RPA120H-RW

**120 Watt
Half Brick
Single Output**

Description

The RPA120H series are high power, 110VDC wide input range 120W DC/DC converters in an industry standard half brick format. Despite their low cost, the RPA120H converters are fully specified devices with output currents up to 8.3Amps, up to 88.5% efficiency, no minimum load, 3kVDC isolation, tight regulation and low ripple/noise figures. The trimmable outputs are also fully protected against over-temperature, short circuits, overcurrent and overvoltage. The converters are UL60950-1 and IEC/EN60950-1 certified and EN50155 pending and will find many uses in cost sensitive railway and industrial applications.

OUTPUT TRIM

Output Voltage Trimming

RPA120H-RW converters offer the feature of trimming the output voltage over a certain range around the nominal value by using external trim resistors. The values for trim resistors shown in trim tables below are according to standard E96 values; therefore, the specified voltage may slightly vary; they also can be calculated with below shown equation.

TRIM UP

TRIM DOWN

Trim Calculation

$$R_1 = \frac{\left[V_{out} \cdot \frac{(100 + \Delta V_{out})}{100} - 2.5 \right] \cdot 120}{V_{out} \cdot \frac{\Delta V_{out}}{100} \cdot 2.5} - 10$$

$$R_2 = \frac{10 \cdot V_{out} \cdot \frac{(100 + \Delta V_{out})}{100}}{V_{out} - V_{out} \cdot \frac{(100 - \Delta V_{out})}{100}}$$

V_{out} = Output Voltage

ΔV_{out} = Output Voltage Change in %

R_1 = trim up resistor

R_2 = trim down resistor

Practical Example:

Trim Up:

$V_{out} = 12\text{V}$, $\Delta V_{out} = +10\%$ (13.2V)

$$R_1 = \frac{\left[12 \cdot \frac{(100 + 10)}{100} - 2.5 \right] \cdot 120}{12 \cdot \frac{10}{100} \cdot 2.5} - 10 = \frac{1284}{3} - 10 = 418\text{k}\Omega$$

Trim down:

$V_{out} = 12\text{V}$, $\Delta V_{out} = -10\%$ (10.8V)

$$R_2 = \frac{10 \cdot 12 \cdot \frac{(100 - 10)}{100}}{12 - 12 \cdot \frac{(100 - 10)}{100}} = \frac{10 \cdot 12 \cdot 0.9}{12 - 12 \cdot 0.9} = \frac{108}{1.2} = 90\text{k}\Omega$$

$$R_{th\text{case-ambient}} = 3.8^\circ\text{C/W (vertical)}$$

$$R_{th\text{case-ambientHC}} = 2.5^\circ\text{C/W (vertical)}$$

$$R_{th\text{case-ambient}} = \frac{T_{\text{case}} - T_{\text{ambient}}}{P_{\text{dissipation}}}$$

P_{IN}	=	Input Power
P_{OUT}	=	Output Power
η	=	Efficiency under given Operating Conditions
$R_{th\text{case-ambient}}$	=	Thermal Impedance

Practical Example:

Take the RPA120H-11015SRW with 53V input Voltage and 50% load. What is the maximum ambient operating temperature? Use converter vertical in application with 1.5m/s airflow.

$$\begin{aligned} \text{Eff}_{\min} &= 88.5\% @ V_{\text{nom}} \\ P_{\text{OUT}} &= 100\text{W} \\ P_{\text{OUTapp}} &= 100.5 \times 0.5 = 50.25\text{W} \\ \eta &= 88\% \text{ (Efficiency vs. Load Graph)} \\ P_{\text{dissipation}} &= \frac{50.25}{0.88} - 50.25 = 6.9\text{W} \end{aligned}$$

without Heat-sink

$$R_{th} = \frac{T_{\text{casemax}} - T_{\text{amb}}}{P_{\text{dissipation}}} \rightarrow 3.8^\circ\text{C/W} = \frac{100 - T_{\text{amb}}}{6.9\text{W}}$$

$$T_{\text{amb}} = 73^\circ\text{C}$$

with Heat-sink

$$R_{th\text{HC}} = \frac{T_{\text{casemax}} - T_{\text{amb}}}{P_{\text{dissipation}}} \rightarrow 2.5^\circ\text{C/W} = \frac{100 - T_{\text{amb}}}{6.9}$$

$$T_{\text{ambHC}} = 82^\circ\text{C}$$
