFSR8[3:2].

11.12.8.1 Sending Tx data

A data transmission is initiated by loading the transmit buffer (UARTDR register I/O location) with the data to be transmitted. The data written in transmit buffer is moved to the shift register when the shift register is ready to send a new frame. The shift register is loaded with the new data if it is in idle state or immediately after the last stop bit of the previous frame is transmitted. When the shift register is loaded with new data, it will transfer one complete frame according to the settings of control registers. If the 9-bit characters are used in asynchronous or synchronous operation mode, the ninth bit must be written to the TX8 bit in UARTCR3 register before it is loaded to the transmit buffer (UARTDR register).

11.12.8.2 Transmitter flag and interrupt

The UART transmitter has 2 flags which indicate its state. One is UART data register empty flag (UDRE) and the other is transmit complete flag (TXC). Both flags can be interrupt sources.

UDRE flag indicates whether the transmit buffer is ready to receive new data. This bit is set when the transmit buffer is empty and cleared when the transmit buffer contains data to be transmitted but has not yet been moved into the shift register. And also this flag can be cleared by writing '0' to this bit position. Writing '1' to this bit position is prevented.

When the data register empty interrupt enable (UDRIE) bit in UARTCR2 register is set and the global interrupt is enabled, UARTST data register empty interrupt is generated while UDRE flag is set.

The transmit complete (TXC) flag bit is set when the entire frame in the transmit shift register has been shifted out and there is no more data in the transmit buffer. The TXC flag is automatically cleared when the transmit complete interrupt service routine is executed, or it can be cleared by writing '0' to TXC bit in UARTST register.

When the transmit complete interrupt enable (TXCIE) bit in UARTCR2 register is set and the global interrupt is enabled, UART transmit complete interrupt is generated while TXC flag is set.

11.12.8.3 Parity Generator

The parity generator calculates the parity bit for the serial frame data to be sent. When parity bit is enabled (UPM[1]=1), the transmitter control logic inserts the parity bit between the MSB and the first stop bit of the frame to be sent.

11.12.8.4 Disabling Transmitter

Disabling the transmitter by clearing the TXE bit will not become effective until ongoing transmission is completed. When the Transmitter is disabled, the TXD pin can be used as a normal general purpose I/O (GPIO).

11.12.9 UART Receiver

The UART receiver is enabled by setting the RXE bit in the UARTCR2 register. When the receiver is enabled, the RXD pin should be set to RXD function for the serial input pin of UART by PFSR7[1:0] or PFSR8[7:6]. The baud-rate, mode of operation and frame format must be set before serial reception. In synchronous operation mode the ACK pin is used as transfer clock, so it should be selected to do ACK function by PFSR6[5:4] or PFSR8[3:2].

11.12.9.1 Receiving Rx data

When UART is in synchronous or asynchronous operation mode, the receiver starts data reception when it detects a valid start bit (LOW) on RXD pin. Each bit after start bit is sampled at pre-defined baud-rate (asynchronous) or sampling edge of ACK (synchronous), and shifted into the receive shift register until the first stop bit of a frame is received. Even if there's 2nd stop bit in the frame, the 2nd stop bit is ignored by the receiver. That is, receiving the first stop bit means that a complete serial frame is present in the receiver shift register and contents of the shift register are to be moved into the receive buffer. The receive buffer is read by reading the UARTDR register.

If 9-bit characters are used (USIZE[2:0] = "111"), the ninth bit is stored in the RX8 bit position in the UARTCR3 register. The 9th bit must be read from the RX8 bit before reading the low 8 bits from the UARTDR register. Likewise, the error flags FE, DOR, PE must be read before reading the data from UARTDR register. It's because the error flags are stored in the same FIFO position of the receive buffer.

11.12.9.2 Receiver Flag and Interrupt

The UART receiver has one flag that indicates the receiver state.

The receive complete (RXC) flag indicates whether there are unread data in the receive buffer. This flag is set when there are unread data in the receive buffer and cleared when the receive buffer is empty. If the receiver is disabled (RXE=0), the receiver buffer is flushed and the RXC flag is cleared.

When the receive complete interrupt enable (RXCIE) bit in the UARTCR2 register is set and global interrupt is enabled, the UART receiver complete interrupt is generated while RXC flag is set.

The UART receiver has three error flags which are frame error (FE), data overrun (DOR) and parity error (PE). These error flags can be read from the UARTST register. As received data are stored in the 2-level receive buffer, these error flags are also stored in the same position of receive buffer. So, before reading received data from UARTDR register, read the UARTST register first which contains error flags.

The frame error (FE) flag indicates the state of the first stop bit. The FE flag is '0' when the stop bit was correctly detected as "1", and the FE flag is "1" when the stop bit was incorrect, i.e. detected as "0". This flag can be used for detecting out-of-sync conditions between data frames.

The data overrun (DOR) flag indicates data loss due to a receive buffer full condition. DOR occurs when the receive buffer is full, and another new data is present in the receive shift register which are to be stored into the receive buffer. After the DOR flag is set, all the incoming data are lost. To prevent data loss or clear this flag, read the receive buffer.

The parity error (PE) flag indicates that the frame in the receive buffer had a parity error when received. If parity check function is not enabled (UPM[1]=0), the PE bit is always read "0".

11.12.9.3 Parity Checker

If parity bit is enabled (UPM[1]=1), the Parity Checker calculates the parity of the data bits in incoming frame and compares the result with the parity bit from the received serial frame.

11.12.9.4 Disabling Receiver

In contrast to transmitter, disabling the Receiver by clearing RXE bit makes the Receiver inactive immediately. When the receiver is disabled, the receiver flushes the receive buffer, the remaining data in the buffer is all reset, and the RXD pin can be used as a normal general purpose I/O (GPIO).

11.12.9.5 Asynchronous Data Reception

To receive asynchronous data frame, the UART includes a clock and data recovery unit. The clock recovery logic is used for synchronizing the internally generated baud-rate clock to the incoming asynchronous serial frame on the RXD pin.

The data recovery logic samples and low pass filters the incoming bits, and this removes the noise of RXD pin.

The next figure illustrates the sampling process of the start bit of an incoming frame. The sampling rate is 16 times of the baud-rate in normal mode. The horizontal arrows show the synchronization variation due to the asynchronous sampling process.

Figure 11.39 Start Bit Sampling

When the receiver is enabled (RXE=1), the clock recovery logic tries to find a high-to-low transition on the RXD line, the start bit condition. After detecting high to low transition on RXD line, the clock recovery logic uses samples 8,9, and 10 for normal mode to decide if a valid start bit is received. If more than 2 samples have logical low level, it is considered that a valid start bit is detected and the internally generated clock is synchronized to the incoming data frame. And the data recovery can begin. The synchronization process is repeated for each start bit.

As described above, when the receiver clock is synchronized to the start bit, the data recovery can begin. Data recovery process is almost similar to the clock recovery process. The data recovery logic samples 16 times for each incoming bits, and uses sample 8, 9, and 10 to decide data value. If more than 2 samples have low levels, the received bit is considered to a logic '0' and if more than 2 samples have high levels, the received bit is considered to a logic '1'. The data recovery process is then repeated until a complete frame is received including the first stop bit. The decided bit value is stored in the receive shift register in order. Note that the Receiver only uses the first stop bit of a frame. Internally, after receiving the first stop bit, the Receiver is in idle state and waiting to find start bit.

Figure 11.40 Sampling of Data and Parity Bit

The process for detecting stop bit is like clock and data recovery process. That is, if 2 or more samples of 3 center values have high level, correct stop bit is detected, else a frame error (FE) flag is set. After deciding whether the first stop bit is valid or not, the Receiver goes to idle state and monitors the RXD line to check a valid high to low transition is detected (start bit detection).

Figure 11.41 Stop Bit Sampling and Next Start Bit Sampling

11.12.10 Register Map

Table 11-17 UART Register Map

Name	Address	Dir	Default	Description
UARTBD	E6H	R/W	FFH	UART Baud Rate Generation Register
UARTDR	E7H	R/W	00H	UART Data Register
UARTCR1	E2H	R/W	00H	UART Control Register 1

UARTCR3	E4H	R/W	00H	UART Control Register 3
UARTST	E5H	R/W	80H	UART Status Register

11.12.11 UART Register Description

UART module consists of UART baud rate generation register (UARTBD), UART data register (UARTDR), UART control register 1 (UARTCR1), UART control register 2 (UARTCR2), UART control register 3 (UARTCR3), and UART status register (UARTST).

11.12.12 Register Description for UART

UARTBD (UART Baud Rate Generation Register) : E6H

7	6	5	4	3	2	1	0
UARTBD7	UARTBD6	UARTBD5	UARTBD4	UARTBD3	UARTBD2	UARTBD1	UARTBD0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Initial value : FFH

UARTBD [7:0] The value in this register is used to generate internal baud rate in asynchronous mode. To prevent malfunction, do not write '0' in asynchronous mode.

UARTDR (UART Data Register) : E7H

7	6	5	4	3	2	1	0
UARTDR7	UARTDR6	UARTDR5	UARTDR4	UARTDR3	UARTDR2	UARTDR1	UARTDR0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Initial value : 00H

UARTDR [7:0] The UART Transmit Buffer and Receive Buffer share the same I/O address with this DATA register. The Transmit Data Buffer is the destination for data written to the UARTDR register. Reading the UDATA register returns the contents of the Receive Buffer. Write this register only when the UDRE flag is set.

UARTCR1 (UART Control Register 1) : E2H

7	6	5	4	3	2	1	0
–	UMSEL	UPM1	UPM0	USIZE2	USIZE1	USIZE0	UCPOL
–	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Initial value : 00H

UMSEL Selects Operation Mode of UART

- 0 Asynchronous Mode
- 1 Synchronous Mode

UPM[1:0] Selects Parity Generation and Check methods

- | UPM1 | UPM0 | Parity |
|------|------|-------------|
| 0 | 0 | No Parity |
| 0 | 1 | Reserved |
| 1 | 0 | Even Parity |
| 1 | 1 | Odd Parity |

USIZE[2:0] Selects the Length of Data Bits in Frame

- | USIZE2 | USIZE1 | USIZE0 | Data Length |
|--------|--------|--------|-------------|
| 0 | 0 | 0 | 5 bit |
| 0 | 0 | 1 | 6 bit |
| 0 | 1 | 0 | 7 bit |
| 0 | 1 | 1 | 8 bit |
| 1 | 0 | 0 | Reserved |
| 1 | 0 | 1 | Reserved |
| 1 | 1 | 0 | Reserved |
| 1 | 1 | 1 | 9 bit |

UCPOL Selects Polarity of ACK in Synchronous Mode

- 0 TXD change @Rising Edge, RXD change @Falling Edge
- 1 TXD change @Falling Edge, RXD change @Rising Edge

UARTCR2 (UART Control Register 2) : E3H

7	6	5	4	3	2	1	0
UDRIE	TXCIE	RXCIE	WAKEIE	TXE	RXE	UARTEN	U2X
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Initial value : 00H

UDRIE	Interrupt enable bit for UART Data Register Empty 0 Interrupt from UDRE is inhibited (use polling) 1 When UDRE is set, request an interrupt
TXCIE	Interrupt enable bit for Transmit Complete 0 Interrupt from TXC is inhibited (use polling) 1 When TXC is set, request an interrupt
RXCIE	Interrupt enable bit for Receive Complete 0 Interrupt from RXC is inhibited (use polling) 1 When RXC is set, request an interrupt
WAKEIE	Interrupt enable bit for Asynchronous Wake in STOP mode. When device is in stop mode, if RXD goes to LOW level an interrupt can be requested to wake-up system. At that time the UDRIE bit and UARTST register value should be set to '0b' and "00H", respectively. 0 Interrupt from Wake is inhibited 1 When WAKE is set, request an interrupt
TXE	Enables the transmitter unit 0 Transmitter is disabled 1 Transmitter is enabled
RXE	Enables the receiver unit 0 Receiver is disabled 1 Receiver is enabled
UARTEN	Activate UART module by supplying clock. When one of TXE and RXE values is "1", the UARTEN bit always set to "1". 0 USART is disabled (clock is halted) 1 USART is enabled
U2X	This bit only has effect for the asynchronous operation and selects receiver sampling rate. 0 Normal asynchronous operation 1 Double Speed asynchronous operation

UARTCR3 (UART Control Register 3) : E4H

7	6	5	4	3	2	1	0
MASTER	LOOPS	DISACK	–	–	USBS	TX8	RX8
RW	RW	RW	–	–	RW	RW	R

Initial value : 00H

- MASTER** Selects master or slave in Synchronous mode operation and controls the direction of ACK pin
- 0 Slave mode operation and ACK is input pin.
 - 1 Master mode operation and ACK is output pin
- LOOPS** Controls the Loop Back Mode of UART, for test mode
- 0 Normal operation
 - 1 Loop Back mode
- DISACK** In Synchronous mode of operation, selects the waveform of ACK output
- 0 ACK is free-running while UART is enabled in synchronous master mode
 - 1 ACK is active while any frame is on transferring
- USBS** Selects the length of stop bit.
- 0 1 Stop Bit
 - 1 2 Stop Bit
- TX8** The ninth bit of data frame in UART. Write this bit first before loading the UARTDR register
- 0 MSB (9th bit) to be transmitted is '0'
 - 1 MSB (9th bit) to be transmitted is '1'
- RX8** The ninth bit of data frame in UART. Read this bit first before reading the receive buffer
- 0 MSB (9th bit) received is '0'
 - 1 MSB (9th bit) received is '1'

UARTST (UART Status Register) : E5H

7	6	5	4	3	2	1	0
UDRE	TXC	RXC	WAKE	SOFTTRST	DOR	FE	PE
RW	RW	R	RW	RW	R	RW	RW

Initial value : 80H

UDRE	The UDRE flag indicates if the transmit buffer (UARTDR) is ready to receive new data. If UDRE is '1', the buffer is empty and ready to be written. This flag can generate a UDRE interrupt. 0 Transmit buffer is not empty. 1 Transmit buffer is empty.
TXC	This flag is set when the entire frame in the transmit shift register has been shifted out and there is no new data currently present in the transmit buffer. This flag is automatically cleared when the interrupt service routine of a TXC interrupt is executed. This flag can generate a TXC interrupt. This bit is automatically cleared. 0 Transmission is ongoing. 1 Transmit buffer is empty and the data in transmit shift register are shifted out completely.
RXC	This flag is set when there are unread data in the receive buffer and cleared when all the data in the receive buffer are read. The RXC flag can be used to generate a RXC interrupt. 0 There is no data unread in the receive buffer 1 There are more than 1 data in the receive buffer
WAKE	This flag is set when the RX pin is detected low while the CPU is in stop mode. This flag can be used to generate a WAKE interrupt. This bit is set only when in asynchronous mode of operation. This bit should be cleared by program software. 0 No WAKE interrupt is generated. 1 WAKE interrupt is generated
SOFTTRST	This is an internal reset and only has effect on UART. Writing '1' to this bit initializes the internal logic of UART and this bit is automatically cleared. 0 No operation 1 Reset UART
DOR	This bit is set if a Data OverRun occurs. While this bit is set, the incoming data frame is ignored. This flag is valid until the receive buffer is read. 0 No Data OverRun 1 Data OverRun detected
FE	This bit is set if the first stop bit of next character in the receive buffer is detected as '0'. This bit is valid until the receive buffer is read. 0 No Frame Error 1 Frame Error detected
PE	This bit is set if the next character in the receive buffer has a Parity Error to be received while Parity Checking is enabled. This bit is valid until the receive buffer is read. 0 No Parity Error 1 Parity Error detected

11.13 LCD Driver

11.13.1 Overview

The LCD driver is controlled by the LCD Control Register (LCDCRH/L). The LCLK[1:0] determines the frequency of COM signal scanning of each segment output. A RESET clears the LCD control register LCDCRH and LCDCRL values to logic '0'.

The LCD display can continue operating during IDLE and STOP modes if a sub-frequency clock is used as system clock source.

The clock and duty for LCD driver is automatically initialized by hardware, whenever LCDCRH register data value is rewritten. So, don't rewrite LCDCRH frequently.

11.13.2 LCD Display RAM Organization

Display data are stored to the display data area in the external data memory.

The display data which stored to the display external data area (address 0000H-0027H) are read automatically and sent to the LCD driver by the hardware. The LCD driver generates the segment signals and common signals in accordance with the display data and drive method. Therefore, display patterns can be changed by only overwriting the contents of the display external data area with a program.

Figure 11-41 shows the correspondence between the display external data area and the COM/SEG pins. The LCD is turned on when the display data is "1" and turned off when "0".

12. Power Down Operation

12.1 Overview

The Z51F3221 MCU features two power-down modes to minimize the power consumption of the device. In power down mode, power consumption is reduced considerably. The device provides three kinds of power saving functions, Main-IDLE, Sub-IDLE and STOP mode. In three modes, program is stopped.

12.2 Peripheral Operation in IDLE/STOP Mode

Table 12-1 Peripheral Operation during Power Down Mode

Peripheral	IDLE Mode	STOP Mode
CPU	ALL CPU Operation are Disable	ALL CPU Operation are Disable
RAM	Retain	Retain
Basic Interval Timer	Operates Continuously	Stop
Watch Dog Timer	Operates Continuously	Stop (Can be operated with WDTRC OSC)
Watch Timer	Operates Continuously	Stop (Can be operated with sub clock)
Timer0~3	Operates Continuously	Halted (Only when the Event Counter Mode is Enabled, Timer operates Normally)
ADC	Operates Continuously	Stop
BUZ	Operates Continuously	Stop
SIO	Operates Continuously	Only operate with external clock
UART	Operates Continuously	Stop
LCD Controller	Operates Continuously	Stop (Can be operated with sub clock)
Internal OSC (8MHz)	Oscillation	Stop when the system clock (fx) is f _{IRC}
WDTRC OSC (6kHz)	Stop	Can be operated with setting value
Main OSC (1~12MHz)	Oscillation	Stop when fx = f _{XIN}
Sub OSC (32.768kHz)	Oscillation	Stop when fx = f _{SUB}
I/O Port	Retain	Retain
Control Register	Retain	Retain
Address Data Bus	Retain	Retain
Release Method	By RESET, all Interrupts	By RESET, Timer Interrupt (EC0,EC3), SIO (External clock), External Interrupt, UART by ACK, WT (sub clock), WDT

12.3 IDLE Mode

The power control register is set to '01h' to enter the IDLE Mode. In this mode, the internal oscillation circuits remain active. Oscillation continues and peripherals are operated normally but CPU stops. It is released by reset or interrupt. To be released by interrupt, interrupt should be enabled before IDLE mode. If using reset, because the device becomes initialized state, the registers have reset value.

Figure 12.1 IDLE Mode Release Timing by External Interrupt

12.4 STOP Mode

The power control register is set to '03H' to enter the STOP Mode. In the stop mode, the selected oscillator, system clock and peripheral clock is stopped, but watch timer can be continued to operate with sub clock. With the clock frozen, all functions are stopped, but the on-chip RAM and control registers are held. For example, If the internal RC oscillator (f_{IRC}) is selected for the system clock and the sub clock (f_{SUB}) is oscillated, the internal RC oscillator stops oscillation and the sub clock is continuously oscillated in stop mode. At that time, the watch timer and LCD controller can be operated with the sub clock.

The source for exit from STOP mode is hardware reset and interrupts. The reset re-defines all the control registers.

When exit from STOP mode, enough oscillation stabilization time is required to normal operation. Figure 12.2 shows the timing diagram. When released from STOP mode, the Basic interval timer is activated on wake-up. Therefore, before STOP instruction, user must be set its relevant prescale divide ratio to have long enough time. This guarantees that oscillator has started and stabilized.

Figure 12.2 STOP Mode Release Timing by External Interrupt

12.5 Release Operation of STOP Mode

After STOP mode is released, the operation begins according to content of related interrupt register just before STOP mode start (Figure 12.3). If the global interrupt Enable Flag (IE.EA) is set to '1', the STOP mode is released by the interrupt which each interrupt enable flag = '1' and the CPU jumps to the relevant interrupt service routine. Even if the IE.EA bit is cleared to '0', the STOP mode is released by the interrupt of which the interrupt enable flag is set to '1'.

Figure 12.3 STOP Mode Release Flow

13. RESET

13.1 Overview

The following is the hardware setting value.

Table 13-1 Reset State

On Chip Hardware	Initial Value
Program Counter (PC)	0000h
Accumulator	00h
Stack Pointer (SP)	07h
Peripheral Clock	On
Control Register	Refer to the Peripheral Registers

13.2 Reset Source

The Z51F3221 MCU features five types of reset sources. The following is the reset sources.

- External RESETB
- Power ON RESET (POR)
- WDT Overflow Reset (In the case of WDTEN = '1')
- Low Voltage Reset (In the case of LVREN = '0')
- OCD Reset

13.3 RESET Block Diagram

Figure 13.1 RESET Block Diagram

13.4 RESET Noise Canceller

The Figure 13.2 is the noise canceller diagram for noise cancellation of RESET. It has the noise cancellation value of about 2 μ s (@V_{DD}=5V) to the low input of system reset.

Figure 13.2 Reset noise canceller timer diagram

13.5 Power On RESET

When rising device power, the POR (Power On Reset) has a function to reset the device. If POR is used, it executes the device RESET function instead of the RESET IC or the RESET circuits.

Figure 13.3 Fast VDD Rising Time

Figure 13.4 Internal RESET Release Timing On Power-Up

Figure 13.5 Configuration Timing when Power-on

Figure 13.6 Boot Process WaveForm

Table 13-2 Boot Process Description

Process	Description	Remarks
①	-No Operation	
②	-1st POR level Detection	-about 1.4V
③	- (INT-OSC 8MHz/8)x256x28h Delay section (=10ms) -VDD input voltage must rise over than flash operating voltage for Config read	-Slew Rate $\geq 0.15V/ms$
④	- Config read point	-about 1.5V ~ 1.6V -Config Value is determined by Writing Option
⑤	- Rising section to Reset Release Level	-16ms point after POR or Ext_reset release
⑥	- Reset Release section (BIT overflow) i) after16ms, after External Reset Release (External reset) ii) 16ms point after POR (POR only)	- BIT is used for Peripheral stability
⑦	-Normal operation	

13.6 External RESETB Input

The External RESETB is the input to a Schmitt trigger. If RESETB pin is held with low for at least 10us over within the operating voltage range and stable oscillation, it is applied and the internal state is initialized. After reset state becomes '1', it needs the stabilization time with 16ms and after the stable state, the internal RESET becomes '1'. The Reset process step needs 5 oscillator clocks. And the program execution starts at the vector address stored at address 0000H.

Figure 13.7 Timing Diagram after RESET

Figure 13.8 Oscillator generating waveform example

NOTE) As shown Figure 13.8, the stable generating time is not included in the start-up time.

The RESETB pin has a Pull-up register by H/W.

13.7 Brown Out Detector Processor

The Z51F3221 MCU features an On-chip brown-out detection circuit (BOD) for monitoring the VDD level during operation by comparing it to a fixed trigger level. The trigger level for the BOD can be selected by LVRVS[3:0] bit to be 1.60V, 2.00V, 2.10V, 2.20V, 2.32V, 2.44V, 2.59V, 2.75V, 2.93V, 3.14V, 3.38V, 3.67V, 4.00V, 4.40V. In the STOP mode, this will contribute significantly to the total current consumption. So to minimize the current consumption, the LVREN bit is set to off by software.

Table 13-3 Reset Operation Register Map

Name	Address	Dir	Default	Description
RSTFR	86H	R/W	88H	Reset Flag Register
LVRCCR	F7H	R/W	00H	Low Voltage Reset Control Register
LVICR	E1H	R/W	00H	Low Voltage Indicator Control Register

13.8.2 Reset Operation Register Description

The reset control register consists of the reset flag register (RSTFR), low voltage reset control register (LVRCCR), and low voltage indicator control register (LVICR).

13.8.3 Register Description for Reset Operation

RSTFR (Reset Flag Register) : 86H

7	6	5	4	3	2	1	0
PORF	EXTRF	WDTRF	OCDRF	LVRF	—	—	—
RW	RW	RW	RW	RW	—	—	—

Initial value : 88H

PORF	Power-On Reset flag bit. The bit is reset by writing '0' to this bit. 0 No detection 1 Detection
EXTRF	External Reset (RESETB) flag bit. The bit is reset by writing '0' to this bit or by Power-On Reset. 0 No detection 1 Detection
WDTRF	Watch Dog Reset flag bit. The bit is reset by writing '0' to this bit or by Power-On Reset. 0 No detection 1 Detection
OCDRF	On-Chip Debug Reset flag bit. The bit is reset by writing '0' to this bit or by Power-On Reset. 0 No detection 1 Detection
LVRF	Low Voltage Reset flag bit. The bit is reset by writing '0' to this bit or by Power-On Reset. 0 No detection 1 Detection

- NOTES) 1. When the Power-On Reset occurs, the PORF and LVRF bits are only set to "1", the other flag (WDTRF and OCDRF) bits are all cleared to "0".
2. When the Power-On Reset occurs, the EXTRF bit is unknown, At that time, the EXTRF bit can be set to "1" when External Reset (RESETB) occurs.
3. When a reset except the POR occurs, the corresponding flag bit is only set to "1", the other flag bits are kept in the previous values.

LVRCCR (Low Voltage Reset Control Register) : F7H

7	6	5	4	3	2	1	0
LVRST	–	–	LVRVS3	LVRVS2	LVRVS1	LVRVS0	LVREN
R/W	–	–	R/W	R/W	R/W	R/W	R/W

Initial value : 00H

LVRST LVR Enable when Stop Release
0 Not effect at stop release
1 LVR enable at stop release

NOTES)

- When this bit is '1', the LVREN bit is cleared to '0' by stop mode to release. (LVR enable)
- When this bit is '0', the LVREN bit is not effect by stop mode to release.

LVRVS[3:0] LVR Voltage Select

LVRVS3	LVRVS2	LVRVS1	LVRVS0	Description

14. On-chip Debug System

14.1 Overview

14.1.1 Description

On-chip debug system (OCD) of the Z51F3221 MCU can be used for programming the non-volatile memories and on-chip debugging. Detail descriptions for programming via the OCD interface can be found in the following chapter.

Figure 14.1 shows a block diagram of the OCD interface and the On-chip Debug system.

14.1.2 Feature

- Two-wire external interface: 1-wire serial clock input, 1-wire bi-directional serial data bus
- Debugger Access to:
 - All Internal Peripheral Units
 - Internal data RAM
 - Program Counter
 - Flash and Data EEPROM Memories
- Extensive On-chip Debug Support for Break Conditions, Including
 - Break Instruction
 - Single Step Break
 - Program Memory Break Points on Single Address
 - Programming of Flash, EEPROM, Fuses, and Lock Bits through the two-wire Interface
 - On-chip Debugging Supported by Dr.Choice®
- Operating frequency
 - Supports the maximum frequency of the target MCU

Figure 14.1 Block Diagram of On-Chip Debug System

14.2 Two-Pin External Interface

14.2.1 Basic Transmission Packet

- 10-bit packet transmission using two-pin interface.
- 1-packet consists of 8-bit data, 1-bit parity and 1-bit acknowledge.
- Parity is even of '1' for 8-bit data in transmitter.
- Receiver generates acknowledge bit as '0' when transmission for 8-bit data and its parity has no error.
- When transmitter has no acknowledge (Acknowledge bit is '1' at tenth clock), error process is executed in transmitter.
- When acknowledge error is generated, host PC makes stop condition and transmits command which has error again.
- Background debugger command is composed of a bundle of packet.
- Start condition and stop condition notify the start and the stop of background debugger command respectively.

15. Flash Memory

15.1 Overview

15.1.1 Description

The Z51F3221 MCU incorporates flash memory to which a program can be written, erased, and overwritten while mounted on the board. The flash memory can be read by 'MOVC' instruction and it can be programmed in OCD, serial ISP mode or user program mode.

- Flash Size : 32kbytes
- Single power supply program and erase
- Command interface for fast program and erase operation
- Up to 100,000 program/erase cycles at typical voltage and temperature for flash memory

15.1.2 Flash Program ROM Structure

Figure 15.1 Flash Program ROM Structure

15.1.3 Register Map

Table 15-1Flash Memory Register Map

Name	Address	Dir	Default	Description
FSADRH	FAH	R/W	00H	Flash Sector Address High Register
FSADRM	FBH	R/W	00H	Flash Sector Address Middle Register
FSADRL	FCH	R/W	00H	Flash Sector Address Low Register
FIDR	FDH	R/W	00H	Flash Identification Register
FMCR	FEH	R/W	00H	Flash Mode Control Register

15.1.4 Register Description for Flash Memory Control and Status

Flash control register consists of the flash sector address high register (FSADRH), flash sector address middle register (FSADRM), flash sector address low register (FSADRL), flash identification register (FIDR), and flash mode control register (FMCR). They are mapped to SFR area and can be accessed only in programming mode.

15.1.5 Register Description for Flash

FSADRH (Flash Sector Address High Register) : FAH

7	6	5	4	3	2	1	0
–	–	–	–	FSADRH3	FSADRH2	FSADRH1	FSADRH0
–	–	–	–	RW	RW	RW	RW

Initial value : 00H

FSADRH[3:0] Flash Sector Address High

FSADRM (Flash Sector Address Middle Register) : FBH

7	6	5	4	3	2	1	0
FSADRM7	FSADRM6	FSADRM5	FSADRM4	FSADRM3	FSADRM2	FSADRM1	FSADRM0
RW	RW	RW	RW	RW	RW	RW	RW

Initial value : 00H

FSADRM[7:0] Flash Sector Address Middle

FSADRL (Flash Sector Address Low Register) : FCH

7	6	5	4	3	2	1	0
FSADRL7	FSADRL6	FSADRL5	FSADRL4	FSADRL3	FSADRL2	FSADRL1	FSADRL0
RW	RW	RW	RW	RW	RW	RW	RW

Initial value : 00H

FSADRL[7:0] Flash Sector Address Low

FIDR (Flash Identification Register) : FDH

7	6	5	4	3	2	1	0
FIDR7	FIDR6	FIDR5	FIDR4	FIDR3	FIDR2	FIDR1	FIDR0
RW	RW	RW	RW	RW	RW	RW	RW

Initial value : 00H

FIDR[7:0] Flash Identification

Others No identification value

10100101 Identification value for a flash mode

(These bits are automatically cleared to logic '00H' immediately after one time operation)

FMCR (Flash Mode Control Register) : FEH

7	6	5	4	3	2	1	0
FMBUSY	–	–	–	–	FMCR2	FMCR1	FMCR0
R	–	–	–	–	RW	RW	RW

Initial value : 00H

FMBUSY Flash Mode Busy Bit. This bit will be used for only debugger.

0 No effect when “1” is written

1 Busy

FMCR[2:0] Flash Mode Control Bits. During a flash mode operation, the CPU is hold and the global interrupt is on disable state regardless of the IE.7 (EA) bit.

FMCR2 FMCR1 FMCR0 Description

0 0 1 Select flash page buffer reset mode and start regardless of the FIDR value (Clear all 64bytes to '0')

0 1 0 Select flash sector erase mode and start operation when the FIDR="10100101b'

0 1 1 Select flash sector write mode and start operation when the FIDR="10100101b'

1 0 0 Select flash sector hard lock and start operation when the FIDR="10100101b'

Others Values: No operation

(These bits are automatically cleared to logic '00H' immediately after one time operation)

15.1.6 Serial In-System Program (ISP) Mode

Serial in-system program uses the interface of debugger which uses two wires. Refer to chapter 14 in details about debugger

15.1.7 Protection Area (User program mode)

The Z51F3221 MCU can program its own flash memory (protection area). The protection area can not be erased or programmed. The protection areas are available only when the PAEN bit is cleared to '0', that is, enable protection area at the configure option 2 if it is needed. If the protection area isn't enabled (PAEN = '1'), this area can be used as a normal program memory.

The size of protection area can be varied by setting of configure option 2.

Table 15-2 Protection Area size

Protection Area Size Select		Size of Protection Area	Address of Protection Area
PASS1	PASS0		
0	0	3.8k Bytes	0100H – 0FFFH
0	1	1.7k Bytes	0100H – 07FFH
1	0	768 Bytes	0100H – 03FFH
1	1	256 Bytes	0100H – 01FFH

NOTE) Refer to chapter 16 in configure option control.

15.1.8 Erase Mode

The sector erase program procedure in user program mode

1. Page buffer clear (FMCR=0x01)
2. Write '0' to page buffer
3. Set flash sector address register (FSADRH/FSADRM/FSADRL).
4. Set flash identification register (FIDR).
5. Set flash mode control register (FMCR).
6. Erase verify

Program Tip – sector erase

```

MOV    FMCR,#0x01      ;page buffer clear

1	1	256 Bytes (Address 0100H – 01FFFH)	

17. APPENDIX

A. Instruction Table

Instructions are either 1, 2 or 3 bytes long as listed in the 'Bytes' column below.

Each instruction takes either 1, 2 or 4 machine cycles to execute as listed in the following table. 1 machine cycle comprises 2 system clock cycles.

ARITHMETIC				
Mnemonic	Description	Bytes	Cycles	Hex code
ADD A,Rn	Add register to A	1	1	28-2F
ADD A,dir	Add direct byte to A	2	1	25
ADD A,@Ri	Add indirect memory to A	1	1	26-27
ADD A,#data	Add immediate to A	2	1	24
ADDC A,Rn	Add register to A with carry	1	1	38-3F
ADDC A,dir	Add direct byte to A with carry	2	1	35
ADDC A,@Ri	Add indirect memory to A with carry	1	1	36-37

CJNE Rn,#d,rel	Compare register, immediate jne relative	3	2	B8-BF
CJNE @Ri,#d,rel	Compare indirect, immediate jne relative	3	2	B6-B7
DJNZ Rn,rel	Decrement register, jnz relative	3	2	D8-DF
DJNZ dir,rel	Decrement direct byte, jnz relative	3	2	D5

MISCELLANEOUS				
Mnemonic	Description	Bytes	Cycles	Hex code
NOP	No operation	1	1	00

ADDITIONAL INSTRUCTIONS (selected through EO[7:4])				
Mnemonic	Description	Bytes	Cycles	Hex code
MOVC @(DPTR++),A	M8051W/M8051EW-specific instruction supporting software download into program memory	1	2	A5
TRAP	Software break command	1	1	A5

In the above table, an entry such as E8-EF indicates a continuous block of hex opcodes used for 8 different registers, the register numbers of which are defined by the lowest three bits of the corresponding code. Non-continuous blocks of codes, shown as 11→F1 (for example), are used for absolute jumps and calls, with the top 3 bits of the code being used to store the top three bits of the destination address.

The CJNE instructions use the abbreviation #d for immediate data; other instructions use #data.

B. Instructions on how to use the input port.

- Error occur status
 - Using compare jump instructions with input port, it could cause error due to the timing conflict inside the MCU.
 - Compare jump Instructions which cause potential error used with input port condition:

```
JB    bit, rel    ; jump on direct bit=1
JNB   bit, rel    ; jump on direct bit=0
JBC   bit, rel    ; jump on direct bit=1 and clear
CJNE  A, dir, rel ; compare A, direct jne relative
DJNZ  dir, rel    ; decrement direct byte, jnz relative
```

- It is only related with Input port. Internal parameters, SFRs and output bit ports don't cause any error by using compare jump instructions.
- If input signal is fixed, there is no error in using compare jump instructions.

- Error status example

```
while(1){
    if (P00==1){ P10=1; }
    else { P10=0; }
    P11^=1;
}
```

```
zzz:  JNB    080.0, xxx ; it possible to be error
      SETB   088.0
      SJMP   yyy
xxx:   CLR    088.0
yyy:   MOV    C,088.1
      CPL    C
      MOV    088.1,C
      SJMP   zzz
```

```
unsigned char ret_bit_err(void)
{
    return !P00;
}
```

```
MOV    R7, #000
JB      080.0, xxx ; it possible to be error
MOV    R7, #001
xxx:   RET
```

- Preventative measures (2 cases)
 - Do not use input bit port for bit operation but for byte operation. Using byte operation instead of bit operation will not cause any error in using compare jump instructions for input port.

```
while(1){
    if ((P0&0x01)==0x01){ P10=1; }
    else { P10=0; }
    P11^=1;
}
```

```
zzz:  MOV     A, 080    ; read as byte
      JNB     0E0.0, xxx ; compare
      SETB    088.0
      SJMP    yyy
xxx:   CLR     088.0
yyy:   MOV     C,088.1
      CPL     C
      MOV     088.1,C
      SJMP    zzz
```

- If you use input bit port for compare jump instruction, you have to copy the input port as internal parameter or carry bit and then use compare jump instruction.

```
bit tt;
while(1){
    tt=P00;
    if (tt==0){ P10=1;}
    else {P10=0;}
    P11^=1;
}
```

```
zzz:  MOV    C,080.0 ; input port use internal parameter
      MOV    020.0, C    ; move
      JB     020.0, xxx   ; compare
      SETB   088.0
      SJMP   yyy
xxx:   CLR    088.0
yyy:   MOV    C,088.1
      CPL    C
      MOV    088.1,C
      SJMP   zzz
```
