

PCA9554B; PCA9554C

Low-voltage 8-bit I²C-bus and SMBus low power I/O port with interrupt, weak pull-up

Rev. 1 — 19 September 2012

Product data sheet

1. General description

The PCA9554B and PCA9554C are low-voltage 8-bit General Purpose Input/Output (GPIO) expanders with interrupt for I²C-bus/SMBus applications. The only difference between the PCA9554B and PCA9554C is their I²C fixed address allowing a larger number of the same device on the I²C-bus with no chance of address conflict. NXP I/O expanders provide a simple solution when additional I/Os are needed while keeping interconnections to a minimum, for example, in ACPI power switches, sensors, push buttons, LEDs, fan control, etc.

In addition to providing a flexible set of GPIOs, the wide V_{DD} range of 1.65 V to 5.5 V allow the PCA9554B/PCA9554C to interface with next-generation microprocessors and microcontrollers where supply levels are dropping down to conserve power.

The PCA9554B/PCA9554C contain a register set of 8-bit Configuration, Input, Output, and Polarity Inversion registers.

The PCA9554B is a pin-to-pin replacement for the PCA9554, while the PCA9554C replaces the PCA9554A. Both of these devices replace other industry-standard part numbers. More fully-featured parts PCAL9554B and PCAL9554C are also available with Agile I/O features. See the respective data sheet for more details.

The PCA9554B/PCA9554C open-drain interrupt (\overline{INT}) output is activated when any input state differs from its corresponding Input Port register state and is used to indicate to the system master that an input state has changed.

\overline{INT} can be connected to the interrupt input of a microcontroller. By sending an interrupt signal on this line, the remote I/O can inform the microcontroller if there is incoming data on its ports without having to communicate via the I²C-bus. Thus, the PCA9554B/PCA9554C can remain a simple slave device.

The device outputs have 25 mA sink capabilities for directly driving LEDs while consuming low device current.

The power-on reset sets the registers to their default values and initializes the device state machine.

Three hardware pins (A0, A1, A2) select the fixed I²C-bus address and allow up to eight devices to share the same I²C-bus/SMBus. The PCA9554B and PCA9554C differ only in their base I²C-bus addresses permitting a total of 16 devices on the I²C-bus, minimizing the chance for address conflict, even in the most complex system.

2. Features and benefits

- I²C-bus to parallel port expander
- Operating power supply voltage range of 1.65 V to 5.5 V
- Low standby current consumption:
 - ◆ 1.5 μ A (typical at 5 V V_{DD})
 - ◆ 1.0 μ A (typical at 3.3 V V_{DD})
- Schmitt-trigger action allows slow input transition and better switching noise immunity at the SCL and SDA inputs
 - ◆ $V_{hys} = 0.10 \times V_{DD}$ (typical)
- 5 V tolerant I/Os
- Open-drain active LOW interrupt output (\overline{INT})
- 400 kHz Fast-mode I²C-bus
- Input/output configuration register
- Polarity inversion register
- Internal power-on reset
- Power-up with all channels configured as inputs
- No glitch on power-up
- Latched outputs with 25 mA drive maximum capability for directly driving LEDs
- Latch-up performance exceeds 100 mA per JESD78, Class II
- ESD protection exceeds JESD22
 - ◆ 2000 V Human Body Model (A114-A)
 - ◆ 1000 V Charged-Device Model (C101)
- Packages offered: TSSOP16 and HVQFN16

3. Ordering information

Table 1. Ordering information

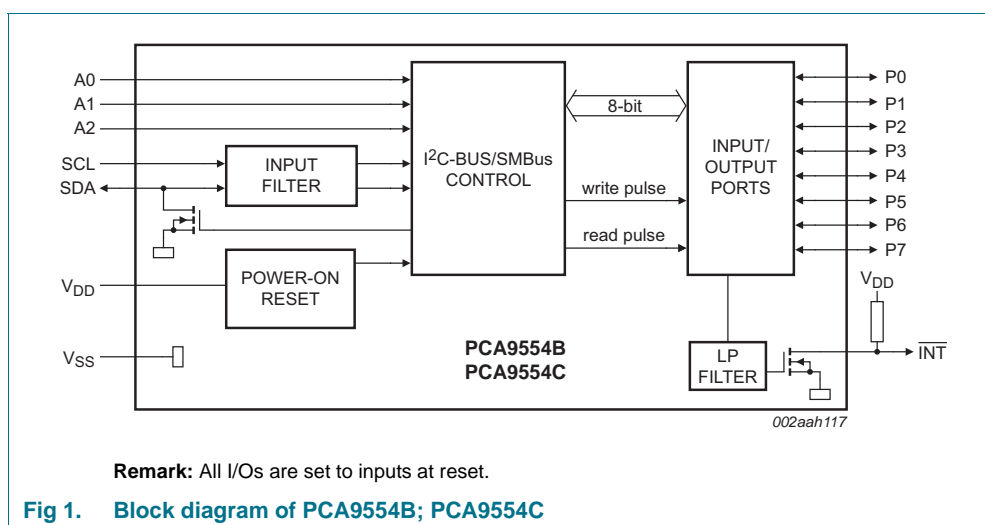

Type number	Topside mark	Package		Version
		Name	Description	
PCA9554BBS	P4B	HVQFN16	plastic thermal enhanced very thin quad flat package; no leads; 16 terminals; body 3 × 3 × 0.85 mm	SOT758-1
PCA9554BPW	PA9554B	TSSOP16	plastic thin shrink small outline package; 16 leads; body width 4.4 mm	SOT403-1
PCA9554CBS	P4C	HVQFN16	plastic thermal enhanced very thin quad flat package; no leads; 16 terminals; body 3 × 3 × 0.85 mm	SOT758-1
PCA9554CPW	PA9554C	TSSOP16	plastic thin shrink small outline package; 16 leads; body width 4.4 mm	SOT403-1

3.1 Ordering options

Table 2. Ordering options

Type number	Orderable part number	Package	Packing method	Minimum order quantity	Temperature range
PCA9554BBS	PCA9554BBSHP	HVQFN16	Reel pack, SMD, 13-inch, Turned	6000	T _{amb} = -40 °C to +85 °C
PCA9554BPW	PCA9554BPWJ	TSSOP16	Reel pack, SMD, 13-inch	2500	T _{amb} = -40 °C to +85 °C
PCA9554CBS	PCA9554CBSHP	HVQFN16	Reel pack, SMD, 13-inch, Turned	6000	T _{amb} = -40 °C to +85 °C
PCA9554CPW	PCA9554CPWJ	TSSOP16	Reel pack, SMD, 13-inch	2500	T _{amb} = -40 °C to +85 °C

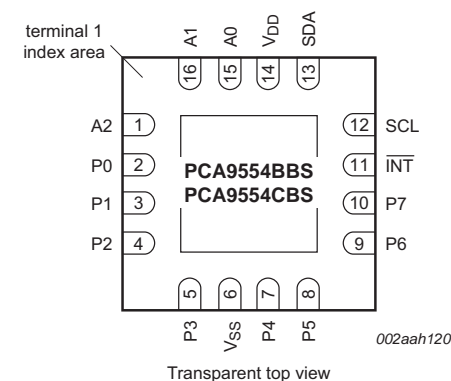

Fig 3. Pin configuration for HVQFN16

5.2 Pin description

Table 3. Pin description

Symbol	Pin		Description
	TSSOP16	HVQFN16	
A0	1	15	address input 0
A1	2	16	address input 1
A2	3	1	address input 2
P0 ^[1]	4	2	Port P input/output 0
P1 ^[1]	5	3	Port P input/output 1
P2 ^[1]	6	4	Port P input/output 2
P3 ^[1]	7	5	Port P input/output 3
V _{SS}	8	6 ^[2]	supply ground
P4 ^[1]	9	7	Port P input/output 4
P5 ^[1]	10	8	Port P input/output 5
P6 ^[1]	11	9	Port P input/output 6
P7 ^[1]	12	10	Port P input/output 7
INT	13	11	interrupt output (open-drain)
SCL	14	12	serial clock line
SDA	15	13	serial data line
V _{DD}	16	14	supply voltage

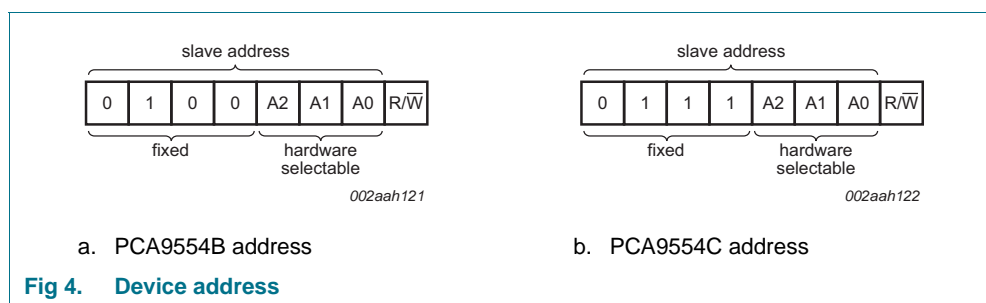

[1] All I/O are configured as input at power-on.

[2] HVQFN16 package die supply ground is connected to both the V_{SS} pin and the exposed center pad. The V_{SS} pin must be connected to supply ground for proper device operation. For enhanced thermal, electrical, and board-level performance, the exposed pad needs to be soldered to the board using a corresponding thermal pad on the board, and for proper heat conduction through the board thermal vias need to be incorporated in the printed-circuit board in the thermal pad region.

6. Functional description

Refer to [Figure 1 “Block diagram of PCA9554B; PCA9554C”](#).

6.1 Device address

A2, A1 and A0 are the hardware address package pins and are held to either HIGH (logic 1) or LOW (logic 0) to assign one of the eight possible slave addresses. The last bit of the slave address (R/W) defines the operation (read or write) to be performed. A HIGH (logic 1) selects a read operation, while a LOW (logic 0) selects a write operation.

6.2 Pointer register and command byte

Following the successful acknowledgement of the address byte, the bus master sends a command byte, which is stored in the Pointer register in the PCA9554B/PCA9554C. Two bits of this data byte state the operation (read or write) and the internal registers (Input, Output, Polarity Inversion, or Configuration) that will be affected. This register is write only.

Table 4. Command byte

Pointer register bits								Command byte (hexadecimal)	Register	Protocol	Power-up default
B7	B6	B5	B4	B3	B2	B1	B0				
0	0	0	0	0	0	0	0	00h	Input port	read byte	xxxx xxxx ^[1]
0	0	0	0	0	0	0	1	01h	Output port	read/write byte	1111 1111
0	0	0	0	0	0	1	0	02h	Polarity Inversion	read/write byte	0000 0000
0	0	0	0	0	0	1	1	03h	Configuration	read/write byte	1111 1111

[1] Undefined.

6.3 Interface definition

Table 5. Interface definition

Byte	Bit							
	7 (MSB)	6	5	4	3	2	1	0 (LSB)
PCA9554B I ² C-bus slave address	L	H	L	L	A2	A1	A0	R/W
PCA9554C I ² C-bus slave address	L	H	H	H	A2	A1	A0	R/W
I/O data bus	P7	P6	P5	P4	P3	P2	P1	P0

6.4 Register descriptions

6.4.1 Input port register (00h)

The Input port register (register 0) reflects the incoming logic levels of the pins, regardless of whether the pin is defined as an input or an output by the Configuration register. The Input port register is read only; writes to this register have no effect. The default value 'X' is determined by the externally applied logic level. An Input port register read operation is performed as described in [Section 7.2 "Read commands"](#).

Table 6. Input port register (address 00h)

Bit	7	6	5	4	3	2	1	0
Symbol	I7	I6	I5	I4	I3	I2	I1	I0
Default	X	X	X	X	X	X	X	X

6.4.2 Output port register (01h)

The Output port register (register 1) shows the outgoing logic levels of the pins defined as outputs by the Configuration register. Bit values in these registers have no effect on pins defined as inputs. In turn, reads from this register reflect the value that was written to this register, **not** the actual pin value.

Table 7. Output port register (address 01h)

Bit	7	6	5	4	3	2	1	0
Symbol	O7	O6	O5	O4	O3	O2	O1	O0
Default	1	1	1	1	1	1	1	1

6.4.3 Polarity inversion register (02h)

The Polarity inversion register (register 2) allows polarity inversion of pins defined as inputs by the Configuration register. If a bit in this register is set (written with '1'), the corresponding port pin's polarity is inverted. If a bit in this register is cleared (written with a '0'), the corresponding port pin's original polarity is retained.

Table 8. Polarity inversion register (address 02h)

Bit	7	6	5	4	3	2	1	0
Symbol	N7	N6	N5	N4	N3	N2	N1	N0
Default	0	0	0	0	0	0	0	0

6.4.4 Configuration register (03h)

The Configuration register (register 3) configures the direction of the I/O pins. If a bit in this register is set to 1, the corresponding port pin is enabled as a high-impedance input. If a bit in this register is cleared to 0, the corresponding port pin is enabled as an output.

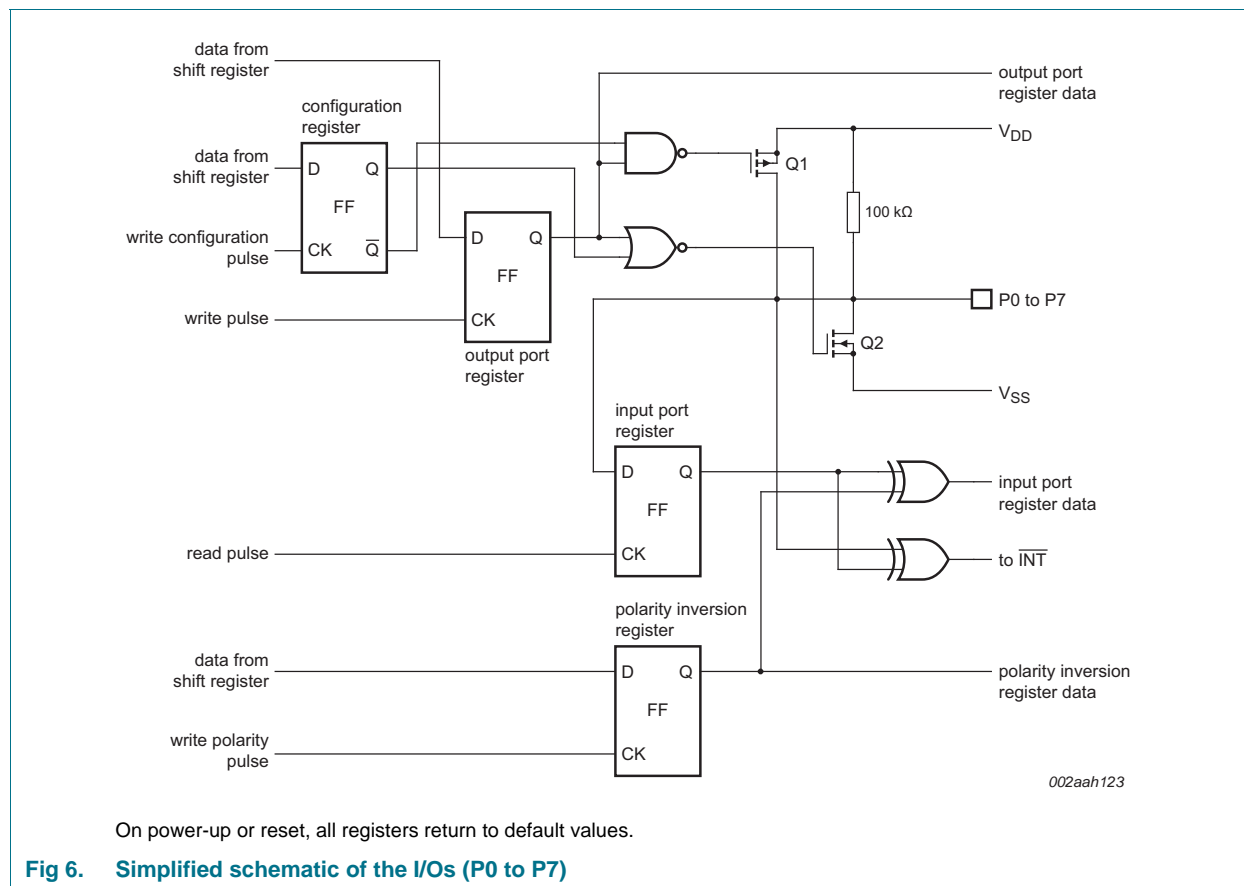

Table 9. Configuration register (address 03h)

Bit	7	6	5	4	3	2	1	0
Symbol	C7	C6	C5	C4	C3	C2	C1	C0
Default	1	1	1	1	1	1	1	1

6.5 I/O port

When an I/O is configured as an input, FETs Q1 and Q2 are off, which creates a high-impedance input. The input voltage may be raised above V_{DD} to a maximum of 5.5 V.

If the I/O is configured as an output, Q1 or Q2 is enabled, depending on the state of the Output port register. In this case, there are low-impedance paths between the I/O pin and either V_{DD} or V_{SS} . The external voltage applied to this I/O pin should not exceed the recommended levels for proper operation.

6.6 Power-on reset

When power (from 0 V) is applied to V_{DD} , an internal power-on reset holds the PCA9554B/PCA9554C in a reset condition until V_{DD} has reached V_{POR} . At that time, the reset condition is released and the PCA9554B/PCA9554C registers and I²C-bus/SMBus state machine initialize to their default states. After that, V_{DD} must be lowered to below V_{PORF} and back up to the operating voltage for a power-reset cycle. See [Section 8.2](#) “Power-on reset requirements”.

6.7 Interrupt output (\overline{INT})

An interrupt is generated by any rising or falling edge of the port inputs in the Input mode. After time $t_{V(INT)}$, the signal \overline{INT} is valid. Resetting the interrupt circuit is achieved when data on the port is changed to the original setting or when data is read from the port that generated the interrupt (see [Figure 10](#)). Resetting occurs in the Read mode at the acknowledge (ACK) or not acknowledge (NACK) bit after the rising edge of the SCL signal. Interrupts that occur during the ACK or NACK clock pulse can be lost (or be very short) due to the reset of the interrupt during this pulse. Each change of the I/Os after resetting is detected and is transmitted as \overline{INT} .

A pin configured as an output cannot cause an interrupt. Changing an I/O from an output to an input may cause a false interrupt to occur, if the state of the pin does not match the contents of the Input port register.

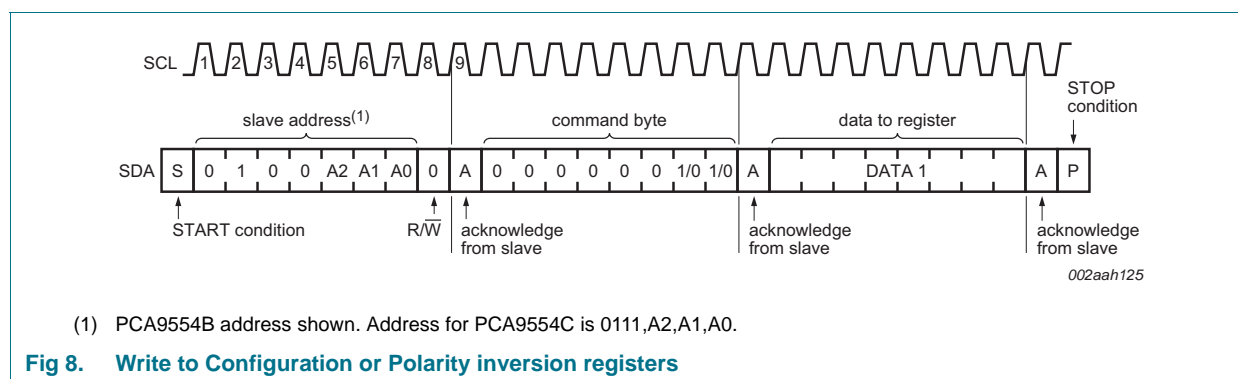

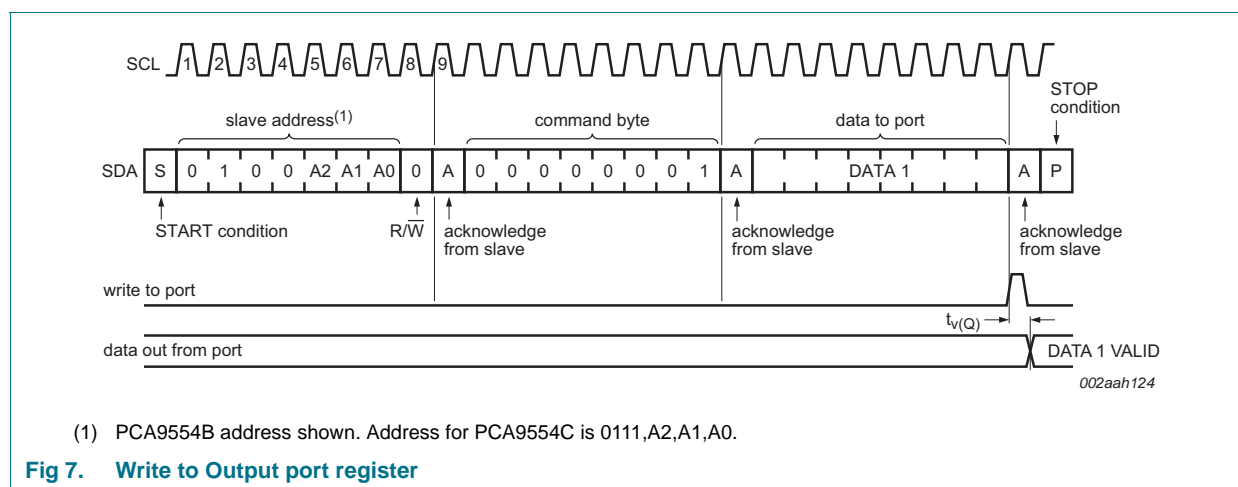

The \overline{INT} output has an open-drain structure and requires a pull-up resistor to V_{DD} . \overline{INT} should be connected to the voltage source of the device that requires the interrupt information. When using the input latch feature, the input pin state is latched. The interrupt is reset only when data is read from the port that generated the interrupt. The reset occurs in the Read mode at the acknowledge (ACK) or not acknowledge (NACK) bit after the rising edge of the SCL signal.

7. Bus transactions

The PCA9554B/PCA9554C is an I²C-bus slave device. Data is exchanged between the master and PCA9554B/PCA9554C through write and read commands using I²C-bus. The two communication lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

7.1 Write commands

Data is transmitted to the PCA9554B/PCA9554C by sending the device address and setting the Least Significant Bit (LSB) to a logic 0 (see [Figure 4](#) for device address). The command byte is sent after the address and determines which register receives the data that follows the command byte. There is no limitation on the number of data bytes sent in one write transmission.

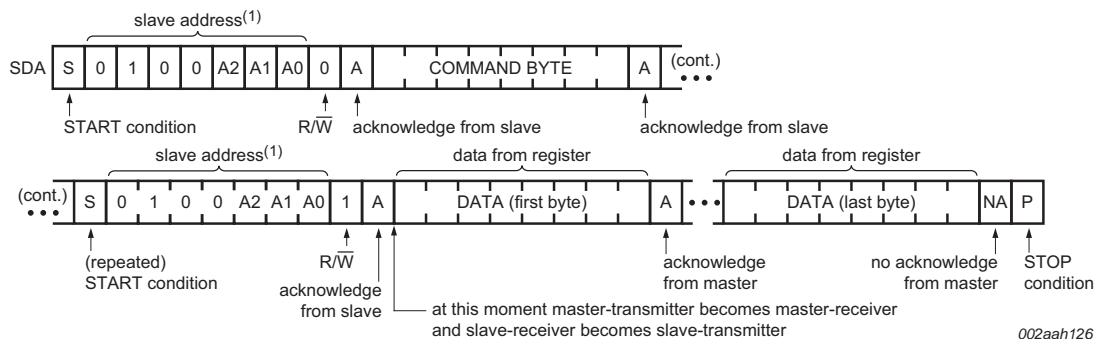

7.2 Read commands

To read data from the PCA9554B/PCA9554C, the bus master must first send the PCA9554B/PCA9554C address with the least significant bit set to a logic 0 (see [Figure 4](#) for device address). The command byte is sent after the address and determines which register is to be accessed.

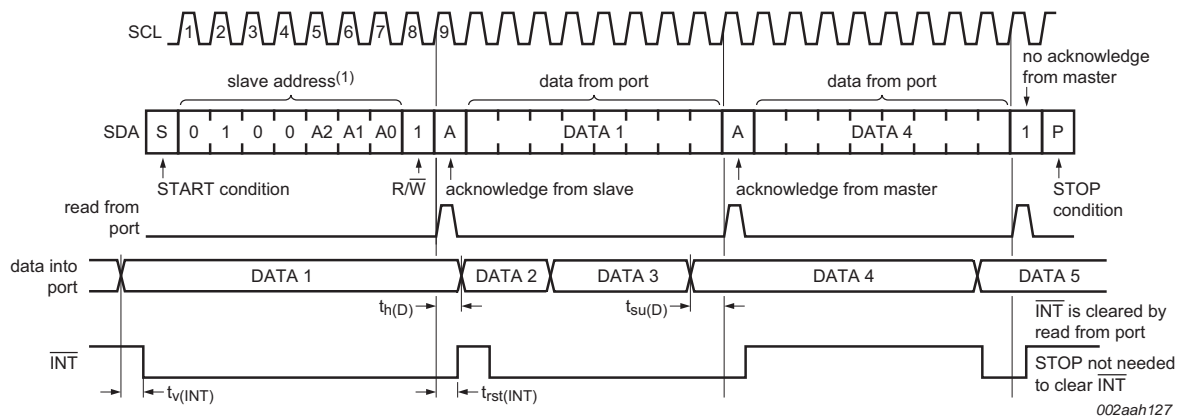

After a restart the device address is sent again, but this time the LSB is set to a logic 1. Data from the register defined by the command byte then is sent by the PCA9554B/PCA9554C (see [Figure 9](#) and [Figure 10](#)).

Data is clocked into the register on the rising edge of the ACK clock pulse. There is no limit on the number of data bytes received in one read transmission, but on the final byte received the bus master must not acknowledge the data.

(1) PCA9554B address shown. Address for PCA9554C is 0111,A2,A1,A0.

Fig 9. Read from register

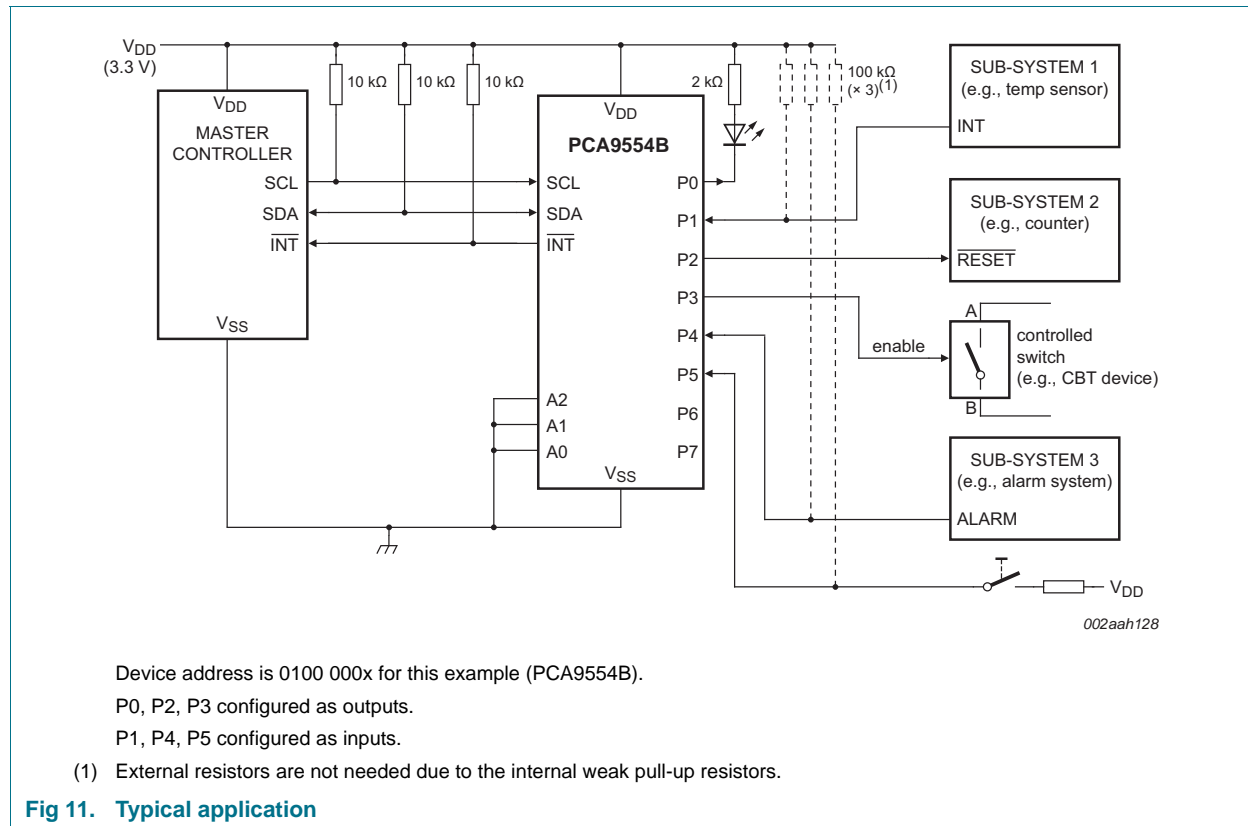

Transfer of data can be stopped at any time by a STOP condition. When this occurs, data present at the latest acknowledge phase is valid (output mode). It is assumed that the command byte has previously been programmed with 00h (read Input port register).

This figure eliminates the command byte transfer, a restart, and slave address call between the initial slave address call and actual data transfer from P port (see [Figure 9](#)).

(1) PCA9554B address shown. Address for PCA9554C is 0111,A2,A1,A0.

Fig 10. Read Input port register

8. Application design-in information

8.1 Minimizing I_{DD} when the I/Os are used to control LEDs

When the I/Os are used to control LEDs, they are normally connected to V_{DD} through a resistor as shown in [Figure 11](#). Since the LED acts as a diode, when the LED is off the I/O V_I is about 1.2 V less than V_{DD}. The supply current, I_{DD}, increases as V_I becomes lower than V_{DD}.

Designs needing to minimize current consumption, such as battery power applications, should consider maintaining the I/O pins greater than or equal to V_{DD} when the LED is off. [Figure 12](#) and [Figure 13](#) show typical solutions to minimizing current consumption. [Figure 12](#) shows a high value resistor in parallel with the LED. [Figure 13](#) shows V_{DD} less than the LED supply voltage by at least 1.2 V. However, the PCA9554B/PCA9554C needs no external resistors due to the integrated 100 kΩ pull-up resistors.

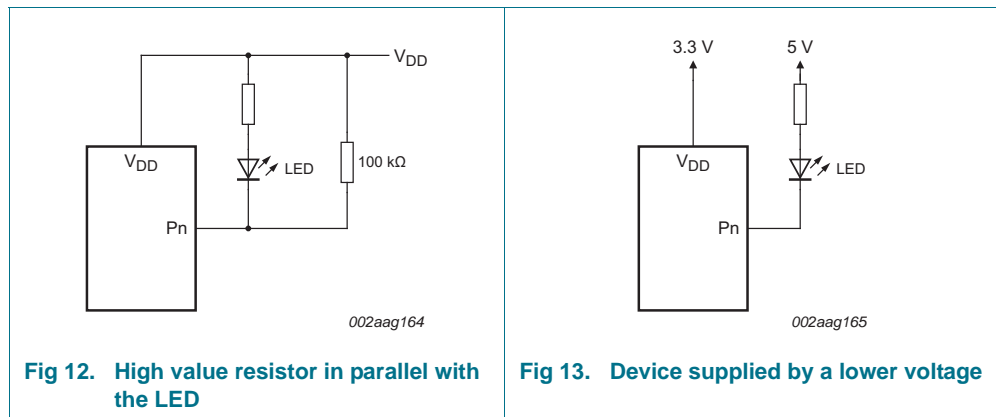

Fig 12. High value resistor in parallel with the LED

Fig 13. Device supplied by a lower voltage

8.2 Power-on reset requirements

In the event of a glitch or data corruption, PCA9554B/PCA9554C can be reset to its default conditions by using the power-on reset feature. Power-on reset requires that the device go through a power cycle to be completely reset. This reset also happens when the device is powered on for the first time in an application.

The two types of power-on reset are shown in [Figure 14](#) and [Figure 15](#).

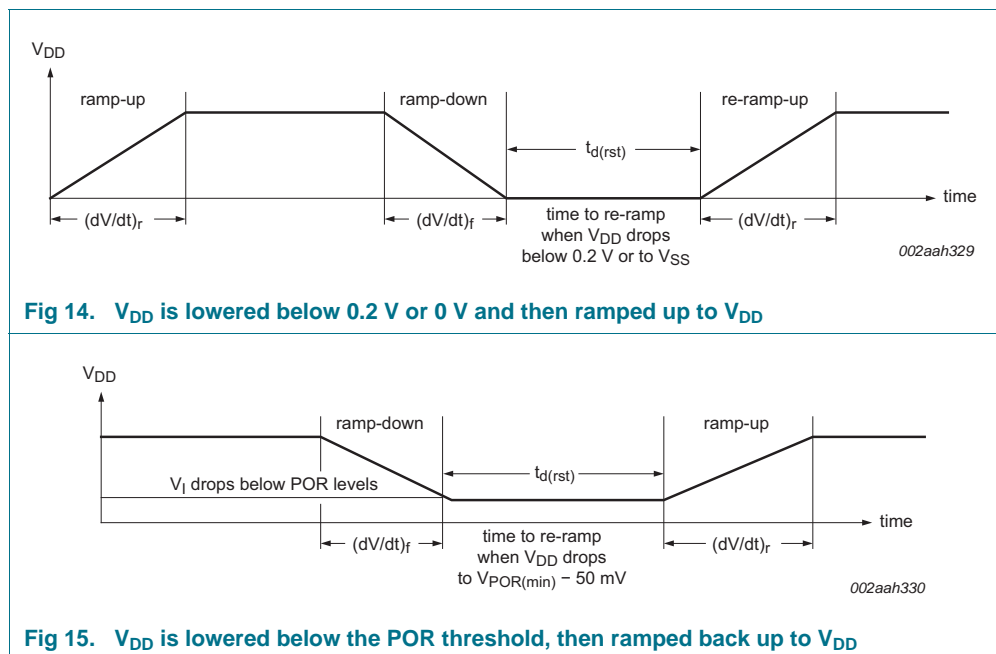

Fig 14. V_{DD} is lowered below 0.2 V or 0 V and then ramped up to V_{DD}

Fig 15. V_{DD} is lowered below the POR threshold, then ramped back up to V_{DD}

[Table 10](#) specifies the performance of the power-on reset feature for PCA9554B/PCA9554C for both types of power-on reset.

Table 10. Recommended supply sequencing and ramp rates*T_{amb} = 25 °C (unless otherwise noted). Not tested; specified by design.*

Symbol	Parameter	Condition	Min	Typ	Max	Unit
(dV/dt) _f	fall rate of change of voltage	Figure 14	0.1	-	2000	ms
(dV/dt) _r	rise rate of change of voltage	Figure 14	0.1	-	2000	ms
t _{d(rst)}	reset delay time	Figure 14 ; re-ramp time when V _{DD} drops to V _{SS}	1	-	-	μs
		Figure 15 ; re-ramp time when V _{DD} drops to V _{POR(min)} – 50 mV	1	-	-	μs
ΔV _{DD(gl)}	glitch supply voltage difference	Figure 16	[1] -	-	1.0	V
t _{w(gl)VDD}	supply voltage glitch pulse width	Figure 16	[2] -	-	10	μs
V _{POR(trip)}	power-on reset trip voltage	falling V _{DD}	0.7	-	-	V
		rising V _{DD}	-	-	1.4	V

[1] Level that V_{DD} can glitch down to with a ramp rate of 0.4 μs/V, but not cause a functional disruption when t_{w(gl)VDD} < 1 μs.

[2] Glitch width that will not cause a functional disruption when ΔV_{DD(gl)} = 0.5 × V_{DD}.

Glitches in the power supply can also affect the power-on reset performance of this device. The glitch width (t_{w(gl)VDD}) and glitch height (ΔV_{DD(gl)}) are dependent on each other. The bypass capacitance, source impedance, and device impedance are factors that affect power-on reset performance. [Figure 16](#) and [Table 10](#) provide more information on how to measure these specifications.

**Fig 16. Glitch width and glitch height**

V_{POR} is critical to the power-on reset. V_{POR} is the voltage level at which the reset condition is released and all the registers and the I²C-bus/SMBus state machine are initialized to their default states. The value of V_{POR} differs based on the V_{DD} being lowered to or from 0 V. [Figure 17](#) and [Table 10](#) provide more details on this specification.

**Fig 17. Power-on reset voltage (V_{POR})**

8.3 Device current consumption with internal pull-up and pull-down resistors

The PCA9554B/PCA9554C integrates programmable pull-up and pull-down resistors to eliminate external components when pins are configured as inputs and pull-up or pull-down resistors are required (for example, nothing is driving the inputs to the power supply rails). Since these pull-up and pull-down resistors are internal to the device itself, they contribute to the current consumption of the device and must be considered in the overall system design.

The pull-up or pull-down function is selected in registers 48h and 49h, while the resistor is connected by the enable registers 46h and 47h. The configuration of the resistors is shown in [Figure 6](#).

If the resistor is configured as a pull-up, that is, connected to V_{DD} , a current will flow from the V_{DD} pin through the resistor to ground when the pin is held LOW. This current will appear as additional I_{DD} upsetting any current consumption measurements.

In the same manner, if the resistor is configured as a pull-down and the pin is held HIGH, current will flow from the power supply through the pin to the V_{SS} pin. While this current will not be measured as part of I_{DD} , one must be mindful of the 200 mA limiting value through V_{SS} .

The pull-up and pull-down resistors are simple resistors and the current is linear with voltage. The resistance specification for these devices spans from 50 k Ω with a nominal 100 k Ω value. Any current flow through these resistors is additive by the number of pins held HIGH or LOW and the current can be calculated by Ohm's law. See [Figure 21](#) for a graph of supply current versus the number of pull-up resistors.

9. Limiting values

Table 11. Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
V _{DD}	supply voltage		-0.5	+6.5	V
V _I	input voltage		[1] -0.5	+6.5	V
V _O	output voltage		[1] -0.5	+6.5	V
I _{IK}	input clamping current	A0, A1, A2, SCL; V _I < 0 V	-	±20	mA
I _{OK}	output clamping current	$\overline{\text{INT}}$; V _O < 0 V	-	±20	mA
I _{IOK}	input/output clamping current	P port; V _O < 0 V or V _O > V _{DD}	-	±20	mA
		SDA; V _O < 0 V or V _O > V _{DD}	-	±20	mA
I _{OL}	LOW-level output current	continuous; I/O port	-	50	mA
		continuous; SDA, $\overline{\text{INT}}$	-	25	mA
I _{OH}	HIGH-level output current	continuous; P port	-	25	mA
I _{DD}	supply current		-	160	mA
I _{SS}	ground supply current		-	200	mA
P _{tot}	total power dissipation		-	200	mW
T _{stg}	storage temperature		-65	+150	°C
T _{j(max)}	maximum junction temperature		-	125	°C

[1] The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.

10. Recommended operating conditions

Table 12. Operating conditions

Symbol	Parameter	Conditions	Min	Max	Unit
V _{DD}	supply voltage		1.65	5.5	V
V _{IH}	HIGH-level input voltage	SCL, SDA	$0.7 \times V_{DD}$	5.5	V
		A0, A1, A2, P port	$0.7 \times V_{DD}$	5.5	V
V _{IL}	LOW-level input voltage	SCL, SDA	-0.5	$0.3 \times V_{DD}$	V
		A0, A1, A2, P port	-0.5	$0.3 \times V_{DD}$	V
I _{OH}	HIGH-level output current	P port	-	10	mA
I _{OL}	LOW-level output current	P port	-	25	mA
T _{amb}	ambient temperature	operating in free air	-40	+85	°C

11. Thermal characteristics

Table 13. Thermal characteristics

Symbol	Parameter	Conditions	Max	Unit
Z _{th(j-a)}	transient thermal impedance from junction to ambient	HVQFN16 package	[1] 53	K/W
		TSSOP16 package	[1] 108	K/W

[1] The package thermal impedance is calculated in accordance with JESD 51-7.

12. Static characteristics

Table 14. Static characteristics

$T_{amb} = -40\text{ }^{\circ}\text{C}$ to $+85\text{ }^{\circ}\text{C}$; $V_{DD} = 1.65\text{ V}$ to 5.5 V ; unless otherwise specified.

16. Handling information

All input and output pins are protected against ElectroStatic Discharge (ESD) under normal handling. When handling ensure that the appropriate precautions are taken as described in *JESD625-A* or equivalent standards.

17. Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

17.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

17.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

17.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

17.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see [Figure 31](#)) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with [Table 17](#) and [18](#)

Table 17. SnPb eutectic process (from J-STD-020C)

Package thickness (mm)	Package reflow temperature (°C)	
	Volume (mm ³)	
	< 350	≥ 350
< 2.5	235	220
≥ 2.5	220	220

Table 18. Lead-free process (from J-STD-020C)

Package thickness (mm)	Package reflow temperature (°C)		
	Volume (mm ³)		
	< 350	350 to 2000	> 2000
< 1.6	260	260	260
1.6 to 2.5	260	250	245
> 2.5	250	245	245

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see [Figure 31](#).

For further information on temperature profiles, refer to Application Note *AN10365* "Surface mount reflow soldering description".

Document ID	Release date	Data sheet status	Change notice	Supersedes
PCA9554B_PCA9554C v.1	20120919	Product data sheet	-	-

21. Legal information

21.1 Data sheet status

Document status ^{[1][2]}	Product status ^[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

21.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

21.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's

own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Translations — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.
