- NOTES:**
- The reference inductance at rated DC current is a typical value.
 - Temperature rise is 50°C in typical buck or boost circuits at 250kHz and with the reference ET applied to the inductor.
 - Total loss in the inductor is 380mW for 50°C temperature rise above ambient.
 - To estimate temperature rise in a given application, determine copper and core losses, divide by 380 and multiply by 50.
 - For the copper loss, calculate $I_{DC}^2 \times R_{DC}$.
 - For core loss, using frequency (f) and operating flux density (B), calculate $6.11 \times 10^{-18} \times B^{2.7} \times f^{2.04}$.
 - For flux density (B), calculate ET (V-μsec) for the application, divide by ET₁₀₀ from the table, and multiply by 100.
 - Limit the DC bias (H) to 46 orsted. Calculate H by multiplying H₁ from the table by I_{DC} of the application.
 - Optional Tape & Reel packaging can be ordered by adding a "T" suffix to the part number (i.e. PL8500 becomes PL8500T). Pulse complies to industry standard tape and reel specification EIA481.
