

## 1.5A Low Dropout Voltage Regulator

### FEATURES

- Adjustable Output Down to 1.25V
- 1% Output Accuracy
- Output Current of 1.5A
- Low Dropout Voltage of 390mV @ 1.5A
- Extremely Tight Load and Line Regulation
- Extremely Fast Transient Response
- Reverse-Battery Protection
- Zero Current Shutdown (5 pin version)
- Error Flag Signal Output for Out of Regulation State (5 pin version)
- Standard TO-220 and TO-263 Packages

### APPLICATIONS

- Powering VGA and Sound Cards
- LCD Monitors
- USB Power Supplies
- PowerPC™ Supplies
- SMPS Post Regulators
- High-efficiency "Green" Computer Systems
- High-efficiency Linear Power Supplies
- Portable Instrumentation
- Constant Current Regulators
- Adjustable Power Supplies
- Battery Chargers

---

### DESCRIPTION

The SPX29150/51/52/53 are 1.5A, highly accurate voltage regulators with a low dropout voltage of 390mV (typical) @ 1.5A. These regulators are specifically designed for low voltage applications that require a low dropout voltage and a fast transient response. They are fully fault protected against over-current, reverse battery, and positive and negative voltage transients. On-chip trimming adjusts the reference voltage to 1% initial accuracy. Other features in the 5 pin versions include Enable and Error Flag.

The SPX29150/51/52/53 is offered in 3-pin and 5-pin TO-220 & TO-263 packages. For a 3A version, refer to the SPX29300 data sheet.

---

### TYPICAL APPLICATION CIRCUITS

### NOTES:

Note 1: Dropout voltage is defined as the input to output differential when the output voltage drops to 99% of its nominal value.

Note 2: V<sub>IN</sub> = V<sub>OUT</sub> (NOMINAL) +1V. For example, use V<sub>IN</sub> = 4.3V for a 3.3V regulator. Employ pulse-testing procedures to minimize temperature rise.

Note 3: Ground pin current is the regulator quiescent current. The total current drawn from the source is the sum of the load current to the ground current.

Note 4: Thermal regulation is defined as the change in the output voltage at a time T after a change in power dissipation is applied, excluding load or line regulation effects.

Note 5: Comparator threshold is expressed in terms of a voltage differential at the Adjust terminal below the nominal reference voltage measured 6V input. To express these thresholds in terms of output voltage change, multiply the error amplifier gain = V<sub>OUT</sub>/V<sub>REF</sub> = (R1 + R2)/R2. For example, at a programmable output voltage of 5V, the Error output is guaranteed to go low when the output drops by 95mVx 5V/ 1.240V = 38mV. Thresholds remain constant as a percent of V<sub>OUT</sub> as V<sub>OUT</sub> is varied, with the dropout warning occurring at typically 5% below nominal, 7.7% guaranteed.

Note 6: V<sub>EN</sub> ≤ 0.8V and V<sub>IN</sub> ≤ 16V, V<sub>OUT</sub> = 0.

Note 7: Maximum positive supply voltage of 20V must be of limited duration (<100m\_s) < 1%. The maximum continuous supply voltage is 16V.

Note 8: V<sub>REF</sub> ≤ V<sub>OUT</sub> ≤ (V<sub>IN</sub>-1), 2.5V ≤ V<sub>IN</sub> ≤ 16V, 10mA ≤ I<sub>L</sub> ≤ I<sub>FL</sub>, T<sub>J</sub> < T<sub>JMAX</sub>.

The SPX29150/51/52/53 incorporates protection against over-current faults, reversed load insertion, over temperature operation, and positive and negative transient voltages.

### Thermal Considerations

Although the SPX29150/51/52/53 offers limiting circuitry for overload conditions, it is still necessary to insure that the maximum junction temperature is not exceeded in the application. Heat will flow through the lowest resistance path, the junction-to-case path. In order to insure the best thermal flow of the component, proper mounting is required. Consult the heatsink manufacturer for thermal resistance and heat sink design.

### TO-220 Design Example:

Assume that  $V_{IN} = 10V$ ,  $V_{OUT} = 5V$ ,  $I_{OUT} = 1.5A$ ,  $T_A = 50^\circ C$ ,  $\theta_{HA} = 1^\circ C/W$ ,  $\theta_{CH} = 2^\circ C/W$ , and  $\theta_{JC} = 3^\circ C/W$ , where:

$T_A$  = ambient temperature,

$\theta_{HA}$  = heatsink to ambient thermal resistance

$\theta_{CH}$  = case to heatsink thermal resistance

$\theta_{JC}$  = junction to case thermal resistance

The power calculated under these conditions is:

$$P_D = (V_{IN} - V_{OUT}) * I_{OUT} = 7.5W.$$

And the junction temperature is calculated as

$$T_J = T_A + P_D * (\theta_{HA} + \theta_{CH} + \theta_{JC}) \text{ or}$$

Figure 19. Fixed Output Linear Regulator

$$T_J = 50 + 7.5 * (1+2+3) = 95^\circ C$$

Reliable operation is insured.

### Capacitor Requirements

The output capacitor is needed to insure stability and minimize the output noise. The value of the capacitor varies with the load. However, a minimum value of  $10\mu F$  aluminum capacitor will guarantee stability over all load conditions. Atantalam capacitor is recommended if a faster load transient response is needed. If the power source has a high AC impedance, a  $0.1\mu F$  ceramic capacitor between input & ground is recommended. The output capacitors maximum ESR value for stable operation is 0.33ohms.

### Minimum Load Current

To ensure proper behavior of the regulator under light loads, a minimum load of 5mA for SPX29150/51/52/53 is required.

### Typical Application Circuits

Figure 19 represents a typical fixed output regulator. Figure 20 represents an adjustable output regulator. The values of R1 and R2 set the output voltage value as follows:  $V_{OUT} = V_{REF} * [1 + (R1/R2)]$ . A minimum value of  $10k\Omega$  is recommended for R2 with a range between  $10k\Omega$  and  $47k\Omega$ .
