RPA120H-RW

120 Watt Half Brick Single Output

3 YEAR warranty

Description

The RPA120H series are high power, 110VDC wide input range 120W DC/DC converters in an industry standard half brick format. Despite their low cost, the RPA120H converters are fully specified devices with output currents up to 8.3Amps, up to 88.5% efficiency, no minimum load, 3kVDC isolation, tight regulation and low ripple/noise figures. The trimmable outputs are also fully protected against over-temperature, short circuits, overcurrent and overvoltage. The converters are UL60950-1 and IEC/EN60950-1 certified and EN50155 pending and will find many uses in cost sensitive railway and industrial applications.

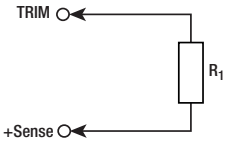
OUTPUT TRIM

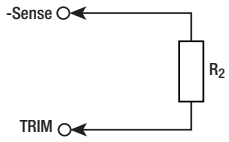
Output Voltage Trimming

RPA120H-RW converters offer the feature of trimming the output voltage over a certain range around the nominal value by using external trim resistors. The values for trim resistors shown in trim tables below are according to standard E96 values; therefore, the specified voltage may slightly vary; they also can be calculated with below shown equation.

TRIM UP



TRIM DOWN



Trim Calculation

$$R_1 = \frac{\left[Vout * \frac{(100+\Delta Vout)}{100} - 2.5 \right] * 120}{Vout * \frac{\Delta Vout}{100} * 2.5} - 10$$

$$R_2 = \frac{10 * Vout * \frac{(100+\Delta Vout)}{100}}{Vout - Vout * \frac{(100-\Delta Vout)}{100}}$$

Vout = Output Voltage
ΔVout = Output Voltage Change in %
R1 = trim up resistor
R2 = trim down resistor

Practical Example:

Trim Up:

Vout = 12V, ΔVout = +10% (13.2V)

$$R_1 = \frac{\left[12 * \frac{(100+10)}{100} - 2.5 \right] * 120}{12 * \frac{10}{100} * 2.5} \quad -10 = \frac{1284}{3} - 10 = 418k\Omega$$

Trim down:

Vout = 12V, ΔVout = -10% (10.8V)

$$R_2 = \frac{10 * 12 * \frac{(100-10)}{100}}{12 - 12 * \frac{(100-10)}{100}} = \frac{10*12*0.9}{12-12*0.9} = \frac{108}{1.2} = 90k\Omega$$

Thermal Calculation

$R_{thcase\text{-}ambient}$ = 3.8°C/W (vertical)
$R_{thcase\text{-}ambientHC}$ = 2.5°C/W (vertical)

$$R_{thcase\text{-}ambient} = \frac{T_{case} - T_{ambient}}{P_{dissipation}}$$

$$P_{dissipation} = P_{IN} - P_{OUT} = \frac{P_{OUTapp}}{\eta} - P_{OUTapp}$$

T_{case} = Case Temperature
$T_{ambient}$ = Environment Temperature
$P_{dissipation}$ = Internal losses
P_{IN} = Input Power
P_{OUT} = Output Power
η = Efficiency under given Operating Conditions
$R_{thcase\text{-}ambient}$ = Thermal Impedance

Practical Example:
Take the RPA120H-11015SRW with 53V input Voltage and 50% load. What is the maximum ambient operating temperature? Use converter vertical in application with 1.5m/s airflow.

Eff_{min} = 88.5% @ V_{nom}
P_{OUT} = 100W
P_{OUTapp} = 100.5 x 0.5 = 50.25W
η = 88% (Efficiency vs. Load Graph)

$$P_{dissipation} = \frac{50.25}{0.88} - 50.25 = 6.9W$$

without Heat-sink

$$R_{th} = \frac{T_{casemax} - T_{amb}}{P_{dissipation}} \text{ --> } 3.8°C/W = \frac{100\text{-}T_{amb}}{6.9W}$$

T_{amb} = 73°C

with Heat-sink

$$R_{thHC} = \frac{T_{casemax} - T_{amb}}{P_{dissipation}} \text{ --> } 2.5°C/W = \frac{100\text{-}T_{amb}}{6.9}$$

T_{ambHC} = 82°C
