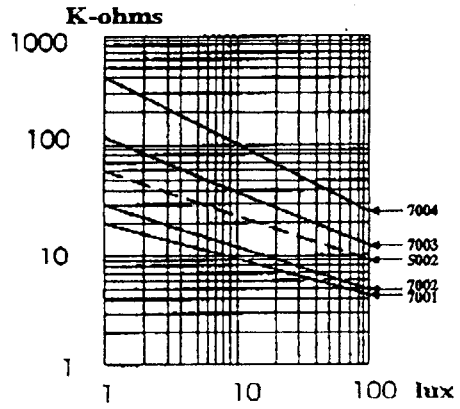
· Cell resistance vs. illuminance



A.Measured with the light source of a tungsten lamp operated at a color temperature of 2856K.

B.Measured 10 seconds after removal of incident illuminance of 10 lux.

C.Gamma characteristic between 10 lux and 100 lux and gievn by

$$= \frac{\log(R100)-\log(R10)}{\log(E100)-\log(E10)}$$

Where R100, R10: cell resistances at 100 lux and 10 lux re spectively
E100, E10: illuminances of 100 lux and 10 lux respec tively

D.The rise time is the time required for the cell conductance to rise to 63% of the saturated level. The decay time is the time required for the cell conductance to decay from the saturated level to 37%.

E. All characteristics are measured with the light history conditions: the CdS cell is exposed to light (100 to 500 lux) for one to two hours.
