

LMS5214

80mA, Low Dropout Voltage Regulator with Auto Discharge Function in SC70

General Description

The LMS5214 is a μ Cap, low dropout voltage regulator with very low quiescent current, 110 μ A typical, at 80mA load. It also has very low dropout voltage, typically 2mV at light load and 300mV at 80mA.

The LMS5214 is an enhanced version of the industry standard LMS5213 with auto discharge function which actively discharges the output voltage to ground when the device is placed in shutdown mode. It provides up to 80mA and consumes a typical of 10nA in disable mode, which helps to extend the battery life.

The LMS5214 is optimized to work with low value, low cost ceramic capacitors. The output typically requires only 470nF of output capacitance for stability. The enable pin can be tied to V_{IN} for easy device layout.

Low ground current at full load and small package makes the LMS5214 ideal for portable, battery powered equipment applications with small space requirements.

The LMS5214 is available in a space saving 5-pin SC70 package. Performance is specified for the -40°C to $+125^{\circ}\text{C}$ temperature range and is available in 2.5V, 2.6V, 2.8V, 2.9V, 3.0V and 3.3V fixed voltages. For other output voltage options, please contact National Semiconductor.

Features

(Typical unless noted)

- Space saving SC70 package
- Low quiescent current: 70 μ A
- Low dropout voltage: 2mV
- Stability with low-ESR ceramic capacitors
- Auto discharge
- Fast turn-on
- Low temperature coefficient
- Current and thermal limiting
- Zero current in shutdown mode
- Pin-to-pin compatible with LMS5213

Applications

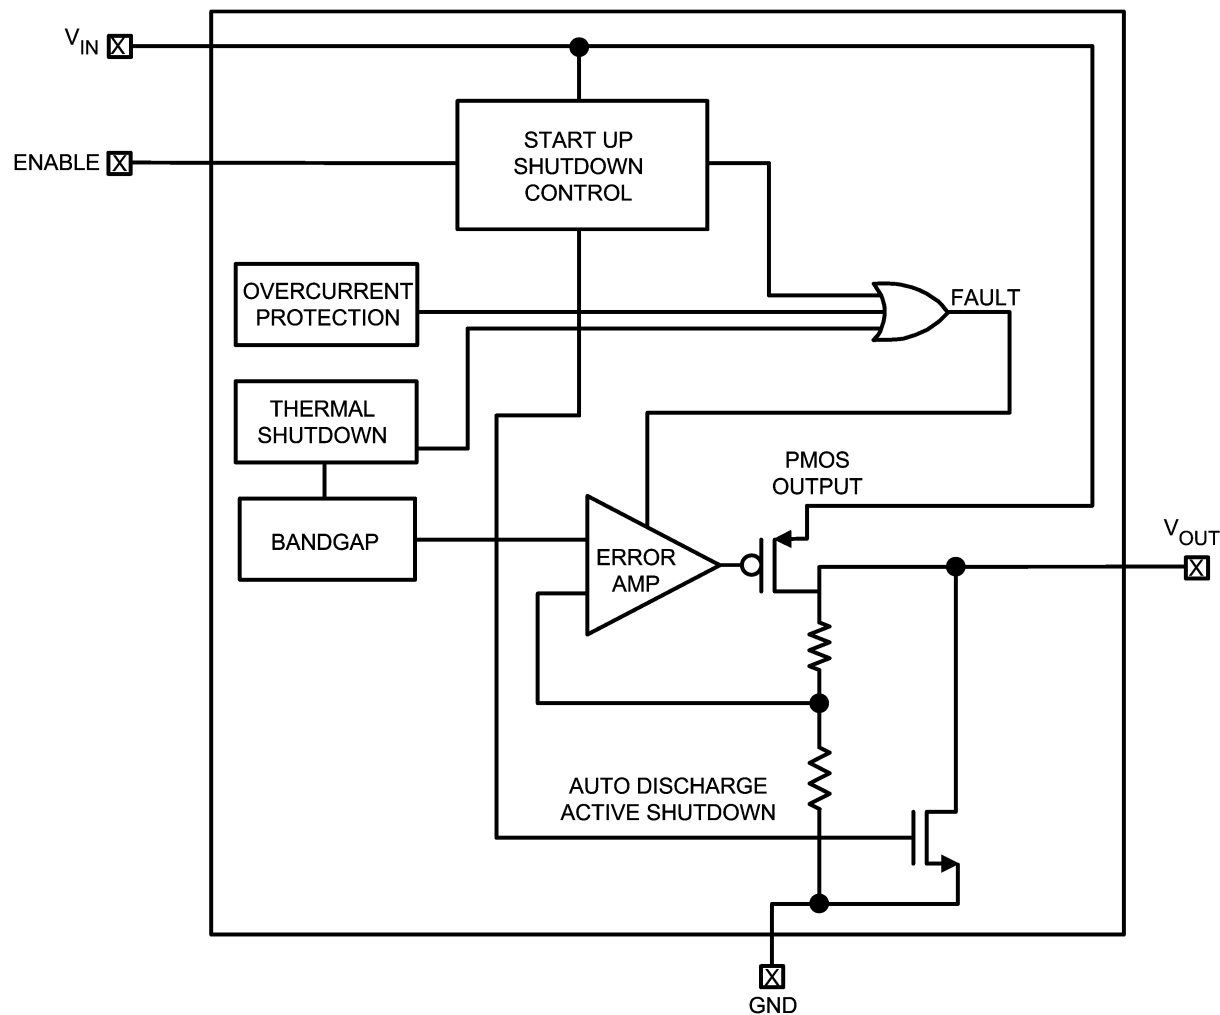

- Cellular Phones
- Battery-powered equipment
- Bar code scanner
- Laptops, notebooks, PDA's
- High-efficiency linear power supplies

Typical Application

20043120

Simplified Schematic

20043101

Pin Description

Pin Number	Pin Name	Pin Function
1	V_{EN}	Enable Input Logic, Logic High = Enabled Logic Low = Shutdown
2	NC	Not internally connected
3	GND	Ground
4	V_{OUT}	Output Voltage
5	V_{IN}	Input Voltage

Connection Diagram

Enable Input

V_{IL}	Enable Input Voltage Level	Logic Low (off)			0.6	V
V_{IH}		Logic High (on)	2.0			V
I_{IL}	Enable Input Current	$V_{IL} \leq 0.6\text{V}$		0.01	1	μA
I_{IH}		$V_{IH} \geq 2.0\text{V}$		0.01	5	μA

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not guaranteed. For guaranteed specifications and the test conditions, see the Electrical Characteristics.

Note 2: Human body model, 1.5k Ω in series with 100pF.

Note 3: The maximum power dissipation is a function of $T_{J(MAX)}$, θ_{JA} , and T_A . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A)/\theta_{JA}$. All numbers apply for packages soldered directly into a PC board.

Note 4: Typical Values represent the most likely parametric norm.

Note 5: All limits are guaranteed by testing or statistical analysis.

Note 6: Regulation is measured at constant junction temperature using low duty cycle pulse testing. Changes in output voltage due to heating effects are covered by the thermal regulation specification.

Note 7: Dropout voltage is defined as the input to output differential at which the output voltage drops 2% below its nominal value measured at 1V differential.

Note 8: Ground pin current is the regulator quiescent current plus pass transistor base current. The total current drawn from the supply is the sum of the load current plus the ground pin current.

Note 9: Thermal regulation is defined as the change in output voltage at a time "t" after a change in power dissipation is applied, excluding load or line regulation effects. Specifications are for an 80mA load pulse at $V_{IN} = 6\text{V}$ for $t = 16\text{ms}$.

Note 10: Output voltage temperature coefficient is defined as the worst-case voltage change divided by the total temperature range.

Typical Characteristics

Unless otherwise specified, $T_A = 25^\circ\text{C}$, $V_{\text{OUT}} = 2.8\text{V}$, $C_L = 0.47\mu\text{F}$

Application Information

The LMS5214 is a low dropout, linear regulator designed primarily for battery-powered applications. The LMS5214 can be used with low cost ceramic capacitors, typical value of 470nF.

The LMS5214 is an enhanced version of the LMS5213 with auto discharge function which actively discharges the output voltage to ground when the device is placed in shutdown mode.

As illustrated in the simplified schematics, the LMS5214 consists of a 1.25V reference, error amplifier, P-channel pass transistor and internal feedback voltage divider. The 1.25V reference is connected to the input of the error amp. The error amp compares this reference with the feedback voltage. If the feedback voltage is lower than the reference, the pass transistor gate is pulled lower allowing more current to pass and increasing the output voltage. If the feedback voltage is too high, the pass transistor gate is pulled up allowing less current to pass to the output. The output voltage is fed back through the resistor divider. Additional blocks include short circuit current protection and thermal protection.

The LMS5214 features an 80mA P-channel MOSFET transistor. This provides several advantages over similar designs using PNP pass transistors including longer battery life.

The P-channel MOSFET requires no base drive, which reduces quiescent current considerably. PNP based regulators waste considerable amounts of current in dropout when the pass transistor saturates. They also have high base drive currents under large loads. The LMS5214 does not suffer from these problems and consumes only the specified quiescent current under light and heavy loads.

External Capacitors

Like any low-dropout regulators, the LMS5214 requires external capacitors for regulator stability. The LMS5214 is specially designed for portable applications requiring minimum board space and the smallest components.

A 1 μF capacitor should be placed from V_{IN} to GND if there is more than 10 inches of wire between the input and AC filter or when a battery is used as the input. This capacitor must be located a distance of not more than 1cm from the input pin and returned to a clean analog ground.

The LMS5214 is designed to work with high quality tantalum capacitors and small ceramic output capacitors. Ceramic capacitors ranging between 470nF to 4.7 μF are the smallest and least expensive.

No-Load Stability

The LMS5214 will remain stable and in regulation with no-load (other than the internal voltage divider). This is especially important in CMOS RAM keep-alive applications.

Enable Input

The LMS5214 is shut off by pulling the V_{EN} pin below 0.6V; all internal circuitry is powered off and the quiescent current is typically 10nA. Pulling the V_{EN} high above 2V re-enables the device and allows operation. If the shut down feature is not used, the V_{EN} pin should be tied to V_{IN} to keep the regulator output on all the time.

Thermal Behavior

The LMS5214 regulator has internal thermal shutdown to protect the device from over heating. Under all operating conditions, the maximum junction temperature of the LMS5214 must be below 125°C . Maximum power dissipation can be calculated based on the output current and the voltage drop across the part. The maximum power dissipation is

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

θ_{JA} is the junction-to-ambient thermal resistance, 478°C/W for the LMS5214 in the SC70 package. T_A is the maximum ambient temperature $T_{J(MAX)}$ is the maximum junction temperature of the die, 125°C

When operating the LMS5214 at room temperature, the maximum power dissipation is 209mW.

The actual power dissipated by the regulator is

$$P_D = (V_{IN} - V_{OUT}) I_L + V_{IN} I_{GND}$$

The figure below shows the voltage and currents, which are present in the circuit.

Application Information (Continued)

FIGURE 1. Power Dissipation Diagram

Substituting $P_{D(MAX)}$, determined above, for P_D and solving for the operating condition that are critical to the application will give the maximum operating conditions for the regulator circuit. To prevent the device from entering thermal shut-down, maximum power dissipation cannot be exceeded.

Fixed Voltage Regulator

The LMS5214 offers a smaller system solution that is ideal for general-purpose voltage regulation in any handheld device.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
