

## LIN 2.1 / SAEJ2602-2 Dual LIN Physical Layer

The local interconnect network (LIN) is a serial communication protocol designed to support automotive networks in conjunction with controller area network (CAN). As the lowest level of a hierarchical network, LIN enables cost-effective communication with sensors and actuators when all the features of CAN are not required.

The 33663 product line integrates two physical layer LIN bus dedicated to automotive LIN sub-bus applications. The MC33663LEF and MC33663SEF devices offer normal baud rate (20 kbps) and the MC33663JEF slow baud rate (10 kbps). Both devices integrate fast baud rate (above 100 kbps) for test and programming modes. They present excellent electromagnetic compatibility (EMC) and radiated emission performance, electrostatic discharge (ESD) robustness and safe behavior, in the event of LIN bus short-to-ground or LIN bus leakage during low-power mode.

### Features

- Operational from  $V_{SUP}$  7.0 to 18 V DC, functional up to 27 V DC, and handles 40 V during load dump
- Compatible with LIN protocol specification 2.1, and SAEJ2602-2
- Very high immunity against electromagnetic interference
- Low standby current in Sleep mode
- Over-temperature protection
- Permanent dominant state detection
- Fast baud rate mode selection reported by RXD
- Active bus waveshaping offering excellent radiated emission performance
- Sustains  $\pm 15.0$  kV ESD IEC6100-4-2 on LIN BUS and VSUP pins
- 5.0 and 3.3 V compatible digital inputs without any external components required

# PIN CONNECTIONS

Figure 3. 33663 14-SOIC Pin Connections

Table 2. 33663 Pin Definitions

Pin	Pin Name	Formal Name	Definition
1	WAKE1	Wake Input	This pin is a high-voltage input used to wake-up the LIN1 from Sleep mode.
2	TXD1	Data Input	This pin is the transmitter input of the LIN1 interface which controls the state of the bus output.
3	LIN1	LIN Bus	This bidirectional pin represents the LIN1 single-wire bus transmitter and receiver.
4	LIN2	LIN Bus	This bidirectional pin represents the LIN2 single-wire bus transmitter and receiver.
5	INH2	Inhibit Output	This pin can have two main functions: controlling an external switchable voltage regulator having an inhibit input, or driving an external bus resistor connected to LIN2 in the master node application.
6	RXD2	Data Output	This pin is the receiver output of the LIN2 interface, which reports the state of the bus voltage to the MCU interface.
7	EN2	Enable Control	This pin controls the operation mode of the LIN2 interface.
8	WAKE2	Wake Input	This pin is a high-voltage input used to wake-up the LIN2 device from Sleep mode.
9	GND	Ground	This pin is the device ground pin.
10	TXD2	Data Input	This pin is the transmitter input of the LIN2 interface, which controls the state of the bus output.
11	VSUP	Power Supply	This pin is device battery level power supply.
12	INH1	Inhibit Output	This pin can have two main functions: controlling an external switchable voltage regulator having an inhibit input, or driving an external bus resistor connected to LIN1 in the master node application.
13	RXD1	Data Output	This pin is the receiver output of the LIN1 interface, which reports the state of the bus voltage to the MCU interface.
14	EN1	Enable Control	This pin controls the operation mode of the LIN1 interface.

# ELECTRICAL CHARACTERISTICS

## MAXIMUM RATINGS

**Table 3. Maximum Ratings**

All voltages are with respect to ground unless otherwise noted. Exceeding these ratings may cause a malfunction or permanent damage to the device.

Ratings	Symbol	Value	Unit
<b>ELECTRICAL RATINGS</b>			
<b>Power Supply Voltage (VSUP)</b> Normal Operation (DC) Transient input voltage with external component (according to ISO7637-2 & ISO7637-3 & "Hardware Requirements for LIN, CAN, and Flexray Interfaces in Automotive Applications" specification Rev. 1.1/December 2nd, 2009) (See <a href="#">Table 4</a> and <a href="#">Figure 4</a> ) - Pulse 1 (test up to the limit for Damage - Class A <sup>(1)</sup> ) - Pulse 2a (test up to the limit for Damage - Class A <sup>(1)</sup> ) - Pulse 3a (test up to the limit for Damage - Class A <sup>(1)</sup> ) - Pulse 3b (test up to the limit for Damage - Class A <sup>(1)</sup> ) - Pulse 5b (Class A) <sup>(1)</sup>	VSUP(SS)     VSUP(S1) VSUP(S2A) VSUP(S3A) VSUP(S3B) VSUP(S5B)	-0.3 to 27     -100 +75 -150 +100 -0.3 to 40	V
<b>Logic Voltage (RXD<sub>1,2</sub>, TXD<sub>1,2</sub>, EN<sub>1,2</sub> Pins)</b>	VLOG	-0.3 to 5.5	V
<b>WAKE (VWAKE1, VWAKE2)</b> Normal Operation with in series 2*18 kΩ resistor (DC) Transient input voltage with external component (according to ISO7637-2 & ISO7637-3 & "Hardware Requirements for LIN, CAN and Flexray Interfaces in Automotive Applications" specification Rev1.1 / December 2nd, 2009) (See <a href="#">Table 4</a> and <a href="#">Figure 5</a> ) - Pulse 1 (test up to the limit for Damage - Class D <sup>(2)</sup> ) - Pulse 2a (test up to the limit for Damage - Class D <sup>(2)</sup> ) - Pulse 3a (test up to the limit for Damage - Class D <sup>(2)</sup> ) - Pulse 3b (test up to the limit for Damage - Class D <sup>(2)</sup> )	VWAKE(SS)     VWAKE(S1) VWAKE(S2A) VWAKE(S3A) VWAKE(S3B)	-27 to 40     -100 +75 -150 +100	V
<b>LIN Bus Voltage (VLIN1, VLIN2)</b> Normal Operation (DC) Transient (Coupled Through 1.0 nF Capacitor) (according to ISO7637-2 & ISO7637-3) (See <a href="#">Table 4</a> and <a href="#">Figure 6</a> ) - Pulse 1 (test up to the limit for Damage - Class D <sup>(2)</sup> ) - Pulse 2a (test up to the limit for Damage - Class D <sup>(2)</sup> ) - Pulse 3a (test up to the limit for Damage - Class D <sup>(2)</sup> ) - Pulse 3b (test up to the limit for Damage - Class D <sup>(2)</sup> )	VLIN(SS)     VLIN(S1) VLIN(S2A) VLIN(S3A) VLIN(S3B)	-27 to 40     -100 +75 -150 +100	V

**Notes**

- Class A: All functions of a device/system perform as designed during and after exposure to disturbance.
- Class D: At least one function of the Transceiver stops working properly during the test and will return into proper operation automatically when the exposure to the disturbance has ended. No physical damage of the IC occurs.

**Table 3. Maximum Ratings**

All voltages are with respect to ground unless otherwise noted. Exceeding these ratings may cause a malfunction or permanent damage to the device.

Ratings	Symbol	Value	Unit
<b>ELECTRICAL RATINGS</b>			
INH Voltage/Current ( $V_{INH1}$ , $V_{INH2}$ )			V
DC Voltage	$V_{INH}$	-0.3 to $V_{SUP} + 0.3$	
Transient (Coupled Through 1.0 nF Capacitor, according to ISO7637-2 & ISO7637-3 & "Hardware Requirements for LIN, CAN and Flexray Interfaces in Automotive Applications" specification Rev1.1 / December 2nd, 2009) (See <a href="#">Table 4</a> and <a href="#">Figure 7</a> )			
- Pulse 1 (test up to the limit for Damage - Class D <sup>(3)</sup> )	$V_{INH(S1)}$	-100	
- Pulse 2a (test up to the limit for Damage - Class D <sup>(3)</sup> )	$V_{INH(S2a)}$	+75	
- Pulse 3a (test up to the limit for Damage - Class D <sup>(3)</sup> )	$V_{INH(S3a)}$	-150	
- Pulse 3b (test up to the limit for Damage - Class D <sup>(3)</sup> )	$V_{INH(S3b)}$	+100	

Notes

- Class D: At least one function of the Transceiver stops working properly during the test and will return into proper operation automatically when the exposure to the disturbance has ended. No physical damage of the IC occurs.

**Table 3. Maximum Ratings**

All voltages are with respect to ground unless otherwise noted. Exceeding these ratings may cause a malfunction or permanent damage to the device.

Receiver Recessive State <sup>(12)</sup>	$V_{\text{BUSREC}}$	0.6	–	–	$V_{\text{SUP}}$

**Notes**

- Parameters guaranteed for  $7.0\text{ V} \leq V_{\text{SUP}} \leq 18\text{ V}$ .
- Voltage range at the battery level, including the reverse battery diode.
- Loss of local ground must not affect communication in the residual network.
- Node has to sustain the current that can flow under this condition. The bus must remain operational under this condition.
- LIN threshold for a dominant state.
- LIN threshold for a recessive state.

**Table 5. Static Electrical Characteristics**

Characteristics noted under conditions  $7.0\text{ V} \leq V_{\text{SUP}} \leq 18\text{ V}$ ,  $-40\text{ }^{\circ}\text{C} \leq T_{\text{A}} \leq 125\text{ }^{\circ}\text{C}$ ,  $\text{GND} = 0\text{ V}$ , unless otherwise noted.  
Typical values noted reflect the approximate parameter means at  $T_{\text{A}} = 25\text{ }^{\circ}\text{C}$  under nominal conditions, unless otherwise noted.

Characteristic	Symbol	Min	Typ	Max	Unit

LIN internal capacitor <sup>(13)</sup>	$C_{\text{LIN}}$	–	–	30	pF
Over-temperature Shutdown <sup>(14)</sup>	$T_{\text{LINS D}}$	150	160	200	$^{\circ}\text{C}$
Over-temperature Shutdown Hysteresis	$T_{\text{LINS D\_HYS}}$	–	20	–	$^{\circ}\text{C}$

**INH1, INH2 OUTPUT PINS**

Driver ON Resistance (Normal Mode) $I_{\text{INH}} = 50\text{ mA}$	$\text{INH}_{\text{ON}}$	–	–	50	$\Omega$
Current load capability From $7.0\text{ V} < V_{\text{SUP}} < 18\text{ V}$	$I_{\text{INH\_load}}$	–	–	30	mA
Leakage Current (Sleep Mode) $0 < V_{\text{INH}} < V_{\text{SUP}}$	$I_{\text{LEAK}}$	-5.0	–	5.0	$\mu\text{A}$
Over-temperature Shutdown <sup>(15)</sup>	$T_{\text{INHSD}}$	150	160	200	$^{\circ}\text{C}$
Over-temperature Shutdown Hysteresis	$T_{\text{INHSD\_HYS}}$	–	20	–	$^{\circ}\text{C}$

**Notes**

13. This parameter is guaranteed by process monitoring but not production tested.
14. When an over-temperature shutdown occurs, the LIN transmitter and receiver are in recessive state and INH switched off. This parameter is tested with a test mode on ATE and characterized at laboratory.
15. When an over-temperature shutdown occurs, the INH1, INH2 high side are switched off and the LIN transmitter and receiver are in recessive state. This parameter is tested with a test mode on ATE and characterized at laboratory.

**Table 5. Static Electrical Characteristics**

Characteristics noted under conditions  $7.0\text{ V} \leq V_{\text{SUP}} \leq 18\text{ V}$ ,  $-40\text{ }^{\circ}\text{C} \leq T_{\text{A}} \leq 125\text{ }^{\circ}\text{C}$ ,  $\text{GND} = 0\text{ V}$ , unless otherwise noted.  
Typical values noted reflect the approximate parameter means at  $T_{\text{A}} = 25\text{ }^{\circ}\text{C}$  under nominal conditions, unless otherwise noted.

## FUNCTIONAL DESCRIPTION

### INTRODUCTION

The 33663L and 33663J are both a Physical Layer component dedicated to automotive LIN sub-bus applications.

The 33663L features include a 20 kbps baud rate and the 33663J a 10 kbps baud rate. Both integrate fast baud rate for test and programming modes, excellent ESD robustness, immunity against disturbance, and radiated emission performance. They have safe behavior, in case of a LIN bus short-to-ground, or a LIN bus leakage during low power mode.

Digital inputs are 5.0 and 3.3 V compatible without any external required components.

The INH1 and INH2 outputs may be used to control an external voltage regulator, or to drive a LIN bus pull-up resistor.

### FUNCTIONAL PIN DESCRIPTION

#### POWER SUPPLY PIN (VSUP)

The VSUP supply pin is the power supply pin for the 33663L or 33663J. In an application, the pin is connected to a battery through a serial diode, for reverse battery protection. The DC operating voltage is from 7.0 to 18 V. This pin sustains standard automotive condition, such as 40 V during load dump. To avoid a false bus message, an under-voltage on VSUP disables the transmission path (from TXD to LIN) when  $V_{SUP}$  falls below 6.7 V. Supply current in the Sleep mode is typically 6.0  $\mu$ A for one LIN Module.

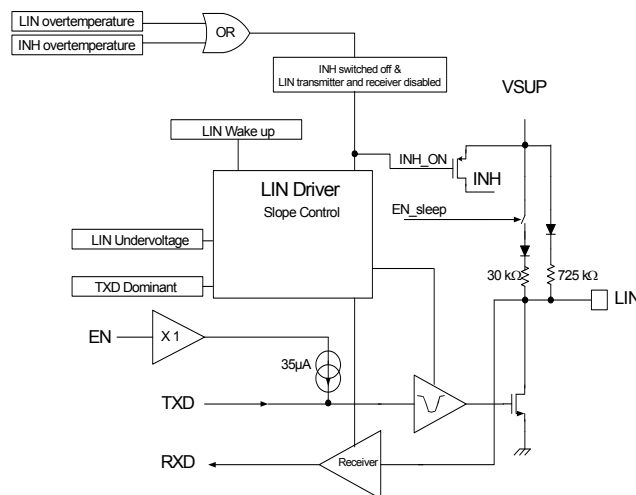

#### GROUND PIN (GND)

In case of a ground disconnection at the module level, the 33663L and 33663J do not have significant current consumption on the LIN bus pin when in the recessive state.

#### LIN BUS PIN (LIN1, LIN2)

The LIN1 and LIN2 pins represent the single-wire bus transmitter and receiver. It is suited for automotive bus systems, and is compliant to the LIN bus specification 1.3, 2.0, 2.1, and SAEJ2602-2.

The LIN interface is only active during Normal mode.

#### Transmitter Characteristics

The LIN driver is a low side MOSFET with internal over-current thermal shutdown. An internal pull-up resistor with a serial diode structure is integrated, so no external pull-up components are required for the application in a slave node. An additional pull-up resistor of 1.0 k $\Omega$  must be added when the interface is used in the master node.

The LIN pin exhibits no reverse current from the LIN bus line to  $V_{SUP}$ , even in the event of a GND shift or  $V_{SUP}$  disconnection. The 33663 is tested according to the application conditions (i.e. in normal mode and recessive state during communication).

The transmitter has a 20 kbps baud rate (Normal baud rate) for the 33663L and 33663S devices, or 10 kbps baud rate (Slow baud rate) for the 33663J device.

As soon as the device enters Normal mode, the LIN transmitter will be able to send the first dominant bit only after the  $t_{\text{FIRST\_DOM}}$  delay.  $t_{\text{FIRST\_DOM}}$  delay has no impact on the receiver. The receiver will be enabled as soon as the device enters Normal mode.

### Receiver Characteristics

The receiver thresholds are ratiometric with the device supply pin.

If the  $V_{\text{SUP}}$  voltage goes below the  $V_{\text{SUP}}$  under-voltage threshold ( $V_{\text{UVL}}$ ,  $V_{\text{UVH}}$ ), the bus LIN1 and bus LIN2 enter into a recessive state even if communication is sent to TXD1 or TXD2.

For the LIN Module 1, in case of LIN1 Thermal Shutdown, the transceiver and receiver are in recessive and INH1 turned off. When the temperature is below the  $T_{\text{LINS D}}$ , INH1 and LIN1 will be automatically enabled. The same behavior is valid for LIN Module 2.

For each LIN Module, the Fast Baud Rate selection is reported by the RXD pin. Fast Baud Rate is activated by the toggle function (See [Figure 19](#)). At the end of the toggle function, just after EN rising edge, RXD pin is kept low for  $t_5$  to flag the Fast Baud Rate entry (See [Figure 19](#)).

To exit the Fast Baud Rate and return in Normal or Slow baud rate, a toggle function is needed. At the end the toggle function, RXD pin stays high to signal Fast Baud Rate exit (See [Figure 20](#)). The device enters into Fast Baud Rate at room and hot temperature.

### DATA INPUT PINS (TXD1, TXD2)

The TXD1 and TXD2 inputs pins are the MCU interface to control the state of the LIN1 and LIN2 outputs. When TXD1 (TXD2) is LOW (dominant), LIN1 (LIN2) output is LOW; when TXD1 (TXD2) is HIGH (recessive), the LIN1 (LIN2) output transistor is turned OFF. TXD1/TXD2 pins thresholds are 3.3 V and 5.0 V compatible.

These pins have an internal pull-up current source to force the recessive state if the input pins are left floating.

If TXD1 (TXD2) stays low (dominant state) more than 5.0 ms (typical value), the LIN1 (LIN2) transmitter of LIN Module goes automatically into recessive state.

### DATA OUTPUT PINS (RXD1, RXD2)

Each LIN Modules integrate the same RXD output structure and functionality. Both pins are independent. The following description is the same for both.

RXD output pin is the MCU interface, which reports the state of the LIN bus voltage.

In Normal or Slow baud rate, LIN HIGH (recessive) is reported by a high voltage on RXD; LIN LOW (dominant) is reported by a low voltage on RXD. The RXD output structure is a tristate output buffer.

Figure 24. RXD interface

The RXD output pins are the receiver output of the LIN interface. The low level is fixed. The high level is dependent on EN voltage. If EN is set at 3.3 V, RXD  $V_{\text{OH}}$  is 3.3 V. If EN is set at 5.0 V, RXD  $V_{\text{OH}}$  is 5.0 V. The RXD1 and RXD2  $V_{\text{OH}}$  level can be defined independently.

In sleep mode, RXD are high-impedance. When a wake-up event is recognized from the WAKE pin or from the LIN bus pin, RXD is pulled LOW to report the wake-up event. An external pull-up resistor may be needed.

## ENABLE INPUT PINS (EN1, EN2)

EN1 (EN2) input pin controls the operation mode of the interface. If EN1 (EN2) = 1, the interface is in Normal mode, TXD1 (TXD2) to LIN1 (LIN2) after  $t_{FIRS\_DOM}$  delay and LIN1 (LIN2) to RXD1 (RXD2) paths are both active. EN1 (EN2) pin thresholds are 3.3 V and 5.0 V compatible. RXD1 (RXD2)  $V_{OH}$  level follows EN1 (EN2) pin high level. One LIN Module enters the Sleep Mode by setting EN1 (EN2) LOW for a delay higher than  $t_{SD}$  (70  $\mu$ s typ. value) and if the WAKE1 (WAKE2) pin state doesn't change during this delay. (see [Figure 22](#)). Both LIN Modules enter Sleep Mode if EN1 & EN2 LOW.

A combination of the logic levels on EN1 (EN2) and TXD1 (TXD2) pins allows the device to enter in Fast Baud Rate mode of operation (see [Figure 19](#)).

## INHIBIT OUTPUT PINS (INH1, INH2)

The INH1 (INH2) output pin is connected to an internal high side power MOSFET. The pin has two possible main functions. It can be used to control an external switchable voltage regulator having an inhibit input. It can also be used to drive the LIN bus external resistor in the master node application, thanks to its high drive capability. This is illustrated in [Figure 26](#).

In Sleep mode, INH1 (INH2) is turned OFF. If a voltage regulator inhibit input is connected to INH1 (INH2), the regulator will be disabled. If the master node pull-up resistor is connected to INH1 (INH2), the pull-up resistor will be unpowered and left floating.

In case of a INH1 (INH2) thermal shutdown, the high side is turned off and the LIN1 (LIN2) transmitter and receiver are in recessive state. An external 10 to 100 pF capacitor on INH1 (INH2) pin is advised in order to improve EMC performances.

## WAKE INPUT PINS (WAKE1, WAKE2)

The WAKE1 (WAKE2) pin is a high-voltage input used to wake-up the device from the Sleep mode. WAKE1 (WAKE2) is usually connected to an external switch in the application.

The WAKE1 (WAKE2) pin has a special design structure and allows wake-up from both HIGH to LOW or LOW to HIGH transitions. When entering into Sleep mode, the corresponded LIN Module monitors the state of its WAKE pin and stores it as a reference state. The opposite state of this reference state will be the wake-up event used by the LIN Module to enter again into Normal mode.

If the WAKE1 (WAKE2) pin state changes during the Sleep mode Delay Time ( $t_{SD}$ ) or before EN1 (EN2) goes low with a deglitcher lower than  $t_{WF}$ , the LIN Module will not enter in Sleep mode, but will go into Awake mode (See [Figure 23](#)).

An internal filter is implemented to avoid false wake-up event due to parasitic pulses (See [Figure 16](#)). WAKE1 (WAKE2) pin input structure exhibits a high-impedance, with extremely low input current when voltage at this pin is below 27 V. Two serial resistors should be inserted in order to limit the input current mainly during transient pulses and ESD. The total recommended resistor value is 33 k $\Omega$ . An external 10 to 100 nF capacitor is advised for better EMC and ESD performances.

**Important** The WAKE1 (WAKE2) pin should not be left open. If the wake-up function is not used, WAKE1 (WAKE2) should be connected to ground to avoid a false wake-up.

## FUNCTIONAL DEVICE OPERATION

### OPERATIONAL MODES

As described by the following, the 33663L, 33663J, and 33663S have two operational modes, Normal and Sleep. In addition, there are two transitional modes: Awake mode which allows the device to go into Normal mode, and Preparation to Sleep mode which allows the device to go into Sleep mode.

#### NORMAL OR SLOW BAUD RATE

In the Normal mode, the LIN bus can transmit and receive information.

The 33663L and 33663S (20 kbps) have a slew rate and timing compatible with Normal Baud Rate and LIN protocol specification 1.3, 2.0, 2.1, and 2.2.

The 33663J (10 kbps) has a slew rate and timing compatible with Low Baud Rate.

From Normal mode, the three devices can enter into Fast Baud Rate (Toggle function).

#### FAST BAUD RATE

In fast baud rate, the slew rate is around 10 times faster than the normal baud rate. This allows very fast data transmission (> 100 kbps) -- for example, electronic control unit (ECU) tests and microcontroller program download. The bus pull-up resistor might be adjusted to ensure a correct RC time constant in line with the high baud rate used.

The following sequence is applicable to both LIN Modules independently.

Fast baud rate is entered via a special sequence (called toggle function) as follows:

1. EN1 pin set LOW while TXD1 is HIGH
2. TXD1 stays HIGH for 12.5  $\mu$ s min
3. TXD1 set LOW for 12.5  $\mu$ s min
4. TXD1 pulled HIGH for 12.5  $\mu$ s min
5. EN1 pin set LOW to HIGH while TXD1 still HIGH

The LIN Module enters into the fast baud rate if the delay between step 1 to step 5 is 45  $\mu$ s maximum. The toggle function is described in [Figures 19](#). Once in fast baud rate, the same toggle function just described previously is used to bring the LIN Module 1 back into normal baud rate.

Fast baud rate selection is reported to the MCU by the RXD1 pin. Once the LIN Module 1 enters in this fast baud rate, the RXD1 pin goes at low level for  $t_{\text{S}}$ . When LIN Module 1 returns to normal baud rate with the same toggle function, the RXD1 pin stays high. Both sequences are illustrated in [Figures 19](#) and [20](#).

#### PREPARATION TO SLEEP MODE

The following sequence is applicable to both LIN Modules simultaneously or separately. Here it is detailed with the LIN Module 1.

To enter the Preparation to Sleep mode, EN1 must be low for a delay higher than  $t_{\text{LWUE}}$ .

- If the WAKE1 pin state doesn't change during  $t_{\text{SD}}$  and  $t_{\text{LWUE}}$ , then the LIN Module 1 goes in Sleep Mode.
- If the WAKE1 pin state changes during  $t_{\text{SD}}$  and if  $t_{\text{WF}}$  is reached after end of  $t_{\text{SD}}$ , then the LIN Module 1 goes into Sleep mode after the end of  $t_{\text{SD}}$  timing.
- If the WAKE1 pin state changes during  $t_{\text{SD}}$  and  $t_{\text{WF}}$  delay has been reached before end of  $t_{\text{SD}}$ , then the LIN Module 1 goes into Awake Mode.
- If the WAKE1 pin state changes before  $t_{\text{SD}}$  and the delay  $t_{\text{WF}}$  ends during  $t_{\text{SD}}$ , then the LIN Module 1 goes in Awake Mode.
- If EN1 goes high for a delay higher than  $t_{\text{LWUE}}$ , the LIN Module 1 returns in Normal mode.

#### SLEEP MODE

The following Sleep mode paragraph is applicable to both LIN Modules simultaneously or separately. LIN Module 1 is an example.

To enter into Sleep mode, EN1 must be low for a delay longer than  $t_{\text{SD}}$  and the WAKE1 pin must stay in the same state (High or Low) during this delay. The LIN Module 1 conditions to not enter Sleep mode, but enter Awake mode are detailed in the Preparation into Sleep Mode chapter. See [Figure 23](#).

In Sleep mode, the transmission path is disabled and the LIN Module 1 is in Low Power mode. Supply current from  $V_{SUP}$  is very low. Wake-up can occur from LIN1 bus activity, from the EN1 pin and from the WAKE1 input pin. If during the preparation to Sleep mode delay ( $t_{SD}$ ), the LIN1 bus goes low due to LIN1 network communication, the LIN Module 1 still enters Sleep mode. The LIN Module 1 can be awakened by a recessive to dominant start, followed by a dominant to recessive state after  $t > t_{WUF}$ .

After a wake-up event, the LIN Module 1 enters into Awake mode. In Sleep mode, the LIN Module 1 internal 725 kOhm pull-up resistor is connected and the 30 kOhm is disconnected.

### DEVICE POWER-UP (Awake Transitional Mode)

At power-up ( $V_{SUP}$  rises from zero), when  $V_{SUP}$  is above the Power-On Reset voltage, both LIN Modules automatically switch after a 160  $\mu s$  delay time to the Awake transitional mode. Both INH pins (INH1 and INH2) go to a HIGH state and RXD1 and RXD2 to a LOW state. See [Figure 21](#).

### DEVICE WAKE-UP EVENTS

The 33663L, 33663J and 33663S can be awakened from Sleep mode by three wake-up events:

- Remote wake-up via LIN1 and/or LIN2 bus activity
- Via the EN1 and/or EN2 pin
- Toggling the WAKE1 and/or WAKE2 pin

### Remote Wake from LIN1, LIN2 Bus (Awake Transitional Mode)

Each LIN Transceiver is awakened by its LIN dominant pulse longer than  $t_{WUF}$ . Dominant pulse means: a recessive to dominant transition, wait for  $t > t_{WUF}$ , then a dominant to recessive transition. This is illustrated in [Figure 15](#). Once the wake-up is detected (during the dominant to recessive transition), the LIN Module waken up by its LIN enters into Awake mode, with its INH HIGH and RXD pulled LOW.

Once in the Awake mode, its EN pin has to be set to 3.3 V or 5.0 V (depending on the system) to enter into Normal mode. Once in Normal mode, the LIN Module has to wait  $t_{FIRST\_DOM}$  delay before transmitting the first dominant bit.

### Wake-up from EN1, EN2 pins

Each LIN Module can be awakened by a LOW to HIGH transition of its EN pin. When EN is switched from LOW to HIGH and stays HIGH for a delay higher than  $t_{LWUE}$ , the LIN Module is awakened and enters into Normal mode. See [Figure 14](#). Once in Normal mode, the LIN Module has to wait  $t_{FIRST\_DOM}$  delay before transmitting the first dominant bit.

### Wake-up from WAKE1, WAKE2 Pins (Awake Transitional Mode)

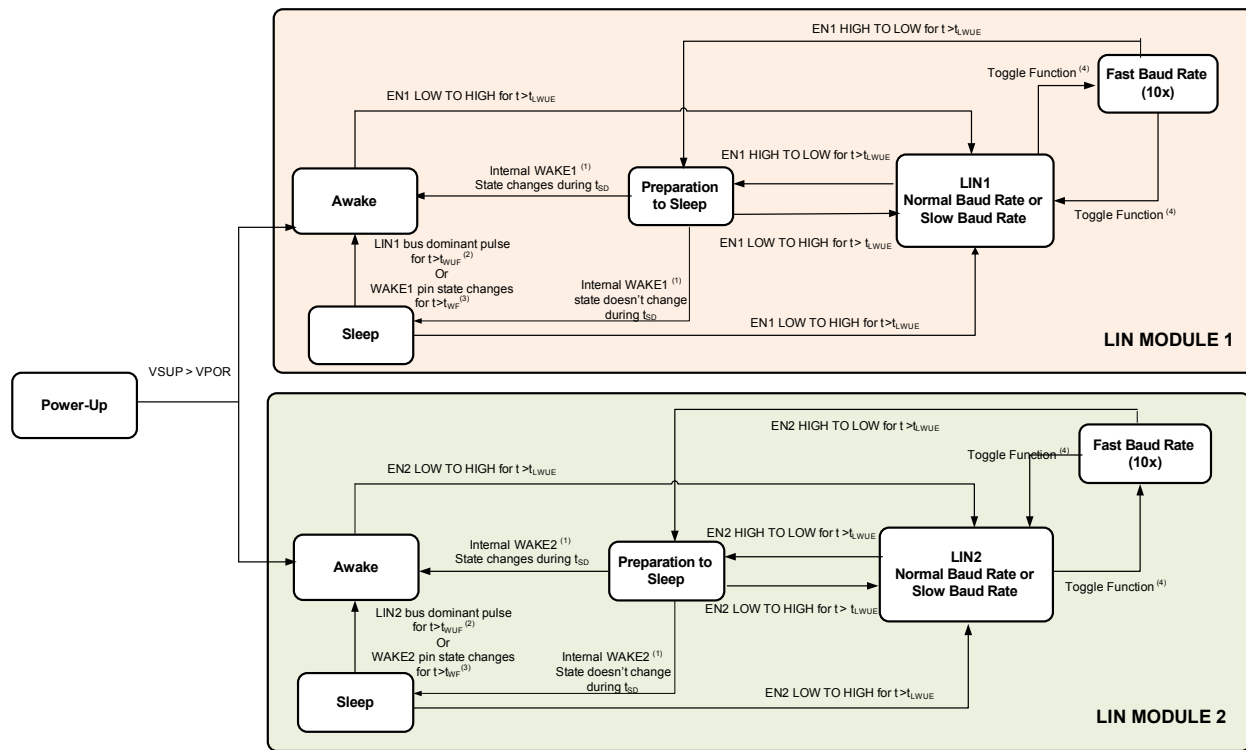

Just before entering the Sleep mode, the WAKE pin state of the concerned LIN Module is stored. A change in the level longer than the deglitcher time (70  $\mu s$  maximum) will generate a wake-up, and the LIN Module enters into the Awake Transitional mode, with its INH HIGH and RXD pulled LOW. See [Figure 16](#). The LIN Module goes into Normal mode when its EN is switched from LOW to HIGH and stays HIGH for a delay higher than  $t_{LWUE}$ . Once in Normal mode, the LIN Module has to wait  $t_{FIRST\_DOM}$  delay before transmitting the first dominant bit.

## FAIL-SAFE FEATURES

[Tables 7](#) describes the 33663 protections.

**Table 7. Fail Safe Features**

BLOCK	FAULT	FUNCTIONAL MODE	CONDITION	FALLOUT	RECOVERY CONDITION	RECOVERY FUNCTIONALITY MODE
Power Supply	Power on Reset (POR)	All modes	$V_{SUP} < 3.5 \text{ V}$ (min) then power up	No internal supplies	Condition gone	Device goes in Awake mode whatever the previous device mode
INH1 INH2	INH1 AND/OR INH2 Thermal Shutdown. Each LIN Module has its own INH Thermal Shutdown.	For the failed LIN Module: Normal, Awake & Preparation to Sleep modes	Temperature $> 160 \text{ }^{\circ}\text{C}$ (typ)	INH high side of the failed LIN Module turned off and its LIN transmitter and receiver in recessive State	Condition gone	LIN Module returns in same functional mode
LIN1 LIN2	$V_{SUP}$ under-voltage	Normal	$V_{SUP} < V_{UVL}$	Both LIN transmitters in recessive state	Condition gone	Device returns in same functional mode
	TXD1 AND/OR TXD2 Pins Permanent Dominant		TXD pin low for more than 5.0 ms (typ)	LIN transmitter of the failed LIN Module in recessive state	Condition gone	LIN Module returns in same functional mode
	LIN1 AND/OR LIN2 Thermal Shutdown. Each LIN Module has its own LIN Thermal Shutdown.	Normal mode	Temperature $> 160 \text{ }^{\circ}\text{C}$ (typ)	LIN transmitter and receiver of the failed LIN Module in recessive state and its INH high side turned off	Condition gone	LIN Module returns in same functional mode

<sup>(1)</sup>: Internal WAKE is the WAKE signal filtered by  $t_{WF}$  (WAKE deglitcher)  
<sup>(2)</sup>: see figures 15 and 18  
<sup>(3)</sup>: see figures 14 and 17  
<sup>(4)</sup>: the Toggle Function is guaranteed at ambient and hot temperature

Figure 25. Operational and Transitional Modes State

Table 7. Explanation of Operational and Transitional Modes State Diagram (each transceiver)

Operational/ Transitional	LIN1, LIN2	INH1 INH2	EN1 EN2	TXD1, TXD2	RXD1, RXD2
Sleep Mode	Recessive state, driver off with 725 k $\Omega$ pull-up.	OFF (low)	LOW	X	High-impedance. HIGH if external pull-up to $V_{DD}$ .
Awake	Recessive state, driver off. 725 k $\Omega$ pull-up active.	ON (high)	LOW	X	LOW. If external pull-up, HIGH-to-LOW transition reports wake-up.
Preparation to Sleep Mode	Recessive state, driver off with 725 k $\Omega$ pull-up	ON (high)	LOW	X	High-impedance. HIGH if external pull-up to $V_{DD}$ .
Normal Mode	Driver active. 30 k $\Omega$ pull-up active. Normal Baud Rate for 33662L and 33662S Slow Baud Rate for 33662J Fast Baud Rate (> 100 kbps) for 33662L, 33662S & 33662J	ON (high)	HIGH	LOW to drive LIN bus in dominant HIGH to drive LIN bus in recessive.	Report LIN bus state: • Low LIN bus dominant • High LIN bus recessive

X = Don't care.

### COMPATIBILITY WITH LIN1.3

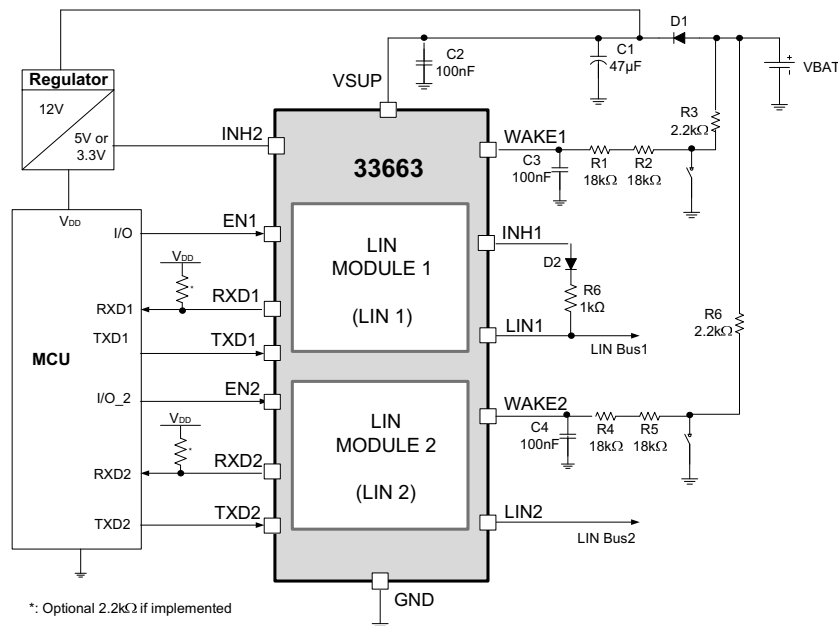

Following the Consortium LIN specification Package, Revision 2.1, November 24, 2006, Chapter 1.1.7.1 Compatibility with LIN1.3 page 15:

The LIN 2.1 physical layer and is backward compatible with the LIN 1.3 physical layer, but not the other way around. The LIN 2.1 physical layer sets harder requirements, i.e. a node using the LIN 2.1 physical layer can operate in a LIN 1.3 cluster.

## TYPICAL APPLICATION

The 33663 can be configured for several applications. The figure below shows LIN2 as a slave node and LIN1 as a master node application. An additional pull-up resistor of 1.0 k $\Omega$  in series with a diode must be added when the device is used in the master node.

### Figure 26. 33663 Typical Application

## PACKAGING

### PACKAGE DIMENSIONS

**Important** For the most current revision of the package, visit [www.Freescale.com](http://www.Freescale.com) and do a keyword search on the 98A. Dimensions shown are provided for reference ONLY.

© FREESCALE SEMICONDUCTOR, INC. ALL RIGHTS RESERVED.	<b>MECHANICAL OUTLINE</b>	PRINT VERSION NOT TO SCALE
TITLE: 14LD SOIC N/B, 1.27 PITCH CASE-OUTLINE	DOCUMENT NO: 98ASB42565B	REV: J
	CASE NUMBER: 751A-04	04 DEC 2007
	STANDARD: JECDEC MS-012AB

REVISION J

NOTES:

1. DIMENSIONS ARE IN MILLIMETERS.
2. DIMENSIONING AND TOLERANCING PER ASME Y14.5M-1994.
3. DATUMS A AND B TO BE DETERMINED AT THE PLANE WHERE THE BOTTOM OF THE LEADS EXIT THE PLASTIC BODY. DATUM T IS A SURFACE.
4. THIS DIMENSION DOES NOT INCLUDE MOLD FLASH, PROTRUSION OR GATE BURRS. MOLD FLASH, PROTRUSION OR GATE BURRS SHALL NOT EXCEED 0.15 MM PER SIDE. THIS DIMENSION IS DETERMINED AT THE PLANE WHERE THE BOTTOM OF THE LEADS EXIT THE PLASTIC BODY.
5. THIS DIMENSION DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.127 TOTOAL IN EXCESS OF THE LEAD WIDTH AT MAXIMUM MATERIAL CONDITION.
