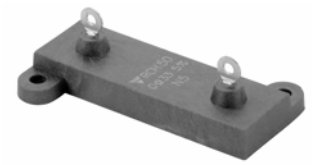
Power Resistor, for Mounting onto a Heatsink Thick Film Technology



FEATURES

- 5 W to 50 W
- High power rating
- High overload capabilities up to 2500 V_{RMS}
- Wide resistance range from 0.24 MΩ to 1 MΩ
- High thermal capacity up to 0.8 °C/W
- Easy mounting
- Reduced size and weight
- High insulation: 10^6 MΩ
- Compliant to RoHS directive 2002/95/EC

RoHS COMPLIANT

Manufactured in cermet thick film technology, these power resistors exhibit remarkable characteristics and the series includes 4 types ranging from 5 W to 50 W.
Designed to be mounted onto a heatsink, the resistors can bear high short time overloads and 3 types of terminations are available.
The resistors are non inductive and are particularly suitable for high frequency operation and cut-out circuits.

RECOMMENDATIONS FOR MOUNTING ONTO A HEATSINK

- Surfaces in contact must be carefully cleaned.
- The heatsink must have an acceptable flatness: From 0.05 mm to 0.1 mm/100 mm.
- Roughness of the heatsink must be around 6.3 µm. In order to improve thermal conductivity, surfaces in contact (alumina, heatsink) are coated with a silicone grease (type SI 340 from Rhône-Poulenc or Dow 340 from Dow Corning).
- The fastening of the resistor to the heatsink is under pressure control of two screws (not supplied).

Tightening Torque on heatsink	RCH 5	RCH 10	RCH 25	RCH 50
	0.5 Nm	0.6 Nm	0.7 Nm	1 Nm

- In order to improve the dissipation, either forced-air cooling or liquid cooling may be used.
- A low thermal radiation of the case allows several resistors to be mounted onto the same heatsink.
- Do not forget to respect an insulation value between two resistors (dielectric strength in dry air 1 kV/mm).
- In any case the hot spot temperature, measured locally on the case must not exceed 125 °C.
- Tests should be performed by the user.

CHOICE OF THE HEATSINK

The user must choose the heatsink according to working conditions of the component (power, room temperature). Maximum working temperature must not exceed 125 °C. The dissipated power is simply calculated by the following ratio:

$$P = \frac{\Delta T}{[R_{TH\ (j-c)} + R_{TH\ (c-a)}]} \quad (1)$$

P: Expressed in W

ΔT: Difference between maximum working temperature and room temperature.

$R_{TH\ (j-c)}$: Thermal resistance value measured between resistance layer and outer side of the resistor.
It is the thermal resistance of the component (See Special Features table).

$R_{TH\ (c-a)}$: Thermal resistance value measured between outer side of the resistor and room temperature.
It is the thermal resistance of the heatsink depending on the heatsink itself (type, shape) and the quality of the fastening device.

Example:

$R_{TH\ (c-a)}$: For RCH 25 power rating 20 W at ambient temperature + 50 °C.

$\Delta T \leq 125\ °C - 50\ °C \leq 75\ °C$

$R_{TH\ (j-c)} = 1.4\ °C/W$ (Special Features)

$R_{TH\ (j-c)} + R_{TH\ (c-a)} = \frac{\Delta T}{P} = \frac{75}{20} = 3.75\ °C/W$

$R_{TH\ (c-a)} \leq 3.75\ °C/W - 1.4\ °C/W \leq 2.35\ °C/W$

OVERLOADS

The applied voltage must always be lower than the maximum overload voltage as shown in the special features table.
The values indicated on the graph below are applicable to resistors in air or mounted onto a heatsink.

POWER RATING

For resistors mounted onto heatsink and thermal resistance of 1 °C/W.
To improve the thermal conductivity, surfaces in contact should be coated with a silicone grease.
