GENERAL DESCRIPTION

The Micross Components SRAM family employs high-speed, low-power CMOS designs using a four-transistor memory cell. Micross Components SRAMs are fabricated using double-layer metal, double-layer polysilicon technology.

For flexibility in high-speed memory applications, Micross Components offers chip enable (CE\) and output enable (OE\) capability. These enhancements can place the outputs in High-Z for additional flexibility in system design. Writing to these devices is accomplished when write enable (WE\) and CE\ inputs are both LOW. Reading is accomplished when WE\ remains HIGH and CE\ and OE\ go LOW. The device offers a reduced power standby mode when disabled. This allows system designs to achieve low standby power requirements.

The "L" version provides an approximate 50 percent reduction in CMOS standby current (I_{SBC2}) over the standard version.

All devices operate from a single +5V power supply and all inputs and outputs are fully TTL compatible.

NOTES

- All voltages referenced to V_{SS} (GND).
- 3V for pulse width < 20ns
- I_{CC} is dependent on output loading and cycle rates. The specified value applies with the outputs unloaded, and $f = \frac{1}{RC (MIN)}$ Hz.
- This parameter is guaranteed but not tested.
- Test conditions as specified with the output loading as shown in Fig. 1 unless otherwise noted.
- t_{HZCE}, t_{HZOE} and t_{HZWE} are specified with CL = 5pF as in Fig. 2. Transition is measured ±500mV typical from steady state voltage, allowing for actual tester RC time constant.
- At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE}, and t_{HZWE} is less than t_{LZWE} and t_{HZOE} is less than t_{LZOE}.
- WE\ is HIGH for READ cycle.
- Device is continuously selected. Chip enable is held in its active state.
- Address valid prior to, or coincident with, latest occurring chip enable.
- t_{RC} = Read Cycle Time.
- Chip enable (CE\) and write enable (WE\) can initiate and terminate a WRITE cycle.
